1.0 INTRODUCTION

1.1 PURPOSE OF THE RESPONSE TO COMMENTS DOCUMENT

This document has been prepared to respond to comments received on the Recirculated Draft Environmental Impact Report (Recirculated Draft EIR) prepared for the proposed 2740 West Nielsen Office/Warehouse Project (Development Permit Application No. P21-02699 and Tentative Parcel Map Application No. P21 05930) (herein referred to as the proposed project) for the City of Fresno (City). The Recirculated Draft EIR identifies the likely environmental consequences associated with development of the proposed project and recommends mitigation measures to reduce potentially significant impacts. This Response to Comments (RTC) Document provides responses to comments on the Recirculated Draft EIR and makes revisions to the Recirculated Draft EIR, as necessary, resulting from those comments or to clarify material in the Recirculated Draft EIR. This document, together with the Recirculated Draft EIR, constitutes the Final EIR for the proposed project.

1.2 ENVIRONMENTAL REVIEW PROCESS

According to the California Environmental Quality Act (CEQA), lead agencies are required to consult with public agencies having jurisdiction over a proposed project and to provide the general public with an opportunity to comment on the Recirculated Draft EIR.

On September 9, 2022, the City circulated a Notice of Preparation (NOP) notifying responsible agencies and interested parties that an EIR would be prepared for the proposed project and indicated the environmental topics anticipated to be addressed in the EIR. The NOP was sent to the State Clearinghouse, responsible agencies, interested parties, and organizations likely to be interested in the potential impacts of the proposed project. A scoping session was held virtually on September 22, 2022, to solicit feedback regarding the scope and content of the EIR. Comments received by the City on the NOP were considered during preparation of the Draft EIR.

The Draft EIR was made available for public review on February 24, 2023, and was distributed to local and State responsible and trustee agencies. The Draft EIR and an announcement of its availability were posted electronically on the City's website at: https://www.fresno.gov/darm/planning-development/plans-projects-under-review. The Notice of Availability (NOA) for the Draft EIR was submitted to the State Clearinghouse, provided to all individuals and organizations who made a written request for notice, and filed with the Fresno County Clerk. In addition, the City issued a Recirculated EIR on April 4, 2023, that included Chapters 6.0 and 7.0, which were previously omitted from the Draft EIR. No other changes were made to the Draft EIR.

The CEQA-mandated 45-day public comment period ended on May 19, 2023. The City accepted and responded to all comments received between February 24, 2023, and May 19, 2023. Copies of all written comments received during the comment period are included in Chapter 3.0, Comments and Responses, of this document.

1.3 DOCUMENT ORGANIZATION

This RTC Document consists of the following chapters:

- **Chapter 1.0: Introduction.** This chapter discusses the purpose and organization of this RTC Document and the Final EIR, and summarizes the environmental review process for the project.

- **Chapter 2.0: List of Commenters.** This chapter contains a list of agencies and individuals who submitted written comments during the public review period and comments made at the public hearing on the Recirculated Draft EIR.

- **Chapter 3.0: Comments and Responses.** This chapter contains reproductions of all comment letters received on the Recirculated Draft EIR. A written response for each CEQA-related comment received during the public review period is provided. Each response is keyed to the corresponding comment.

- **Chapter 4.0: Recirculated Draft EIR Text Revisions.** Corrections to the Recirculated Draft EIR that are necessary in light of the comments received and responses provided, or necessary to amplify or clarify material in the Recirculated Draft EIR, are contained in this chapter. Double underlined text represents language that has been added to the Recirculated Draft EIR; text with strikeout has been deleted from the Recirculated Draft EIR.

2.0 LIST OF COMMENTERS

This chapter presents a list of comment letters received during the public review period and describes the organization of the letters and comments provided in Chapter 3.0, Comments and Responses, of this document.

2.1 ORGANIZATION OF COMMENT LETTERS AND RESPONSES

Chapter 3.0 includes a reproduction of each comment letter received on the Recirculated Draft EIR. The written comments are grouped by the affiliation of the commenter, as follows: local agencies (A) and organizations and interested parties (B).

The comment letters are numbered consecutively following the A and B designations and follow the format below:

Local Agencies	A#-#
Organizations and Interested Parties	B#-#

The letters are numbered, and comments within each letter are numbered consecutively after the hyphen. For example, Letter A1 represents the first local agency letter, and Comment A1-1 represents the first enumerated comment within that letter.

2.2 LIST OF AGENCIES COMMENTING ON THE RECIRCULATED DRAFT EIR

Table 2.A provides a list of the State agencies, local agencies, and organizations and interested parties that commented on the Recirculated Draft EIR prior to the close of the public comment period. The comments received have been organized by date received and in a manner that facilitates finding a particular comment or set of comments. Each comment letter received is indexed with a number below.

Table 2.A: List of Comments Received

Local Agencies		
A1	Fresno Metropolitan Flood Control District, Gary Chapman	March 20, 2023
A2	Fresno County Airport Land Use Commission, staff	April 10, 2023
A3	Fresno Irrigation District, Laurence Kimura	May 17, 2023
A4	San Joaquin Valley Air Pollution Control District, Mark Montelongo	May 18, 2023
A5	City of Fresno Department of Public Utilities, Dejan Pavic	December 14, 2022, and March 29, 2023
Organizations and Interested Parties		
B1	Blum, Collins & Ho LLP, Gary Ho	May 15, 2023
B2	Advocates for the Environment, Dean Wallraf	May 17, 2023
B3	Adams Broadwell Joseph & Cardozo, Kevin Carmichael	May 19, 2023

This page intentionally left blank

3.0 COMMENTS AND RESPONSES

Written responses to each comment letter received on the Recirculated Draft EIR are provided in this chapter. All letters received during the public review period on the Recirculated Draft EIR are provided in their entirety. Each letter is immediately followed by responses keyed to the specific comments. The letters are grouped by the affiliation of the commenting entity as follows: local agencies (A) and organizations and interested parties (B).

Please note that to the extent text within individual letters has not been numbered, it indicates that the text does not raise substantive environmental issues or relate to the adequacy of the information or analysis within the Recirculated Draft EIR; therefore, no comment is enumerated, nor is a response required per CEQA Guidelines Sections 15088 and 15132. In addition, when general support or opposition is given for the project, that comment is noted but no further analysis is provided in the response, as the commenter is not questioning the adequacy of the information or analysis within the Recirculated Draft EIR. However, comments related to the merits of the proposed project will be considered by decision-makers taking action on the project.

Where comments on the Recirculated Draft EIR concern issues requiring technical expertise, the responses to comments, like the analysis in the Recirculated Draft EIR, rely on the knowledge and professional analysis of qualified experts.

Where revisions to the Recirculated Draft EIR text are called for, the page is set forth followed by the appropriate revision. Added text is indicated with double underlined text, and deleted text is shown in ~~strikeout~~. Text revisions to the Recirculated Draft EIR are summarized in Chapter 4.0 of this RTC Document.

Comment Letter A1

Fresno Metropolitan Flood Control District

Capturing Stormwater since 1956

File 170.251
210.412 "2021-02699"
310. "AS", "ZZ"
550.30

March 20, 2023

Mr. Steven Martinez, Planner
City of Fresno, Planning and Development Department
2600 Fresno Street, Room 3043
Fresno, CA 93721

Dear Mr. Martinez,

Fresno Metropolitan Flood Control District Comments for
Notice of Availability of a Draft Environmental Impact Report
2740 West Nielsen Avenue Office/Warehouse Project
Drainage Areas "AS" and "ZZ"

The District has reviewed the subject Notice of Availability (NOA) and finds that the District comments provided in the Notice of Requirements for DPA 2021-02699 dated November 17, 2021 are still applicable to this NOA. A copy of the Notice of Requirements for DPA 2021-02699 has been attached for your reference. **A1-1**

In addition, the District has the following comment:

- In Section 4.11 Utilities and Service Systems, Section 4.11.1.5 states that the project site is in FMFCD Drainage Area "AS". The project site is actually in two FMFCD Drainage Areas "AS" and "ZZ". The District requests that the NOA be revised to state the FMFCD Drainage Areas correctly. **A1-2**

The District will need to review and approve the final improvement plans for all development (i.e. grading, street improvement and storm drain) within the proposed project to insure consistency with the approved Storm Drainage Master Plan. **A1-3**

5469 E. Olive Avenue • Fresno, CA 93727 • (559) 456-3292 • FAX (559) 456-3194
www.fresnofloodcontrol.org

Comment Letter A1 Cont.

The drainage fee included on the attached Notice of Requirements was calculated in November of 2021. The District's drainage fee schedule was revised on March 8, 2023 and due to this revision, the current drainage fee for the proposed site is $700,335. A1-4

Thank you for the opportunity to comment. Please keep our office informed on the development of this project. If you should have any questions or comments, please contact the District at (559) 456-3292. A1-5

Sincerely,

Gary Chapman

Gary Chapman
Engineering Technician III

FRESNO, CA 93722

PROJECT NO: **2021-02699**
ADDRESS: **2740 W. NIELSEN AVE.**
APN: **458-020-72, 458-020-71**

SENT: **November 17, 2021**

Drainage Area(s)	Preliminary Fee(s)	Development Review Service Charge(s)	Fee(s)	
AS	$360,882.00	NOR Review	$1,675.00	To be paid prior to release of District comments to Public Agency and Developer.
ZZ	$191,951.00	Grading Plan Review	$8,519.00	Amount to be submitted with first grading plan submittal.
	Total Drainage Fee: $552,833.00		**Total Service Charge: $10,194.00**	

The proposed development will generate storm runoff which produces potentially significant environmental impacts and which must be properly discharged and mitigated pursuant to the California Environmental Quality Act and the National Environmental Policy Act. The District in cooperation with the City and County has developed and adopted the Storm Drainage and Flood Control Master Plan. Compliance with and implementation of this Master Plan by this development project will satisfy the drainage related CEQA/NEPA impact of the project mitigation requirements.

Pursuant to the District's Development Review Fee Policy, the subject project shall pay review fees for issuance of this Notice of Requirements (NOR) and any plan submittals requiring the District's reviews. The NOR fee shall be paid to the District by Developer before the Notice of Requirement will be submitted to the City. The Grading Plan fee shall be paid upon first submittal. The Storm Drain Plan fee shall be paid prior to return/pick up of first submittal.

The proposed development shall pay drainage fees pursuant to the Drainage Fee Ordinance prior to issuance of a building permit at the rates in effect at the time of such issuance. The fee indicated above is valid through 2/28/22 based on the site plan submitted to the District on 10/28/21 Contact FMFCD for a revised fee in cases where changes are made in the proposed site plan which materially alter the proposed impervious area.

Considerations which may affect the fee obligation(s) or the timing or form of fee payment:

a.) Fees related to undeveloped or phased portions of the project may be deferrable.

b.) Fees may be calculated based on the actual percentage of runoff if different than that typical for the zone district under which the development is being undertaken and if permanent provisions are made to assure that the site remains in that configuration.

c.) Master Plan storm drainage facilities may be constructed, or required to be constructed in lieu of paying fees.

d.) The actual cost incurred in constructing Master Plan drainage system facilities is credited against the drainage fee obligation.

e.) When the actual costs incurred in constructing Master Plan facilities exceeds the drainage fee obligation, reimbursement will be made for the excess costs from future fees collected by the District from other development.

f.) Any request for a drainage fee refund requires the entitlement cancellation and a written request addressed to the General Manager of the District within 60 days from payment of the fee. A non refundable $300 Administration fee or 5% of the refund whichever is less will be retained without fee credit.

FR DPA No. 2021-02699

Comment Letter A1 Attach.

FRESNO METROPOLITAN FLOOD CONTROL DISTRICT
NOTICE OF REQUIREMENTS

Approval of this development shall be conditioned upon compliance with these District Requirements.

1.

___ **a.** Drainage from the site shall

__X__ **b.** Grading and drainage patterns shall be as identified on Exhibit No. 1

___ **c.** The grading and drainage patterns shown on the site plan conform to the adopted Storm Drainage and Flood Control Master Plan.

2. The proposed development shall construct and/or dedicate Storm Drainage and Private On-Site facilities located within the development or necessitated by any off-site improvements required by the approving agency:

__X__ Developer shall construct facilities as shown on Exhibit No. 1 as PRIVATE ON-SITE SYSTEM TO BE CONSTRUCTED BY DEVELOPER.

___ None required.

3. The following final improvement plans and information shall be submitted to the District for review prior to final development approval:

__X__ Grading Plan

___ Street Plan

___ Storm Drain Plan

___ Water & Sewer Plan

___ Final Map

___ Drainage Report (to be submitted with tentative map)

___ Other

___ None Required

4. Availability of drainage facilities:

___ **a.** Permanent drainage service is available provided the developer can verify to the satisfaction of the City that runoff can be safely conveyed to the Master Plan inlet(s).

___ **b.** The construction of facilities required by Paragraph No. 2 hereof will provide permanent drainage service.

___ **c.** Permanent drainage service will not be available. The District recommends temporary facilities until permanent service is available.

__X__ **d.** See Exhibit No. 2.

5. The proposed development:

___ Appears to be located within a 100 year flood prone area as designated on the latest Flood Insurance Rate Maps available to the District, necessitating appropriate floodplain management action. (See attached Floodplain Policy.)

__X__ Does not appear to be located within a flood prone area.

6. ___ The subject site contains a portion of a canal or pipeline that is used to manage recharge, storm water, and/or flood flows. The existing capacity must be preserved as part of site development. Additionally, site development may not interfere with the ability to operate and maintain the canal or pipeline.

FR DPA No. 2021-02699

Comment Letter A1 Attach.

FRESNO METROPOLITAN FLOOD CONTROL DISTRICT
NOTICE OF REQUIREMENTS

7. The Federal Clean Water Act and the State General Permits for Storm Water Discharges Associated with Construction and Industrial Activities (State General Permits) require developers of construction projects disturbing one or more acres, and discharges associated with industrial activity not otherwise exempt from National Pollutant Discharge Elimination System (NPDES) permitting, to implement controls to reduce pollutants, prohibit the discharge of waters other than storm water to the municipal storm drain system, and meet water quality standards. These requirements apply both to pollutants generated during construction, and to those which may be generated by operations at the development after construction.

a. State General Permit for Storm Water Discharges Associated with Construction Activities, effective July 1, 2010, as amended. A State General Construction Permit is required for all clearing, grading, and disturbances to the ground that result in soil disturbance of at least one acre (or less than one acre) if part of a larger common plan of development or sale). Permittees are required to: submit a Notice of Intent and Permit Registration Documents to be covered and must pay a permit fee to the State Water Resources Control Board (State Board), develop and implement a storm water pollution prevention plan, eliminate non-storm water discharges, conduct routine site inspections, train employees in permit compliance, and complete an annual certification of compliance.

b. State General Permit for Storm Water Discharges Associated with Industrial Activities, April, 2014 (available at the District Office). A State General Industrial Permit is required for specific types of industries described in the NPDES regulations or by Standard Industrial Classification (SIC) code. The following categories of industries are generally required to secure an industrial permit: manufacturing; trucking; recycling; and waste and hazardous waste management. Specific exemptions exist for manufacturing activities which occur entirely indoors. Permittees are required to: submit a Notice of Intent to be covered and must pay a permit fee to the State Water Resources Control Board, develop and implement a storm water pollution prevention plan, eliminate non-storm water discharges, conduct routine site inspections, train employees in permit compliance, sample storm water runoff and test it for pollutant indicators, and annually submit a report to the State Board.

c. The proposed development is encouraged to select and implement storm water quality controls recommended in the Fresno-Clovis Storm Water Quality Management Construction and Post-Construction Guidelines (available at the District Office) to meet the requirements of the State General Permits, eliminate the potential for non-storm water to enter the municipal storm drain system, and where possible minimize contact with materials which may contaminate storm water runoff.

8. A requirement of the District may be appealed by filing a written notice of appeal with the Secretary of the District within ten days of the date of this Notice of Requirements.

9. The District reserves the right to modify, reduce or add to these requirements, or revise fees, as necessary to accommodate changes made in the proposed development by the developer or requirements made by other agencies.

10. **X** See Exhibit No. 2 for additional comments, recommendations and requirements.

OTHER REQUIREMENTS

EXHIBIT NO. 2

DPA 2021-02699 is located in two drainage areas, Drainage Area "AS" and Drainage Area "ZZ". Development of the site shall maintain the Master Plan area to each drainage area as shown on Exhibit No. 1.

The minimum finish floor elevation of the development shall be one foot higher than the controlling flood safety overflow point. The controlling flood safety overflow point for the portion of the project located in Drainage Area "ZZ" is the bridge on Hughes Avenue over the Houghton Canal. The controlling flood safety overflow point for the portion of the project located in Drainage Area "AS" is the breakover to the Houghton Canal on the west side of Marks Avenue between Nielsen Avenue and the Union Pacific Railroad. The elevations at the mentioned breakover locations will need to be provided on the grading plans for review and verification of proposed building finish floor elevations for the development.

The construction of the "Private On-Site System" shown on Exhibit No. 1 will provide permanent drainage service to the portion of the project located in Drainage Area "ZZ". Permanent drainage service will not be available for the portion of the project located in Drainage Area "AS". The District recommends temporary facilities until permanent service is available.

In an effort to improve storm runoff quality, outdoor storage areas shall be constructed and maintained such that material that may generate contaminants will be prevented from contact with rainfall and runoff and thereby prevent the conveyance of contaminants in runoff into the storm drain system.

The District encourages, but does not require that roof drains from non-residential development be constructed such that they are directed onto and through a landscaped grassy swale area to filter out pollutants from roof runoff.

Runoff from areas where industrial activities, product, or merchandise come into contact with and may contaminate storm water must be treated before discharging it off-site or into a storm drain. Roofs covering such areas are recommended. Cleaning of such areas by sweeping instead of washing is to be required unless such wash water can be directed to the sanitary sewer system. Storm drains receiving untreated runoff from such areas shall not be connected to the District's system. Loading docks, depressed areas, and areas servicing or fueling vehicles are specifically subject to these requirements. The District's policy governing said industrial site NPDES program requirements is available on the District's website at: www.fresnofloodcontrol.org or contact the District's Environmental Department for further information regarding these policies related to industrial site requirements.

LETTER A1
Fresno Metropolitan Flood Control District
Gary Chapman, Engineering Technician III
March 20, 2023

Response A1-1: This introductory comment is noted. Comments provided in this letter are further responded to below.

Response A1-2: This comment states Section 4.11.1.5 states that the project site is in Fresno Metropolitan Flood Control District (FMFCD) Drainage Area "AS." The project site is actually in two FMFCD Drainage Areas, "AS" and "ZZ." The District requests that the NOA be revised to state the FMFCD Drainage Areas correctly. Therefore, in response to this comment, and as shown in Chapter 4.0 of this RTC Document, text on page 4.11-5 has been revised as follows:

> The FMFCD drainage area for stormwater from the project site is ~~b~~Basin Drainage Areas "AS" and "ZZ"~~, located southwest from the site~~.

This comment does not address the adequacy or completeness of the Recirculated Draft EIR; does not raise environmental issues; and does not request the incorporation of additional information relevant to environmental issues. As such, additional analysis is not required.

Response A1-3: This comment states that the FMFCD will need to review and approve the final improvement plans for all development (i.e., grading, street improvement and storm drain) within the proposed project to ensure consistency with the approved Storm Drainage Master Plan. This comment is noted but does not pertain to the Recirculated Draft EIR.

Response A1-4: This comment states that the FMFCD's drainage fee schedule was revised on March 8, 2023, and the current drainage fee for the proposed site is $700,335. This comment is noted but does not pertain to the analysis or conclusions of the Recirculated Draft EIR; therefore, no further analysis is required.

Response A1-5: This comment provides a closing to the comment letter and does not question the adequacy of the analysis included in the Recirculated Draft EIR. No further response is required.

Comment Letter A2

April 10, 2023

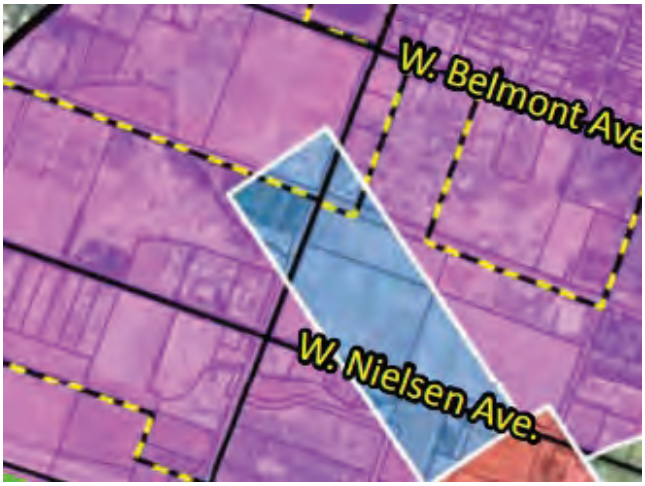
Fresno County Airport Land Use Commission staff review of Scannell Properties Office/Warehouse Project (Development Permit Application No. P21-02699 and Tentative Parcel Map No. P21-05930)

Recirculated Draft Environmental Impact Report (EIR) review and response to the following:

Property location: 2740 West Nielsen Avenue, Fresno CA

- Does not sit within airport noise contours.
- The majority of the property sits within Safety Zone 4, Outer Approach/Departure Zone, and a portion (purple) in Safety Zone 6, Traffic Pattern Zone of Fresno Chandler Executive Airport. It also sits within the Vulnerable Occupants Review Area (VORA). Vulnerable occupants include children, the elderly, and people with disabilities.

A2-1



Threshold 4.7.5 on page 2-14 of the EIR states the following project would be located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport and would not result in a safety hazard for people residing or working in the project area. However, ALUC staff would like to draw attention to the following aspects:

A2-2

1. With 385 carpool spaces dedicated for standard vehicles, and 11 spaces dedicated for accessible standard vehicles, it is likely the parcel inhabitants would exceed the maximum non-residential intensity of both zones 4 and 6.

A2-3

2. Section 4.1.1.6, Light Sources and Glare on page 4.1-3 addresses accommodations for the urbanized, adjacent, residential areas. Mitigation Measures AES-1-5 should also take into account requirements for assuring glare However, potential Hazards to Flight include physical (e.g., tall objects), visual, and electronic forms of interference with the safety of aircraft operations. Therefore, steps should be taken to hood all sources of outdoor lighting within Airport Safety Zones 4 and 6.

A2-4

3. Threshold 4.9.3 on page 2-16 of the EIR document states that for a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, the proposed project would

A2-5

Comment Letter A2 Cont.

not expose people residing or working in the project area to excessive noise levels. More importantly, this project does not sit within the airport noise contours of Fresno-Chandler Downtown Airport and is therefore not a noise concern for the ALUC. A2-5 cont.

4. Figure 3-5, 2740 West Nielson Office/Warehouse Project Site Plan does not address the 10-20% open land requirement of the airport safety zones. A2-6

Fresno County ALUCP Safety Zone 4, Outer Approach/Departure Zone Safety requirements:

- 1 d.u. per 2 acres
- 150 persons per acre - usage intensity calculations shall include the maximum number of people (e.g., employees, customers/visitors, etc.) who may be on the parcels or site at a single point in time, whether indoors or outside.
- 20% Open Land. Open land requirements are intended to be applied with respect to an entire zone. This is typically accomplished as part of a community general plan or a specific plan but may also apply to large (10 acres or more) development projects.

Prohibited uses:

- Children's schools, day care centers
- libraries, hospitals, nursing homes
- hazardous uses (e.g., aboveground bulk fuel storage or gas stations)
- Bldgs. with >3 aboveground habitable floors
- Highly noise-sensitive outdoor non-residential uses
- Hazards to flight - include physical (e.g., tall objects), visual, and electronic forms of interference with the safety of aircraft operations

Other Development conditions:

- Airport disclosure notice required
- Airspace review required for objects >70 feet tall. This height criterion is for general guidance. Shorter objects normally will not be airspace obstructions unless situated at a ground elevation well above that of the airport (See examples 1, 2, & 3 on Exhibit 3A). Taller objects may be acceptable if determined not to be obstructions. Developers proposing structures that could penetrate 14 CFR Part 77 surfaces must file Form 7460 with the FAA to determine if 7460 review is required, consult FAA's Notice Criteria Tool: https://oeaaa.faa.gov/oeaaa/external/gisTools/gisAction.jsp?action=showNoNoticeRequiredToolForm

Fresno County ALUCP Safety Zone 6, Traffic Pattern Zone Safety requirements:

- No Limit on dwelling units per acres
- Maximum Non-residential Intensity: 300 persons per acre - usage intensity calculations shall include the maximum number of people (e.g., employees, customers/visitors, etc.) who may be on the parcels or site at a single point in time, whether indoors or outside
- Required Open Land. 10% Open land requirements are intended to be applied with respect to an entire zone. This is typically accomplished as part of a community general plan or a specific plan, but may also apply to large (10 acres or more) development projects.

Prohibited Uses:

- Hazards to flight - include physical (e.g., tall objects), visual, and electronic forms of interference with the safety of aircraft operations
- Outdoor stadiums and similar uses with very high intensity uses

Comment Letter
A2
Attach.

Other Development Conditions:

- Airport disclosure notice required
- Airspace review required for objects >100 feet tall. This height criterion is for general guidance. Shorter objects normally will not be airspace obstructions unless situated at a ground elevation well above that of the airport (See examples 1, 2, & 3 on Exhibit 3A). Taller objects may be acceptable if determined not to be obstructions. Developers proposing structures that could penetrate 14 CFR Part 77 surfaces must file Form 7460 with the FAA to determine if 7460 review is required, consult FAA's Notice Criteria Tool: https://oeaaa.faa.gov/oeaaa/external/gisTools/gisAction.jsp?action=showNoNoticeRequiredToolForm
- New structures are prohibited on existing terrain that penetrates 14 CFR Part 77 surfaces
- New structures require additional airspace analysis required within the 50-foot terrain penetration buffer
- Proposed uses whose primary purpose is to serve vulnerable occupants within 3,000 feet from the side of the runway and 5,000 feet from the end of the runway shall require ALUC review. In addition to the prohibited uses listed within Table 3A of the ALUCP, any use whose primary purpose is to serve vulnerable occupants in the area described above is strongly discouraged.

LETTER A2
Fresno County Airport Land Use Commission
Staff Review
April 10, 2023

Response A2-1: This comment is introductory. It states that the project site does not sit within airport noise contours and that the majority of the property sits within Safety Zone 4, Outer Approach/Departure Zone, with a portion in Safety Zone 6, Traffic Pattern Zone of Fresno Chandler Executive Airport. This comment is noted but does not pertain to the analysis or conclusions of the Recirculated Draft EIR; therefore, no further analysis is required.

Response A2-2: This comment is noted. Staff comments provided in this letter are further responded to below.

Response A2-3: This comment states that with 385 carpool spaces dedicated for standard vehicles, and 11 spaces dedicated for accessible standard vehicles, it is likely that the parcel inhabitants would exceed the maximum non-residential intensity of both zones 4 and 6.

As discussed in Section 3.3.1, Access, Circulation, and Parking of the Recirculated Draft EIR, a total of 594 on-site parking spaces would be provided for vehicles and trucks. Of the 594 parking spaces, 385 spaces would be dedicated for standard vehicles, 11 spaces would be dedicated for accessible standard vehicles, and 10 spaces would be dedicated for accessible vans. The proposed project would not provide 385 carpool spaces.

In addition, based on the Fresno County Airport Land Use Compatibility Plan (ALUCP) safety requirements, in zone 4, the maximum non-residential intensity is 150 persons per acre and in zone 6, the maximum non-residential intensity is 300 persons per acre. As identified in Chapter 3.0, Project Description, of the Recirculated Draft EIR, the project site is 48.03 acres. Therefore, the maximum non-residential intensity would be between 7,204 and 14,409 persons. As discussed in the Recirculated Draft EIR, the proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. At this time, the specific number of employees is not yet known. However, the Traffic Impact Study (TIS) (Appendix M of the Recirculated Draft EIR) assumed that the proposed project would have approximately 4,920 employees, which was calculated based on a building-square-footage-to-employee conversion factor in the Institute of Transportation Engineers (ITE) Trip Generation Manual, 10th Edition. As such, it is not expected that the proposed project would generate 7,204 or more employees. Therefore, the proposed project would not exceed the maximum non-residential intensity of zones 4 and 6.

Response A2-4: This comment states that Section 4.1.1.6, Light Sources and Glare, on page 4.1-3 addresses accommodations for the urbanized, adjacent, and residential areas. This comment also states that Mitigation Measures AES-1 through AES-5 should also take into account requirements for ensuring minimization of glare. In addition, this comment states that potential hazards to flight include physical (e.g., tall objects), visual, and electronic forms of interference with the safety of aircraft operations. Therefore, steps should be taken to hood all sources of outdoor lighting within Airport Safety Zones 4 and 6.

As discussed on pages 4.1-7 and 4.1-8 of the Recirculated Draft EIR, implementation of the proposed project would result in an increase of nighttime lighting levels over current levels in the project area, associated with parking lot lights and security-related lighting in the project site. Compliance with California Building Code (Title 24, California Code of Regulations [CCR]) standards would minimize the proposed project's light and glare impacts. Additionally, all exterior lighting at the project site would be pointed downward toward the project site to minimize lighting levels at nearby uses. In addition, the proposed project would be required to comply with Article 25, Performance Standards, of the Zoning Ordinance, which includes standards related to lighting and glare. Further, Mitigation Measures AES-1 through AES-3 would ensure that the proposed project's lighting systems do not create a substantial new source of light by requiring shielding mechanisms to direct light away from nearby uses. As a result, any new sources of light resulting from the proposed project would not be substantial in the context of existing lighting sources. Implementation of Mitigation Measure AES-4 would ensure that the proposed project's lighting systems do not create a substantial new source of light by imposing a cap on the intensity of lighting systems based on the average intensity of the surrounding streets.

Additionally, while the project does not propose use of highly reflective glass elements or building materials, Mitigation Measure AES-5 requires materials used on building façades to be non-reflective. Therefore, any new source of glare would not be substantial.

With implementation of Mitigation Measures AES-1 through AES-5, lighting systems would include shields to direct light downward and materials uses on building facades shall be non-reflective. As such, with the implementation of these measures, all outdoor lighting would be shielded consistent with requirements for airplane safety and minimization of hazards to flight.

Response A2-5: This comment states that Threshold 4.9.3 of the Recirculated Draft EIR states that for a project located within the vicinity of a private airstrip or an airport land use plan, or where such a plan has not been adopted, within 2 miles of a public airport or public use airport, the proposed project would not expose people residing or working in the project area to excessive noise levels. More importantly, this project does not sit within the airport noise contours of

Fresno-Chandler Downtown Airport and is therefore not a noise concern for the Airport Land Use Commission (ALUC). This comment is noted.

Response A2-6: This comment states that Figure 3-5, Site Plan, of the Recirculated Draft EIR does not address the 10–20 percent open land requirement of the airport safety zones. As discussed in Section 3.3.2, Open Space and Landscaping, of the Recirculated Draft EIR, consistent with City requirements, landscaping would be provided throughout the project site. The project would also include a vegetative plan that includes the planting of trees and other landscaping materials throughout the perimeter of the project site that would be consistent with the 10–20 percent open land requirement of the airport safety zones.

RE: Notice of Availability of a Recirculated Draft Environmental Impact Report for the 2740 West Nielsen Avenue Office/Warehouse Project

Dear Mr. Martinez:

The Fresno Irrigation District (FID) has reviewed the Notice of Preparation of a Program Environmental Impact Report, an Update to the Master Environmental Impact Report for the City of Fresno General Plan (Project), APNs: 458-020-71, 72. We appreciate the opportunity to review and comment on the subject documents for the proposed project. FID's comments are as follows: **A3-1**

1. FID previously reviewed and commented on the subject property on September 28, 2022, as Notice of Preparation of a Program Environmental Impact Report for the 2740 West Nielsen Avenue Office/Warehouse Project, on November 22, 2021, as Planning Application No. P21-02699, and on March 3, 2022, as Tentative Parcel Map Application No. P21-05930. Those comments and conditions still apply copies have been attached for your reference. **A3-2**

Thank you for making available to us the Notice of Availability of a Recirculated Environmental Impact Report for the 2740 West Nielsen Avenue Office/Warehouse Project for our review and allowing us the opportunity to provide comments. We appreciate the opportunity to review and comment on the subject documents for this project. If you have any questions, please feel free to contact me Jeremy Landrith at (559) 233-7161 extension 7407 or jlandrith@fresnoirrigation.com. **A3-3**

Sincerely,

Laurence Kimura, P.E.
Chief Engineer

NOTICE OF AVAILABILITY OF A RECIRCULATED DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE 2740 WEST NIELSEN AVENUE OFFICE/WAREHOUSE PROJECT

Date: April 4, 2023

To: State Clearinghouse, Responsible Agencies, Interested Parties and Organizations

Subject: Notice of Availability of a Recirculated Draft Environmental Impact Report for the 2740 West Nielsen Avenue Office/Warehouse Project in Fresno, CA

Lead Agency:
City of Fresno
Planning and Development Department
2600 Fresno Street, Room 3043
Fresno, CA 93721
(559) 621-8277
Planning@fresno.gov

Contact:
Steven Martinez
Planner
City of Fresno – Planning and Development Department
2600 Fresno Street, Room 3043
Fresno, CA 93721
(559) 621-8047
Steven.Martinez@fresno.gov

Comment Period: April 4, 2023 to May 19, 2023

Notice is hereby given that the City of Fresno (City) is the Lead Agency on the below-described 2740 West Nielsen Avenue Office/Warehouse Project (proposed project) and has completed a Recirculated Draft Environmental Impact Report (EIR), pursuant to the California Environmental Quality Act (CEQA).

Project Title: 2740 West Nielsen Avenue Office/Warehouse Project (Development Permit Application No. P21-02699 and Tentative Parcel Map Application No. P21-05930) (State Clearinghouse No. 2022050265)

Project Location: The proposed project is located on approximately 48.03 acres at 2740 West Nielsen Avenue: Northeast of intersection of North Marks Avenue and West Nielsen Avenue in Fresno, California (Assessor's Parcel Numbers [APNs]: 458-020-71 and 458-020-72). The project site is bounded to the north by vacant, undeveloped land, to the east by North Hughes Avenue, to the south by West Nielsen Avenue, and to the west by North Marks Avenue.

Project Description: The proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. The proposed buildings would result in a total gross floor area of

approximately 901,438 square feet. The buildings' exterior would be up to 44 feet high with an interior height of up to 36 feet and designed with a total of 201 loading dock doors on the north and south sides of the buildings. The four buildings would be comprised of the following: Building 1 would be 468,812 square feet and would provide 122 loading dock doors; Building 2 would be 248,786 square feet and would provide 46 loading dock doors; Building 3 would be 93,074 square feet and would provide 18 loading dock doors; and Building 4 would be 90,766 square feet and would provide 15 loading dock doors.

A total of 594 on-site parking spaces would be provided for vehicles and trucks. Of the 594 parking spaces, 385 spaces would be dedicated for standard vehicles, 11 spaces would be dedicated for accessible standard vehicles, and 10 spaces would be dedicated for accessible vans. The remaining 188 spaces would be dedicated for trailers and would be located along the eastern and western edges of the project site and would be located behind two 8-foot-tall gates, which would be installed to separate the general parking area from the truck storage and dock loading area.

Recirculated Draft EIR: A Draft EIR was previously circulated from February 24, 2023 with an end date of April 10, 2023. As per State CEQA Guidelines Section 15088.5, a lead agency is required to recirculate an EIR when significant new information is added to the EIR, or when recirculation occurs after giving public notice of the availability of the Draft EIR for public review and before certification of the EIR. The Recirculated Draft EIR includes Chapter 6.0, CEQA-Required Assessment Conclusions, and Chapter 7.0, Report Preparation. In compliance with the California Public Resources Code (PRC) Section 21092.1 and State CEQA Guidelines Section 15088.5, the City has prepared this Recirculated Draft EIR to include Chapters 6.0 and 7.0 that were previously omitted from the Draft EIR.

Anticipated Significant Environmental Effects: The Draft EIR (February 2023) identifies potential significant effects in the following areas:

- Aesthetics
- Air Quality
- Biological Resources
- Cultural Resources
- Hazards and Hazardous Materials
- Noise
- Tribal Cultural Resources

Mitigation measures identified in the Draft EIR would reduce potentially significant effects to less-than-significant levels in all areas. The project site is not contaminated and is not identified as cleanup site as defined by Government Code Section 65962.5.

Public Review Period: The City is circulating the Recirculated Draft EIR for public review and comment for a period of 45 days (April 4, 2023 to May 19, 2023), which is consistent with Section 15105(a) of the State CEQA Guidelines. As described further in Section 15088.5(f) of the State CEQA Guidelines, recirculating an EIR can result in the lead agency receiving more than one set of comments from reviewers. The lead agency may identify the set of comments to which it will respond by: (1) requiring reviewers to submit new comments when an EIR is substantially revised and the entire document is recirculated; or (2) requesting that reviewers limit their comments to only the revised chapter or portions of the Recirculated EIR. In no case shall the lead agency fail to respond to pertinent comments on significant environmental issues.

In this case, the revised portions of the Draft EIR include Chapter 6.0, CEQA-Required Assessment Conclusions, and Chapter 7.0, Report Preparation, and the City will accept and respond to all comments on all chapters received between February 24, 2023 through May 19, 2023.

All documents related to this project are available for public review during normal business hours (Monday - Friday, 8:00 A.M. – 5:00 P.M.) by appointment only, at the Planning and Development Department at 2600 Fresno Street, Room 3043, Fresno, CA 93721. Electronic copies may also be requested for review. In addition, some references used in the Draft EIR are physical copies and/or copyright protected and are only available in person at the Planning and Development Department. Please contact Steven Martinez via e-mail or by phone to request electronic copies or to schedule an appointment to view documents. Documents related to this project can also be accessed on the City's website at: https://www.fresno.gov/darm/planning-development/plans-projects-under-review.

Written comments concerning the Draft EIR are due by 5:00 P.M. on May 19, 2023 and should be submitted to Steven Martinez (contact information provided above).

RE: Notice of Preparation of a Program Environmental Impact Report for the 2740 West Nielsen Avenue Office/Warehouse Project

Dear Mr. Martinez:

The Fresno Irrigation District (FID) has reviewed the Notice of Preparation of a Program Environmental Impact Report, an Update to the Master Environmental Impact Report for the City of Fresno General Plan (Project), APNs: 458-020-71, 72. We appreciate the opportunity to review and comment on the subject documents for the proposed project. FID's comments are as follows:

1. FID previously reviewed and commented on the subject property on November 22, 2021, as Planning Application No. P21-02699 and on March 3, 2022, as Tentative Parcel Map Application No. P21-05930. Those comments and conditions still apply copies have been attached for your reference.

Thank you for making available to us the Notice of Preparation of a Program Environmental Impact Report for our review and allowing us the opportunity to provide comments. We appreciate the opportunity to review and comment on the subject documents for this project. If you have any questions, please feel free to contact me Chris Lundeen at (559) 233-7161 extension 7410 or clundeen@fresnoirrigation.com.

Sincerely,

Laurence Kimura, P.E.
Chief Engineer

RE: Planning Application No. P21-02699
N/E Marks and Nielsen avenues

Dear Mr. Young:

The Fresno Irrigation District (FID) has reviewed the Planning Application No. P21-02699 for which the applicant proposes the construction of four (4) Industrial Warehouse Buildings, APN's: 458-020-71 and 72. FID has the following comments:

1. FID does not own, operate, or maintain any facilities located on the subject property, as shown on the attached FID exhibit map.

2. For informational purposes, FID's active Houghton No. 78 runs westerly along the north side of Nielsen Avenue, crosses Nielsen Avenue approximately 2,470 feet east of the subject property, continues west along the south side of Nielsen Avenue, crosses Hughes Avenue approximately 1,280 feet east of the subject property, crossing Marks Avenue approximately 300 feet south of the subject property, crossing Nielsen Avenue approximately 190 feet west of subject property and continues northwest along the west side of Marks Avenue as shown on the attached FID exhibit map. Should this project include any street and/or utility improvements along Nielsen Avenue, Hughes Avenue, Marks Avenue, or in the vicinity of this facility, FID requires it review and approve all plans.

3. For informational purposes, FID's active Cole – S. Br. No. 40 runs southwesterly, crosses Marks Avenue approximately 300 feet north of the subject property and continues south along the west side of Marks Avenue, as shown on the attached FID exhibit map. Should this project include any street and/or utility improvements along Marks Avenue or in the vicinity of this facility, FID requires it review and approve all plans.

BOARD OF DIRECTORS President RYAN JACOBSEN Vice-President JERRY PRIETO, JR. CHRISTOPHER WOOLF
GEORGE PORTER GREGORY BEBERIAN General Manager BILL STRETCH

Comment Letter
A3
Attach.

4. For informational purposes, FID's active Teilman No. 79 runs southerly along the west side of Marks Avenue and crosses Whitesbridge Avenue approximately 2,560 feet south of the subject property, as shown on the attached FID exhibit map.

Thank you for submitting this for our review. We appreciate the opportunity to review and comment on the subject documents for the proposed project. If you have any questions, please feel free to contact Jeremy Landrith at (559) 233-7161 extension 7407 or jlandrith@fresnoirrigation.com.

RE: Tentative Parcel Map Application No. P21-05930
N/E Nielsen and Marks avenues

Dear Mr. Lara:

The Fresno Irrigation District (FID) has reviewed the Tentative Parcel Map No. 2022-01, Planning Application P22-00102 for which the applicant proposes to subdivide a residential property into two lots, APN: 443-214-10. FID has the following comments:

1. FID previously reviewed and commented on the subject property on December 16, 2020, as Development Review Committee Application P20-04688 and on November 22, 2021, as Development Permit Application No. P21-02699. Those comments and conditions still apply and a copy has been attached for your review.

Thank you for submitting this for our review. We appreciate the opportunity to review and comment on the subject documents for the proposed project. If you have any questions, please feel free to contact Jeremy Landrith at (559) 233-7161 extension 7407 or jlandrith@fresnoirrigation.com.

VESTING TENTATIVE PARCEL MAP NO. 2021-09

LEGAL DESCRIPTION:

The Land referred to herein below is situated in the City of Fresno, County of Fresno, State of California, and is described as follows:

PARCEL 1:

PARCEL C AS SHOWN ON LOT LINE ADJUSTMENT NO. 2013-06, AS EVIDENCED BY DOCUMENT RECORDED JUNE 11, 2013 AS INSTRUMENT NO. 2013-0082690 OF OFFICIAL RECORDS OF FRESNO COUNTY, AND MORE PARTICULARLY DESCRIBED AS FOLLOWS:

THAT PORTION OF VOLUNTARY PARCEL MERGER NO. 2013-03, AS DOCUMENT NO. 2013-0082689, OF OFFICIAL RECORDS OF FRESNO COUNTY, DESCRIBED AS FOLLOWS:

THAT PORTION OF LOTS 20 TO 29, INCLUSIVE, OF WEST FRESNO, IN THE CITY OF FRESNO, COUNTY OF FRESNO, STATE OF CALIFORNIA, ACCORDING TO THE MAP THEREOF RECORDED IN VOLUME 2 OF PLATS, PAGE 50, LYING SOUTH OF A LINE THAT IS PARALLEL WITH AND 358.71 FEET SOUTH OF THE SOUTH LINE OF THAT CERTAIN STRIP OF LAND 100 FEET WIDE GRANTED TO THE SOUTHERN PACIFIC RAILROAD COMPANY BY DEED DATED MAY 13, 1982 RECORDED IN BOOK 145, PAGE 399 OF DEEDS, AND WEST OF A LINE THAT IS PARALLEL WITH AND 1169.00 FEET EAST OF THE WEST LINE OF SAID LOTS 24 AND 25.

EXCEPTING THEREFROM THAT PORTION THEREOF GRANTED TO FRESNO IRRIGATION DISTRICT BY AGREEMENT DATED OCTOBER 1, 1945 RECORDED FEBRUARY 14, 1947 IN BOOK 2494 PAGE 185 OF OFFICIAL RECORDS.

PARCEL 2:

PARCEL D AS SHOWN ON LOT LINE ADJUSTMENT NO. 2013-06, AS EVIDENCED BY DOCUMENT RECORDED JUNE 11, 2013 AS INSTRUMENT NO. 2013-0082690 OF OFFICIAL RECORDS OF FRESNO COUNTY, AND MORE PARTICULARLY DESCRIBED AS FOLLOWS:

THAT PORTION OF VOLUNTARY PARCEL MERGER NO. 2013-03, AS DOCUMENT NO. 2013-0082689 OF OFFICIAL RECORDS OF FRESNO COUNTY, AND LOTS 17 TO 19 OF WEST FRESNO, IN THE CITY OF FRESNO, COUNTY OF FRESNO, STATE OF CALIFORNIA, ACCORDING TO THE MAP THEREOF RECORDED IN VOLUME 2 OF PLATS, PAGE 50, FRESNO COUNTY RECORDS, DESCRIBED AS FOLLOWS:

THAT PORTION OF LOTS 17 TO 32, INCLUSIVE, OF SAID WEST FRESNO LYING SOUTH OF A LINE THAT IS PARALLEL WITH AND 358.71 FEET SOUTH OF THE SOUTH LINE OF THAT CERTAIN STRIP OF LAND 100 FEET WIDE GRANTED TO THE SOUTHERN PACIFIC RAILROAD COMPANY BY DEED DATED MAY 13, 1982 RECORDED IN BOOK 145, PAGE 399 OF DEEDS, AND EAST OF A LINE THAT IS PARALLEL WITH AND 1169.00 FEET EAST OF THE WEST LINE OF SAID LOTS 24 AND 25.

For conveyancing purposes only: APN 458-020-71 (Affects Parcel 1) 458-020-72 (Affects Parcel 2)

FLOOD ZONE INFORMATION:

This property lies in Zone "X" as shown on Federal Emergency Management Agency (FEMA) City of Fresno and Incorporated Areas, California, Map No. 06019C2135H Map Revised: February 18, 2009.

Flood Zone "X" is described as "Area with Minimal Flood Risk" and further described as "0.2% Annual Chance Flood Hazard, Areas of 1% annual chance flood with average depth less than one foot or with drainage areas of less than one square mile."

RE: Planning Application No. P21-02699
N/E Marks and Nielsen avenues

Dear Mr. Young:

The Fresno Irrigation District (FID) has reviewed the Planning Application No. P21-02699 for which the applicant proposes the construction of four (4) Industrial Warehouse Buildings, APN's: 458-020-71 and 72. FID has the following comments:

1. FID does not own, operate, or maintain any facilities located on the subject property, as shown on the attached FID exhibit map.

2. For informational purposes, FID's active Houghton No. 78 runs westerly along the north side of Nielsen Avenue, crosses Nielsen Avenue approximately 2,470 feet east of the subject property, continues west along the south side of Nielsen Avenue, crosses Hughes Avenue approximately 1,280 feet east of the subject property, crossing Marks Avenue approximately 300 feet south of the subject property, crossing Nielsen Avenue approximately 190 feet west of subject property and continues northwest along the west side of Marks Avenue as shown on the attached FID exhibit map. Should this project include any street and/or utility improvements along Nielsen Avenue, Hughes Avenue, Marks Avenue, or in the vicinity of this facility, FID requires it review and approve all plans.

3. For informational purposes, FID's active Cole – S. Br. No. 40 runs southwesterly, crosses Marks Avenue approximately 300 feet north of the subject property and continues south along the west side of Marks Avenue, as shown on the attached FID exhibit map. Should this project include any street and/or utility improvements along Marks Avenue or in the vicinity of this facility, FID requires it review and approve all plans.

BOARD OF DIRECTORS President RYAN JACOBSEN Vice-President JERRY PRIETO, JR. CHRISTOPHER WOOLF
GEORGE PORTER GREGORY BEBERIAN General Manager BILL STRETCH

Comment Letter
A3

4. For informational purposes, FID's active Teilman No. 79 runs southerly along the west side of Marks Avenue and crosses Whitesbridge Avenue approximately 2,560 feet south of the subject property, as shown on the attached FID exhibit map.

Thank you for submitting this for our review. We appreciate the opportunity to review and comment on the subject documents for the proposed project. If you have any questions, please feel free to contact Jeremy Landrith at (559) 233-7161 extension 7407 or jlandrith@fresnoirrigation.com.

Sincerely,

Laurence Kimura, P.E.

RE: Planning Application No. P20-04688
N/E Marks and Nielsen avenues

Dear Ms. Mariboho:

The Fresno Irrigation District (FID) has reviewed the Planning Application No. P20-04688 for which the applicant proposes the construction of three (3) office/warehouse buildings, APN: 458-020-71. FID has the following comments:

1. FID does not own, operate, or maintain any facilities located on the subject property, as shown on the attached FID exhibit map.

2. For informational purposes, FID's active Houghton No. 78 runs westerly along the north side of Nielsen Avenue, crosses Nielsen Avenue approximately 2,470 feet east of the subject property, continues west along the south side of Nielsen Avenue, crossing Hughes Avenue approximately 1,280 feet east of the subject property, crossing Marks Avenue approximately 300 feet south of the subject property, crossing Nielsen Avenue approximately 190 feet west of subject property and continues northwest along the west side of Marks Avenue as shown on the attached FID exhibit map. Should this project include any street and/or utility improvements along Nielsen Avenue, Hughes Avenue, Marks Avenue, or in the vicinity of this facility, FID requires it review and approve all plans.

3. For informational purposes, FID's active Cole – S. Br. No. 40 runs southwesterly, crosses Marks Avenue approximately 380 feet north of the subject property and continues south along the west side of Marks Avenue, as shown on the attached FID exhibit map. Should this project include any street and/or utility improvements along Marks Avenue or in the vicinity of this facility, FID requires it review and approve all plans.

Fresno, CA 93721
(559) 621-8047
Steven.Martinez@fresno.go

Comment Period: September 9, 2022 to October 10, 2022

Si necesita información en Español, comuníquese con Juan Lara al teléfono (559) 621-8075 o por correo electrónico a Juan.Lara@fresno.gov.

Notice is Hereby Given: The City of Fresno (City) is the Lead Agency on the below-described 2740 West Nielsen Avenue Office/Warehouse Project (proposed project) and has prepared a Notice of Preparation (NOP) of an Environmental Impact Report (EIR), pursuant to the California Environmental Quality Act (CEQA). The NOP is intended to solicit the views of the public, interested parties, and/or agencies as to the scope and content of the environmental information which is relevant to you or your agency's statutory responsibilities in connection with the proposed project. Specifically, the City is requesting that commenters identify environmental topics (and/or special studies) that they believe need to be explored in the forthcoming EIR, and to identify other relevant environmental issues related to the scope and content of the forthcoming EIR.

Project Title: 2740 West Nielsen Avenue Office/Warehouse Project (Development Permit Application No. P21-02699 and Tentative Parcel Map No. P21-05930) (State Clearinghouse No. 2022050265)

Project Location: The proposed project is located on approximately 48.03 acres at 2740 West Nielsen Avenue: Northeast of intersection of North Marks Avenue and West Nielsen Avenue in

Fresno, California (Assessor's Parcel Numbers [APNs]: 458-020-71 and 458-020-72). The project site is bounded to the north by vacant, undeveloped land, to the east by North Hughes Avenue, to the south by West Nielsen Avenue, and to the west by North Marks Avenue. The attached Figure 1 shows the regional and local context of the project location.

Project Description: The proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. The proposed buildings would result in a total gross floor area of approximately 901,438 square feet. The buildings' exterior would be up to 44 feet high with an interior height of up to 36 feet and designed with a total of 201 loading dock doors on the north and south sides of the buildings. The four buildings would be comprised of the following: Building 1 would be 468,812 square feet and would provide 122 loading dock doors; Building 2 would be 248,786 square feet and would provide 46 loading dock doors; Building 3 would be 93,074 square feet and would provide 18 loading dock doors; and Building 4 would be 90,766 square feet and would provide 15 loading dock doors. Figure 2 shows the project site plan.

A total of 594 on-site parking spaces would be provided for vehicles and trucks. Of the 594 parking spaces, 385 spaces would be dedicated for standard vehicles, 11 spaces would be dedicated for accessible standard vehicles, and 10 spaces would be dedicated for accessible vans. The remaining 188 spaces would be dedicated for trailers and would be located along the eastern and western edges of the project site and would be located behind two 8-foot-tall gates, which would be installed to separate the general parking area from the truck storage and dock loading area.

Areas of Potential Environmental Effects: The EIR will evaluate the potential environmental impacts related to the proposed project, after having first established the environmental setting, or baseline, for the environmental analysis. The significance of potential impacts, cumulative impacts, and appropriate mitigation measures associated with the proposed project will be thoroughly discussed in the EIR. The EIR will be comprehensive and will evaluate each of the environmental issue topics required by CEQA. The individual environmental topics include:

- Aesthetics
- Air Quality
- Biological Resources
- Cultural Resources
- Energy
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Noise
- Transportation
- Tribal Cultural Resources
- Utilities and Service Systems

In addition, in accordance with Section 15126.6 of the CEQA Guidelines, the EIR will assess a range of reasonable alternatives to the project. The range of alternatives to be addressed will include alternatives that are specifically required by CEQA (e.g., the No Project Alternative), as well as other alternatives (intended to reduce or eliminate potentially significant impacts) as identified through the coordinated consultation and planning process.

Document Availability and Public Review Timeline: Due to the time limits mandated by State law, your response to the NOP must be sent no later than 30 days after publication of this notice. The review period for the NOP will be from September 9, 2022, to October 10, 2022. All documents related to this project are available for public review during normal business

Comment Letter A3 Attach.

hours (Monday - Friday, 8:00 A.M. – 5:00 P.M.) by appointment only, at the Planning and Development Department at 2600 Fresno Street, Room 3043, Fresno, CA 93721. Electronic copies may also be requested for review. Please contact Steven Martinez via e-mail or by phone to request electronic copies or to schedule an appointment to view documents. Documents related to this project can also be accessed on the City's website at: https://www.fresno.gov/darm/planning-development/plans-projects-under-review/.

Public Scoping Meeting: The CEQA process encourages comments and questions from the public throughout the planning process. Pursuant to Section 15083 of the CEQA Guidelines, a Public Scoping Meeting will be held to solicit public comments on the scope and content of the EIR. A public scoping meeting for this project will be conducted virtually at 6:00 PM on Thursday, September 22, 2022. The webinar information is provided below:

Via Zoom online meeting at: https://bit.ly/2740WestNielsen
Or by Phone at: +1 669 444 9171 US
Webinar ID: 868 6600 9238
Passcode: 154493

Submitting Comments: Comments and suggestions as to the appropriate scope of analysis of the EIR are encouraged from all interested parties. If you wish to provide comments or ask questions about the EIR, you may do so by written letter sent via post mail to the address below or via written email to PublicCommentsPlanning@fresno.gov (CC Steven.Martinez@fresno.gov). Comments must include the commenter's full name, address, phone number, and/or email so you may be contacted for clarification, if necessary. Please submit comments to Steven Martinez no later than 5:00 PM on October 10, 2022.

LETTER A3
Fresno Irrigation District

Laurence Kimura, P.E., Chief Engineer
May 17, 2023

Response A3-1: This comment provides an introduction to the comment letter and does not address the adequacy or completeness of the Recirculated Draft EIR; does not raise environmental issues; and does not request the incorporation of additional information relevant to environmental issues. Such comments do not require a response, pursuant to Section 15088(a) of the State CEQA Guidelines. No further response is necessary.

Response A3-2: This comment states that the Fresno Irrigation District (FID) previously reviewed and commented on the proposed project. Previous comments state that should the project include any street and/or utility improvements along Nielsen Avenue, Hughes Avenue, Marks Avenue, or in the vicinity, FID would require its review and FID would approve all plans. This comment is noted but does not pertain to the analysis or conclusions of the Recirculated Draft EIR; therefore, no further analysis is required.

Response A3-3: This comment provides a closing to the comment letter and does not question the adequacy of the analysis included in the Recirculated Draft EIR. No further response is required.

San Joaquin Valley AIR POLLUTION CONTROL DISTRICT

HEALTHY AIR LIVING™

May 18, 2023

Steven Martinez
City of Fresno
Planning and Development Department
2600 Fresno Street, Room 3043
Fresno, CA 93721

Project: Notice of Availability of Recirculated Draft Environmental Impact Report for the 2740 West Nielsen Avenue Office/Warehouse Project

District CEQA Reference No: 20230341

Dear Mr. Martinez:

The San Joaquin Valley Air Pollution Control District (District) has reviewed the Draft Environmental Impact Report (DEIR) from the City of Fresno (City) for the above mentioned project. Per the DEIR, the project consists of four office/warehouse buildings totaling approximately 901,438 square feet and 201 loading dock doors (Project). The Project is located at 2740 West Nielsen Avenue in Fresno, CA. **A4-1**

The District offers the following comments regarding the Project:

1) Assembly Bill 617

Assembly Bill 617 requires CARB and air districts to develop and implement Community Emission Reduction Programs (CERPs) in an effort to reduce air pollution exposure in impacted disadvantage communities. The Project lies near one of the impacted communities in the State selected by the California Air Resources Board (CARB) under the Assembly Bill (AB) 617 (2017, Garcia) and has the potential to expose sensitive receptors to increased air pollution within the nearby impacted community. The South Central Fresno CERP was adopted by the District's Governing Board in September of 2019 and identifies a wide range of measures designed to reduce air pollution exposure. Therefore, in an effort to reduce air pollution exposure to the impacted disadvantaged community, the District recommends the City incorporate mitigation measures outlined in the South Central Fresno CERP for the Project. For more information regarding the CERP approved for South Central Fresno, please visit the District's website at: http://community.valleyair.org/selected-communities/south-central-fresno **A4-2**

Printed on recycled paper.

2) Project Emissions

Based on the DEIR, specifically the Technical Appendices Volume I: Appendix C, the California Emissions Estimator Model (CalEEMod) air quality modeling results, includes a 7.3 mile trip length for quantifying Project operational air quality emissions from Heavy Heavy-Duty (HHD) Truck travel. This value represents the default CalEEMod trip length. This Project consists of warehouse development and is expected to generate increased HHD truck trips that have the ability travel further distances (e.g. trip length) for distribution. As a result, the Project related emissions resulting from the CalEEMod analysis may be underestimated. The trip length included in the DEIR is not consistent with trip length values we have seen for similar warehouse development projects and the DEIR lacks sufficient analysis to justify the use of the default value. The District recommends the DEIR be revised to include a project specific trip length value and associated analysis to justify the value. The DEIR and supporting CalEEMod air quality modeling results should be revised to reflect an appropriate trip length distance that is supported by project-specific factors.

A4-3

3) Recommended Feasible Mitigation for Operational Air Quality Impacts

3a) Voluntary Emission Reduction Agreement

Based on the above, criteria pollutant emissions may result in emissions exceeding the District's significance thresholds, potentially resulting in a significant impact on air quality. When a project is expected to have a significant impact, the District recommends the DEIR also include a discussion on the feasibility of implementing a Voluntary Emission Reduction Agreement (VERA) for this Project.

A VERA is a mitigation measure by which the project proponent provides pound-for-pound mitigation of emissions increases through a process that develops, funds, and implements emission reduction projects, with the District serving a role of administrator of the emissions reduction projects and verifier of the successful mitigation effort. To implement a VERA, the project proponent and the District enter into a contractual agreement in which the project proponent agrees to mitigate project specific emissions by providing funds for the District's incentives programs. The funds are disbursed by the District in the form of grants for projects that achieve emission reductions. Thus, project-related impacts on air quality can be mitigated. Types of emission reduction projects that have been funded in the past include electrification of stationary internal combustion engines (such as agricultural irrigation pumps), replacing old heavy-duty trucks with new, cleaner, more efficient heavy-duty trucks, and replacement of old farm tractors.
In implementing a VERA, the District verifies the actual emission reductions that have been achieved as a result of completed grant contracts, monitors the emission reduction projects, and ensures the enforceability of achieved

A4-4

reductions. After the project is mitigated, the District certifies to the Lead Agency that the mitigation is completed, providing the Lead Agency with an enforceable mitigation measure demonstrating that project-related emissions have been mitigated. To assist the Lead Agency and project proponent in ensuring that the environmental document is compliant with CEQA, the District recommends the environmental document includes an assessment of the feasibility of implementing a VERA.

A4-4 cont.

3b) Industrial/Warehouse Emission Reduction Strategies

The District recommends the City consider the feasibility of incorporating emission reduction strategies that can reduce potential harmful health impacts, such as those listed below:

- Locate loading docks a minimum of 300 feet away from the property line of sensitive receptor unless dock is exclusively used for electric trucks
- Incorporate signage and “pavement markings” to clearly identify on-site circulation patterns to minimize unnecessary on-site vehicle travel
- Locate truck entries on streets of a higher commercial classification
- Ensure all building roofs are solar-ready
- Ensure all portions of roof tops that are not covered with solar panels are constructed to have light colored roofing material with a solar reflective index of greater than 78
- Ensure rooftop solar panels are installed and operated to supply 100% of the power needed to operate all non-refrigerated portions of the development project
- Ensure power sources at loading docks for all refrigerated trucks have “plugin” capacity, which will eliminate prolonged idling while loading and unloading goods
- Incorporate bicycle racks and electric bike plug-ins
- Require the use of low volatile organic compounds (VOC) architectural and industrial maintenance coatings
- Designate an area during construction to charge electric powered construction vehicles and equipment, if temporary power is available
- Prohibit the use of non-emergency diesel-powered generators during construction
- Inform the project proponent of the incentive programs (e.g., Carl Moyer Program and Voucher Incentive Program) offered to reduce air emissions from the Project

A4-5

4) Health Risk Screening/Assessment

Based on the DEIR, specifically the Technical Appendices Appendix D: Health Risk Assessment (HRA), the truck travel particulate matter emission factors for 5-15 MPH and 5-55 MPH for 2-4 axle trucks and 5+ axle trucks are presented. However, the methodology and calculations for developing these emission factors is not shown or referenced. The District recommends the DEIR include the methodology and calculations used for developing the truck travel emissions factors in the HRA.

Also, the HRA did not consider air toxic emissions from potential warehouse equipment (e.g. forklifts, yard trucks, emergency backup generators, etc.) from operational activities. Should the Project include such equipment, the HRA should be revised to evaluate air toxic emissions and health impacts from these equipment types. Additionally, should the Project air quality emissions analysis be revised to reflect an updated trip length, the HRA should be revised for consistency.

A4-6

5) Ambient Air Quality Analysis

An Ambient Air Quality Analysis (AAQA) uses air dispersion modeling to determine if emissions increases from a project will cause or contribute to a violation of State or National Ambient Air Quality Standards. The District recommends an AAQA be performed for the Project if emissions exceed 100 pounds per day of any pollutant, especially if the Project related air quality emissions analysis is revised to reflect an updated trip length.

An acceptable analysis would include emissions from both project-specific permitted and non-permitted equipment and activities. The District recommends consultation with District staff to determine the appropriate model and input data to use in the analysis.

Specific information for assessing significance, including screening tools and modeling guidance, is available online at the District's website: www.valleyair.org/ceqa.

A4-7

6) Truck Routing

The Project consists of warehouse development and is expected to generated increased HHD truck trips. As a result, truck routing involves the assessment of which roads HHD trucks take to and from their destination, and the emissions impact that the HHD trucks may have on nearby sensitive receptors single family residential units located south of the Project.

The District recommends the City evaluate HHD truck routing patterns for the Project, with the aim of limiting exposure of residential communities and sensitive receptors to emissions. This evaluation would consider the current truck routes, the quantity and type of each truck (e.g., Medium Heavy-Duty, HHD, etc.), the

A4-8

destination and origin of each trip, traffic volume correlation with the time of day or the day of the week, overall Vehicle Miles Traveled (VMT), and associated exhaust emissions. The truck routing evaluation would also identify alternative truck routes and their impacts on VMT and air quality.

A4-8 cont.

7) Cleanest Available Heavy-Duty Trucks

The San Joaquin Valley will not be able to attain stringent health-based federal air quality standards without significant reductions in emissions from HHD trucks, the single largest source of NOx emissions in the San Joaquin Valley. The District's CARB-approved 2018 PM2.5 Plan includes significant new reductions from HHD trucks, including emissions reductions by 2023 through the implementation of CARB's Statewide Truck and Bus Regulation, which requires truck fleets operating in California to meet the 2010 standard of 0.2 g-NOx/bhp-hr by 2023. Additionally, to meet federal air quality attainment standards, the District's Plan relies on a significant and immediate transition of HHD fleets to zero or near-zero emissions technologies, including the near-zero truck standard of 0.02 g/bhp-hr NOx established by CARB.

A4-9

Per the DEIR, the Project is expected to generate increased HHD truck trips. The District recommends that the following measures be considered by the City to reduce Project-related operational emissions:

- *Recommended Measure*: Fleets associated with operational activities utilize the cleanest available HHD trucks, including zero and near-zero (0.02 g/bhp-hr NOx) technologies.

- *Recommended Measure*: All on-site service equipment (cargo handling, yard hostlers, forklifts, pallet jacks, etc.) utilize zero-emissions technologies.

8) Reduce Idling of Heavy-Duty Trucks

The goal of this strategy is to limit the potential for localized PM2.5 and toxic air contaminant impacts associated with the idling of Heavy-Duty trucks. The diesel exhaust from idling has the potential to impose significant adverse health and environmental impacts.

A4-10

The Project is expected to generate increased HHD truck trips, and as such, truck idling will be limited to 5 minutes in accordance with the states inti-idling regulation per the DEIR. However, the District recommends the City consider the feasibility of implementing a more stringent 3-minute idling restriction and requiring appropriate signage and enforcement of idling restrictions.

9) Electric On-Site Off-Road and On-Road Equipment

The Project consists of warehouse development and may have the potential to result in increased use of off-road equipment (e.g., forklifts) and on-road equipment (e.g., mobile yard trucks with the ability to move materials). The District recommends that the DEIR include requirements for project proponents to utilize electric or zero emission off-road and on-road equipment.

A4-11

10) Vegetative Barriers and Urban Greening

There are single family residential units located south and south east of the Project. The District suggests the City consider the feasibility of incorporating vegetative barriers and urban greening as a measure to further reduce air pollution exposure on sensitive receptors (e.g., residential units).

While various emission control techniques and programs exist to reduce air quality emissions from mobile and stationary sources, vegetative barriers have been shown to be an additional measure to potentially reduce a population's exposure to air pollution through the interception of airborne particles and the update of gaseous pollutants. Examples of vegetative barriers include, but are not limited to the following: trees, bushes, shrubs, or a mix of these. Generally, a higher and thicker vegetative barrier with full coverage will result in greater reductions in downwind pollutant concentrations. In the same manner, urban greening is also a way to help improve air quality and public health in addition to enhancing the overall beautification of a community with drought tolerant, low-maintenance greenery.

A4-12

11) On-Site Solar Deployment

It is the policy of the State of California that renewable energy resources and zero-carbon resources supply 100% of retail sales of electricity to California end-use customers by December 31, 2045. While various emission control techniques and programs exist to reduce air quality emissions from mobile and stationary sources, the production of solar energy is contributing to improving air quality and public health. The District suggests that the City consider incorporating solar power systems as an emission reduction strategy for the Project.

A4-13

12) Electric Vehicle Chargers

To support and accelerate the installation of electric vehicle charging equipment and development of required infrastructure, the District offers incentives to public agencies, businesses, and property owners of multi-unit dwellings to install electric charging infrastructure (Level 2 and 3 chargers). The purpose of the District's Charge Up! Incentive program is to promote clean air alternative-fuel technologies and the use of low or zero-emission vehicles. The District recommends that the City and project proponents install electric vehicle chargers at project sites, and at strategic locations.

A4-14

Please visit www.valleyair.org/grants/chargeup.htm for more information.

A4-14 cont.

13) District Rules and Regulations

The District issues permits for many types of air pollution sources, and regulates some activities that do not require permits. A project subject to District rules and regulations would reduce its impacts on air quality through compliance with the District's regulatory framework. In general, a regulation is a collection of individual rules, each of which deals with a specific topic. As an example, Regulation II (Permits) includes District Rule 2010 (Permits Required), Rule 2201 (New and Modified Stationary Source Review), Rule 2520 (Federally Mandated Operating Permits), and several other rules pertaining to District permitting requirements and processes.

A4-15

The list of rules below is neither exhaustive nor exclusive. Current District rules can be found online at: www.valleyair.org/rules/1ruleslist.htm. To identify other District rules or regulations that apply to future projects, or to obtain information about District permit requirements, the project proponents are strongly encouraged to contact the District's Small Business Assistance (SBA) Office at (559) 230-5888.

13a) District Rules 2010 and 2201 - Air Quality Permitting for Stationary Sources

Stationary Source emissions include any building, structure, facility, or installation which emits or may emit any affected pollutant directly or as a fugitive emission. District Rule 2010 (Permits Required) requires operators of emission sources to obtain an Authority to Construct (ATC) and Permit to Operate (PTO) from the District. District Rule 2201 (New and Modified Stationary Source Review) requires that new and modified stationary sources of emissions mitigate their emissions using Best Available Control Technology (BACT).

A4-16

This Project may involve equipment that is subject to District Rule 2010 (Permits Required) and Rule 2201 (New and Modified Stationary Source Review) and may require District permits. Prior to construction, the Project proponent should submit to the District an application for an ATC. For further information or assistance, the project proponent may contact the District's SBA Office at (559) 230-5888.

13b) District Rule 9510 - Indirect Source Review (ISR)

The Project is subject to District Rule 9510 because it will receives a project-level discretionary approval from a public agency and will equal or exceed 25,000 square feet of light industrial space.

A4-17

The purpose of District Rule 9510 is to reduce the growth in both NOx and PM emissions associated with development and transportation projects from mobile and area sources; specifically, the emissions associated with the construction and subsequent operation of development projects. The ISR Rule requires developers to mitigate their NOx and PM emissions by incorporating clean air design elements into their projects. Should the proposed development project clean air design elements be insufficient to meet the required emission reductions, developers must pay a fee that ultimately funds incentive projects to achieve off-site emissions reductions. For this Project, the District has received and approved an AIA application (ISR project #20220195).

A4-17 cont.

13c) District Rule 9410 (Employer Based Trip Reduction)

The Project may be subject to District Rule 9410 (Employer Based Trip Reduction) if the project would result in employment of 100 or more "eligible" employees. District Rule 9410 requires employers with 100 or more "eligible" employees at a worksite to establish an Employer Trip Reduction Implementation Plan (eTRIP) that encourages employees to reduce single-occupancy vehicle trips, thus reducing pollutant emissions associated with work commutes. Under an eTRIP plan, employers have the flexibility to select the options that work best for their worksites and their employees.

Information about District Rule 9410 can be found online at: www.valleyair.org/tripreduction.htm.

For additional information, you can contact the District by phone at 559-230-6000 or by e-mail at etrip@valleyair.org

A4-18

13d) District Rule 4601 (Architectural Coatings)

The Project may be subject to District Rule 4601 since it may utilize architectural coatings. Architectural coatings are paints, varnishes, sealers, or stains that are applied to structures, portable buildings, pavements or curbs. The purpose of this rule is to limit VOC emissions from architectural coatings. In addition, this rule specifies architectural coatings storage, cleanup and labeling requirements. Additional information on how to comply with District Rule 4601 requirements can be found online at: http://www.valleyair.org/rules/currntrules/r4601.pdf

A4-19

13e) District Regulation VIII (Fugitive PM10 Prohibitions)

The project proponent may be required to submit a Construction Notification Form or submit and receive approval of a Dust Control Plan prior to commencing any earthmoving activities as described in Regulation VIII, specifically Rule 8021 – *Construction, Demolition, Excavation, Extraction, and*

A4-20

Comment Letter A4 Cont.

Other Earthmoving Activities.

Should the project result in at least 1-acre in size, the project proponent shall provide written notification to the District at least 48 hours prior to the project proponents intent to commence any earthmoving activities pursuant to District Rule 8021 (Construction, Demolition, Excavation, Extraction, and Other Earthmoving Activities). Also, should the project result in the disturbance of 5-acres or more, or will include moving, depositing, or relocating more than 2,500 cubic yards per day of bulk materials, the project proponent shall submit to the District a Dust Control Plan pursuant to District Rule 8021 (Construction, Demolition, Excavation, Extraction, and Other Earthmoving Activities). For additional information regarding the written notification or Dust Control Plan requirements, please contact District Compliance staff at (559) 230-5950.

The application for both the Construction Notification and Dust Control Plan can be found online at:
https://www.valleyair.org/busind/comply/PM10/forms/DCP-Form.docx

Information about District Regulation VIII can be found online at:
http://www.valleyair.org/busind/comply/pm10/compliance_pm10.htm

A4-20 cont.

13f) Other District Rules and Regulations

The Project may also be subject to the following District rules: Rule 4102 (Nuisance) and Rule 4641 (Cutback, Slow Cure, and Emulsified Asphalt, Paving and Maintenance Operations).

A4-21

14) District Comment Letter

The District recommends that a copy of the District's comments be provided to the Project proponent.

A4-22

If you have any questions or require further information, please contact Harout Sagherian by e-mail at Harout.Sagherian@valleyair.org or by phone at (559) 230-5860.

Sincerely,

Brian Clements
Director of Permit Services

Mark Montelongo
Program Manager

LETTER A4
San Joaquin Valley Air Pollution Control District
Mark Montelongo
Program Manager
May 18, 2023

Response A4-1: This comment provides an introduction to the comment letter and does not address the adequacy or completeness of the Recirculated Draft EIR; does not raise environmental issues; and does not request the incorporation of additional information relevant to environmental issues. Such comments do not require a response, pursuant to Section 15088(a) of the State CEQA Guidelines. No further response is necessary.

Response A4-2: This comment encourages the City to incorporate mitigation measures outlined in the South Central Fresno Community Emission Reduction Programs (CERP). As discussed on page 4.2-22 of the Recirculated Draft EIR, South Central Fresno and the City of Shafter are the first Valley communities selected by the California Air Resources Board (CARB) for investment of additional resources under Assembly Bill (AB) 617. The Valley Air District has established a steering committee for each of these communities comprising community residents, businesses, community advocates, and government representatives to assist in the development and implementation of community air monitoring and emission reduction programs. Fresno's CERP was adopted by the CARB and is now in the implementation phase.

As discussed on pages 4.2-31 through 4.2-37 of the Recirculated Draft EIR, a health risk assessment (HRA) was prepared for the proposed project to evaluate the potential impact on sensitive receptors from construction and operation of the proposed project. The HRA evaluates the potential health risk to people living and working near the proposed project associated with the exhaust of diesel-powered trucks and equipment. This analysis was performed in a manner consistent with the goals of the CERP to reduce emissions of pollutants that have been shown to have adverse impacts on public health, including fine particulate matter and toxic air contaminants (TACs) in impacted disadvantaged communities. As shown in Table 4.2.J of the Recirculated Draft EIR, and based on the results of the construction HRA, construction of the proposed project with implementation of Mitigation Measure AIR-2, which requires the use of Tier 4 construction equipment, would not exceed San Joaquin Valley Air Pollution Control District (SJVAPCD) thresholds and would not expose nearby sensitive receptors to substantial pollutant concentrations. This impact would be less than significant.

In addition, as shown in Table 4.2.K, health risk levels from project operation to the nearest sensitive receptors would also be below SJVAPCD thresholds. Further, as described on pages 4.2-36 and 4.2-37 of the Recirculated Draft EIR, the California Communities Environmental Health Screening Tool

(CalEnviroScreen) identifies California communities by census tract that are disproportionately burdened by, and vulnerable to, multiple sources of pollution. Pollution Burden scores for each census tract are derived from the average percentiles of the seven exposure indicators (ozone and particulate matter of 2.5 microns or less [$PM_{2.5}$] concentrations, diesel particulate matter [DPM] emissions, drinking water contaminants, pesticide use, toxic releases from facilities, and traffic density) and the five Environmental Effects indicators (cleanup sites, impaired water bodies, groundwater threats, hazardous waste facilities and generators, and solid waste sites and facilities). According to the CalEnviroScreen 4.0 Map,[1] the project site has a pollution burden percentile of 97. Surrounding areas have pollution burdens ranging from 56 to 100.0. In addition, as identified on pages 4.2-36 and 4.2-37 of the Recirculated Draft EIR, according to the Senate Bill (SB) 535 Disadvantaged Communities Map,[2] the project area is designated as an SB 535 disadvantaged community. Based on the CalEnviroScreen results, the project area is already at an elevated risk level. Therefore, although the maximum cancer risk for the maximally exposed individual (MEI) would be 6.154 in one million, which is less than the SJVAPCD's project risk criteria of 20 in one million. Any additional risk increase is cumulatively potentially significant. Therefore, to reduce the cumulative health risk, through implementation of Mitigation Measure AIR-3 identified in the Recirculated Draft EIR, the project applicant shall ensure that the proposed project would provide the infrastructure for AC and/or DC chargers for electric heavy-duty trucks, which would further reduce TAC emissions. The infrastructure provided shall accommodate a minimum of one future charger per 50,000 square feet. With implementation of Mitigation Measure AIR-3, cumulative health risk impacts would be less than significant related to the exposure of sensitive receptors to substantial pollutant concentrations during project operation. Therefore, Mitigation Measures AIR-2 and AIR-3 reduce the exposure of sensitive receptors to potential health risk impacts, and implementation of these measures is consistent with the goals of the CERP to reduce air exposure in impacted disadvantaged communities and consistent with CERP measures related to Heavy Duty Mobile Sources and Emissions Exposure and Land Use.

Response A4-3: This comment states that the California Emissions Estimator Model (CalEEMod) air quality modeling includes a 7.3-mile trip length, which could be underestimated for a warehouse project.

As discussed in the Recirculated Draft EIR, the proposed project would result in the construction of four office/warehouse buildings that would be

1 Office of Environmental Health Hazard Assessment (OEHHA). 2021. *CalEnviroScreen 4.0.* Website: https://oehha.ca.gov/calenviroscreen/report/calenviroscreen-40 (accessed May 2021).

2 OEHHA. 2022. *SB 535 Disadvantaged Communities using CalEnviroScreen 4.0 results.* Website: https://experience.arcgis.com/experience/1c21c53da8de48f1b946f3402fbae55c/page/SB-535-Disadvantaged-Communities/.pdf (accessed October 2022).

configured for heavy industrial uses by tenants that have not been identified. As such, at this time, specific truck trip lengths are not yet known. As described further in Response B3-14, truck trips were not included in the VMT analysis, consistent with CEQA Guidelines Section 15064.3, subdivision (a), which states, "For the purposes of this section, 'vehicle miles traveled' refers to the amount and distance of automobile travel attributable to a project."

Further, as described in the SJVAPCD's Guidance for Assessing and Mitigating Air Quality Impacts (GAMAQI),[1] when quantifying project emissions, the latest approved models by the SJVAPCD should always be used for air quality analysis. As identified in the GAMAQI, the latest approved model available is CalEEMod. Therefore, consistent with SJVAPCD guidance, CalEEMod was used to evaluate project emissions. As described in the CalEEMod User Guide, CalEEMod utilizes widely accepted methodologies for estimating emissions combined with default data that can be used when site-specific information is not available.[2, 3] Sources of these methodologies and default data include but are not limited to the United States Environmental Protection Agency (USEPA) AP-42 emission factors, CARB vehicle emission models, and studies commissioned by California agencies such as the California Energy Commission (CEC) and the California Department of Resources Recycling and Recovery (CalRecycle). In addition, some local air districts provided customized values for their default data and existing regulation methodologies for use for projects located in their jurisdictions. When no customized information was provided, and no regional differences were defined for local air districts, statewide default values were utilized.

A majority of CalEEMod's default data associated with locations and land use are derived from surveys of existing land uses. For any project that substantially deviates from the types and features included in the surveys, site-specific data that are supported by substantial evidence should be used, if available. The model provides several opportunities for the user to change the defaults in the model; however, users are required to provide justification for all changes made to the default settings (e.g., reference more appropriate data sources), and no such data are available. The CalEEMod User Guide states that trip lengths are based on location and urbanization selected on the project characteristics screen and were supplied by the air districts or use a default average by the State, which is reported in Appendix D, Table 4.2 of

1 San Joaquin Air Pollution Control District. 2015. *Guidance for Assessing and Mitigating Air Quality Impacts (GAMAQI)*. March 19. Website: http://www.valleyair.org/transportation/GAMAQI.pdf (accessed May 2023).

2 California Air Pollution Control Officers Association. 2021. *California Emissions Estimator Model User's Guide.* May. Website: http://www.aqmd.gov/docs/default-source/caleemod/user-guide-2021/01_user-39-s-guide2020-4-0.pdf?sfvrsn=6 (accessed May 2023).

3 Detailed information regarding CalEEMod default assumptions can be found in the User's Guide: http://www.aqmd.gov/caleemod/user's-guide.

the CalEEMod User Guide. Appendix D, Table 4.2, of the CalEEMod User Guide shows that projects in urban areas within the SJVAPCD, such as the proposed project, would have a 7.3-mile trip length for commercial-nonwork trips and a 9.5-mile trip length for commercial-work trips. The trip lengths provided in Appendix D, Table 4.2, of the CalEEMod User Guide are based on trip length data provided by the SJVAPCD. Based on CalEEMod defaults and consistent with Appendix D, Table 4.2, of the CalEEMod User Guide, the CalEEMod modeling prepared for the proposed project assumes a 7.3-mile trip length for commercial-nonwork trips (41 percent of the project trips) and a 9.5-mile trip length for commercial-work trips (59 percent of the project trips). As such, since a project-specific truck trip length is not yet known, the use of CalEEMod defaults is appropriate for projects in the SJVAPCD and the city of Fresno and is consistent with standard practice.

Response A4-4: This comment recommends that an assessment be performed of the feasibility of implementing a Voluntary Emission Reduction Agreement (VERA). The VERA is a mitigation measure by which the project proponent provides pound-for-pound mitigation of emissions increases through a process that develops, funds, and implements emission reduction projects. The SJVAPCD is the administrator of the emissions reduction projects and verifier of the successful mitigation effort. As demonstrated on pages 4.2-26 through 4.2-31 of the Recirculated Draft EIR, construction and operational emissions associated with the proposed project would not exceed the SJVAPCD's significance criteria. The proposed project would be required to implement Mitigation Measure AIR-1, which includes SJVAPCD Regulation VIII measures for reducing fugitive dust emissions. However, since the proposed project would not generate emissions that would exceed SJVACPD thresholds, a VERA would not be required to reduce emissions to a less than significant level.

Response A4-5: This comment recommends the inclusion of several industrial/warehouse emission reduction strategies in the Recirculated Draft EIR. As noted on page 4.2-30 of the Recirculated Draft EIR, operational impacts associated with implementation of the proposed project would not exceed the SJVAPCD's significance criteria and would result in a less than significant impact; the commenter has not presented evidence to the contrary. Therefore, the Recirculated Draft EIR properly determined that the proposed project would not result in any significant impacts related to operational air quality. As such, identification and analysis of mitigation measures or the emission reduction strategies suggested in the comment would not be required to reduce emissions to a less than significant level.

Response A4-6: This comment requests that the Recirculated Draft EIR include the methodology and calculations for developing truck travel emission factors in the HRA. This comment further states that the HRA did not consider air toxic

emissions from potential warehouse equipment (e.g., forklifts, yard trucks, emergency backup generators) from operational activities.

The commenter is referred to pages 4.2-34 and 4.2-35 and Appendix D of the Recirculated Draft EIR for a discussion of the methodology and calculations for truck travel emission factors used in the HRA. As described in the Recirculated Draft EIR, the idling emissions of trucks operating on the project site were modeled in accordance with standard protocols as point sources within the area sources representing the planned loading docks. EMFAC2021 was used to determine the emissions factors of idling and operating diesel trucks to determine the total emissions of DPM. While it is expected that the truck emissions rate will continue to decrease over time, an HRA only allows for a single emission rate to represent the entire 70-year exposure period. Emissions factors for the year 2022 were used as a conservative estimate of emissions, although the project is not expected to be fully operational until 2025. Therefore, the commenter is incorrect that the methodology and calculations for developing truck travel emission factors in the HRA were not included in the Revised Draft EIR.

As discussed on pages 4.2-34 and 4.2-35 of the Recirculated Draft EIR, the proposed project would generate a total of 1,920 daily trips, with up to 342 truck trips per day. The trucks would access the site by North Hughes Avenue, West Nielsen Avenue, and North Marks Avenue. As identified in the Project Description, Building 1 would provide 122 loading dock doors; Building 2 would provide 46 loading dock doors; Building 3 would provide 18 loading dock doors; and Building 4 would provide 15 loading dock doors. As such, the proposed project would have a total of 201 loading dock doors. As the project would contain multiple loading docks, off-site queuing of trucks is not anticipated. While the TAC emissions from gasoline-powered vehicles have a small health effect compared to DPM, the HRA includes both gasoline- and diesel-powered vehicle emissions to represent reasonable worst-case conditions. For the diesel exhaust emissions, it is sufficient to only consider the DPM (particulate matter less than 10 microns in diameter [PM_{10}] and $PM_{2.5}$) portions of the exhaust; all the TACs for the gasoline exhaust emissions are contained in the reactive organic gas (ROG) emissions. Using speciation data from CARB, the emission rates of the TAC components are derived from the total ROG emissions.

Further, as discussed on pages 4.2-34 and 4.2-35, project trucks would operate in two modes: stationary idling and moving on and off the site. The emissions from trucks while idling result in a much higher concentration of TACs at nearby sensitive receptors compared to the emissions from moving trucks. This is due to the dispersion of emissions that occurs with distance and with travel of the vehicle. For this HRA, the truck travel emissions were modeled as a series of volume sources along the on-site driveway, along

North Marks Avenue going north and south of the site driveway, and along West Nielsen Avenue going east and west of the site driveway, consistent with standard methodology. LSA assumed vehicles traveling on site would maneuver slowly, averaging approximately 5-15 miles per hour (mph), and that vehicles traveling on roadways would average 5–55 mph.

As discussed on page 3-13 of the Recirculated Draft EIR, the proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. The use of equipment (e.g., forklifts, yard trucks, and emergency backup generators) would be dependent on specific tenants and is not being proposed as part of the project.

However, to be conservative, a supplemental analysis to evaluate potential emissions associated with on-site equipment (forklifts), emergency backup generators, and diesel fire pumps was conducted using CalEEMod. This supplemental analysis conservatively assumed that 40 diesel-powered forklifts would be used for 8 hours per day and that four diesel-powered 500-horsepower (HP) emergency backup generators and four diesel-powered 500 HP diesel fire pumps would be used for up to 50 hours per year. The results of the supplemental analysis, shown in Table A, below, indicate that the use of equipment, emergency backup generators, and diesel fire pumps would not exceed the significance criteria for annual ROG, nitrogen oxides (NO_X), carbon monoxide (CO), sulfur oxides (SO_X), PM_{10}, or $PM_{2.5}$ emissions. Because emissions would still be below the SJVAPCD's thresholds, operational emissions would still be considered less than significant.

Table A: Project Operation Emissions with Additional Stationary-Source Emissions (Tons per Year)

	ROG	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$
Area-Source Emissions	4.2	<0.1	<0.1	0.0	<0.1	<0.1
Energy-Source Emissions	0.1	0.8	0.7	<0.1	0.1	0.1
Mobile-Source Emissions	0.5	3.1	5.7	<0.1	2.2	0.6
Off-Road-Source Emissions	0.5	4.3	5.9	<0.1	0.2	0.2
Stationary-Source Emissions	0.2	0.5	0.4	<0.1	<0.1	<0.1
Total Project Operation Emissions	**5.4**	**8.6**	**12.7**	**<0.1**	**2.5**	**0.9**
SJVAPCD Significance Threshold	**10.0**	**10.0**	**100.0**	**27.0**	**15.0**	**15.0**
Exceed Threshold?	**No**	**No**	**No**	**No**	**No**	**No**

Source: Compiled by LSA (August 2023).
Note: Some values may not appear to add up correctly due to rounding.
CO = carbon monoxide
NO_X = nitrous oxides
$PM_{2.5}$ = particulate matter less than 2.5 microns in size
PM_{10} = particulate matter less than 10 microns in size
ROG = reactive organic gases
SJVAPCD = San Joaquin Valley Air Pollution Control District
SO_X = sulfur oxide

In addition, the SJVAPCD's GAMAQI states that TAC emissions are considered significant if an HRA shows an increased risk of greater than 20 in 1 million. The California Office of Environmental Health Hazard Assessment (OEHHA) *Air Toxic Hot Spots Program Risk Assessment Guidelines*[1] has determined that long-term exposure to diesel exhaust particulates poses the highest cancer risk of any TAC it has evaluated. In addition, CARB has also identified DPM emitted by off-road, diesel-fueled engines as a TAC.[2] As such, the TAC of concern would be DPM associated with the use of diesel engines during project construction. For risk assessment procedures, the OEHHA specifies that the surrogate for whole diesel exhaust is DPM. HRA analyses typically use PM_{10} emissions to represent DPM emissions, consistent with OEHHA guidance. As shown above, PM_{10} emissions, which are a surrogate for TAC emissions during construction, would result in pollutant emissions below the recommended thresholds, indicating that a significant health risk would also not occur.

However, it is important to note that the use of equipment, emergency backup generators, and diesel fire pumps would be dependent on specific tenants and is not being proposed as part of the project. Also, any equipment would be subject to permitting requirements and other regulations identified by CARB under Title 17, California Code of Regulations, Section 93155 (the Airborne Toxic Control Measure for Stationary Compression Ignition Engines), which sets strict emission standards for engines and limits on run times to reduce DPM and criteria pollutant emissions.

Response A4-7: The commenter is recommending an ambient air quality analysis (AAQA) using a dispersion model for projects that exceed 100 pounds per day of any pollutant. As shown in Table 4.2.H of the Recirculated Draft EIR, the proposed project would generate approximately 4.8 tons per year of ROG, 3.9 tons per year of NO_X, 6.4 tons per year of CO, less than 0.1 ton per year of SO_X, 2.3 tons per year of PM_{10}, and 0.7 ton per year of $PM_{2.5}$ emissions. When converted to pounds per day, the proposed project would generate approximately 26.3 pounds per day of ROG, 21.4 pounds per day of NO_X, 35.1 pounds per day of CO, 0.5 pound per day of SO_X, 12.6 pounds per day of PM_{10}, and 3.8 pounds per day of $PM_{2.5}$. As such, the proposed project's operational emissions would be well below 100 pounds per day for any pollutant. Therefore, an AAQA evaluation would not be required.

2 California Air Resources Board (CARB). 2022. *Proposed Amendments to the In-Use Off-Road Diesel-Fueled Fleets Regulation.* November 17. Website: https://ww2.arb.ca.gov/sites/default/files/barcu/board/res/2022/res22-19.pdf (accessed April 2023).

Response A4-8: This comment recommends an evaluation of heavy-duty (HHD) truck routing patterns for the project, with the aim of limiting exposure of residential communities and sensitive receptors to emissions. As discussed on page 4.2-35 of the Recirculated Draft EIR, truck travel emissions were modeled as a series of volume sources along the on-site driveway, along North Marks Avenue going north and south of the site driveway, and along West Nielsen Avenue going east and west of the site driveway. LSA assumed vehicles traveling on site would maneuver slowly, averaging approximately 5–15 mph, and that vehicles traveling on roadways would average 5–55 mph, consistent with standard methodology. As shown in Table 4.2-K of the Recirculated Draft EIR, operational health risks for the MEI would not exceed the SJVAPCD's thresholds. Further, as described in Response A4-2, although the maximum cancer risk for the MEI would be less than the project risk criteria of 20 in one million, to reduce the cumulative health risk, with implementation of Mitigation Measure AIR-3, the project applicant will ensure that the proposed project would provide the infrastructure for AC and/or DC chargers for electric heavy-duty trucks, which would further reduce TAC emissions. The infrastructure provided shall accommodate a minimum of one future charger per 50,000 square feet. With implementation of Mitigation Measure AIR-3, cumulative health risk impacts would be less than significant related to the exposure of sensitive receptors to substantial pollutant concentrations during project operation. In addition, as discussed on page 3-1 of the Recirculated Draft EIR, the project site is in close proximity to State Route 180 (SR-180), which is located approximately 0.3 mile south of the project site. In addition, there is a planned closure of the Belmont Avenue/State Route 99 (SR-90) on- and off-ramps. As such, it is expected that trucks would primarily access the project area using the Marks Avenue/SR-180 instead of traveling through residential communities. Therefore, further evaluation of truck routes is not necessary.

Response A4-9: This comment recommends the following measures to reduce project-related operational emissions: fleets associated with operational activities utilize the cleanest available HHD trucks, including zero and near-zero (0.02 grams per brake horsepower-hour [g/bhp-hr] NO_X) technologies; and all on-site service equipment (cargo handling, yard hostlers, forklifts, pallet jacks, etc.) utilize zero-emissions technologies.

As identified in Table 4.2-H of the Recirculated Draft EIR, the proposed project would not exceed the SJVAPCD's significance criteria for annual ROG, NO_X, CO, SO_X, PM_{10}, or $PM_{2.5}$ emissions. As such, operation of the proposed project would result in a less than significant impact related to a cumulatively considerable net increase of any criteria pollutant for which the proposed project region is in non-attainment under an applicable federal or State ambient air quality standard. Additionally, any future tenants that have HHD fleets would be required by law to meet the CARB's Statewide Truck and Bus

regulations, as well as the Advanced Clean Truck and forthcoming Advanced Clean Fleets regulations.

As discussed in the Recirculated Draft EIR, the proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. Therefore, the use of such equipment would be dependent on specific tenants and is not being proposed as part of the project. However, as discussed in Response A4-6, to be conservative, a supplemental analysis to evaluate potential emissions associated with equipment, emergency backup generators, and diesel fire pumps was conducted using CalEEMod. This supplemental analysis conservatively assumed that 40 diesel-powered forklifts would be used for 8 hours per day and that four diesel-powered 500 HP emergency backup generators and four diesel-powered 500 HP diesel fire pumps would be used for up to 50 hours per year. The results of the supplemental analysis, shown in Table A, above, indicate that the use of equipment, emergency backup generators, and diesel fire pumps would not exceed the significance criteria for annual ROG, NO_X, CO, SO_X, PM_{10}, or $PM_{2.5}$ emissions. Because emissions would still be below the SJVAPCD's thresholds for this very conservative scenario, operational emissions would still be considered less than significant. However, it is important to note that the use of equipment, emergency backup generators, and diesel fire pumps would be dependent on specific tenants and is not being proposed as part of the project.

Response A4-10: This comment recommends the City consider the feasibility of implementing a more stringent 3-minute idling restriction and requiring appropriate signage and enforcement of idling restrictions.

As discussed on page 4.2-35 of the Recirculated Draft EIR, the idling emissions of trucks operating on the project site were modeled as point sources within the area sources representing the planned loading docks. EMFAC2021 was used to determine the emissions factors of idling and operating diesel trucks to determine the total emissions of DPM. As demonstrated in Table 4.2.K of the Recirculated Draft EIR, operational health risks for the MEI would not exceed the SJVAPCD's thresholds. Further, as described in Response A4-2, although the maximum cancer risk for the MEI would be less than the project risk criteria of 20 in one million, to reduce the cumulative health risk, with the implementation of Mitigation Measure AIR-3, the project applicant shall ensure that the proposed project would provide the infrastructure for AC and/or DC chargers for electric heavy-duty trucks, which would further reduce $PM_{2.5}$ and TAC emissions. The infrastructure provided will be required to accommodate a minimum of one future charger per 50,000 square feet. With implementation of Mitigation Measure AIR-3, cumulative health risk impacts would be less than significant related to the exposure of sensitive

receptors to substantial pollutant concentrations during project operation. Therefore, further mitigation, such as more stringent idling restrictions, would not be necessary.

Response A4-11: This comment recommends that the Recirculated Draft EIR include requirements for project proponents to utilize electric or zero-emission off-road and on-road equipment.

As discussed in the Recirculated Draft EIR, the proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. Therefore, the use of such equipment would be dependent on specific tenants and is not being proposed as part of the project.

The results shown in Table 4.2.H of the Recirculated Draft EIR indicate the proposed project's operational emissions would not exceed the significance criteria for annual ROG, NO_X, CO, SO_X, PM_{10}, or $PM_{2.5}$ emissions. Therefore, operation of the proposed project would result in a less than significant impact related to a cumulatively considerable net increase of any criteria pollutant for which the proposed project region is in non-attainment under an applicable federal or State ambient air quality standard. As such, identification and analysis of mitigation measures is not required. In addition, as demonstrated in Response A4-6, a supplemental analysis to evaluate potential emissions associated with equipment, emergency backup generators, and diesel fire pumps was conducted using CalEEMod. The results of the supplemental analysis, shown in Table A, above, indicate that the use of equipment, emergency backup generators, and diesel fire pumps would not exceed the significance criteria for annual ROG, NO_X, CO, SO_X, PM_{10}, or $PM_{2.5}$ emissions. Because emissions would still be below the SJVAPCD's thresholds, operational emissions would still be considered less than significant. However, it is important to note that the use of equipment, emergency backup generators, and diesel fire pumps would be dependent on specific tenants and is not being proposed as part of the project.

In addition, as discussed above in Response A4-2, although the maximum cancer risk for the MEI would be less than the project risk criteria of 20 in one million to reduce the cumulative health risk, with the implementation of Mitigation Measure AIR-3, the project applicant shall ensure that the proposed project would provide the infrastructure for AC and/or DC chargers for electric heavy-duty trucks, which would further reduce TAC emissions. The infrastructure provided shall accommodate a minimum of one future charger per 50,000 square feet. With implementation of Mitigation Measure AIR-3, cumulative health risk impacts would be less than significant related to the exposure of sensitive receptors to substantial pollutant concentrations during project operation.

Response A4-12: This comment states that the City consider the feasibility of incorporating vegetative barriers and urban greening as a measure to further reduce air pollution exposure on sensitive receptors (e.g., residential units). As identified in Chapter 3.0, Project Description, of the Recirculated Draft EIR, consistent with City requirements, landscaping would be provided throughout the project site. The project would also include a vegetative plan that includes the planting of trees and other landscaping materials throughout the perimeter of the project site. In addition, as shown in Table 4.2.H of the Recirculated Draft EIR, the proposed project would not exceed the emission thresholds established by the SJVAPCD; therefore, additional mitigation is not required.

Response A4-13: This comment recommends that the City consider incorporating solar power systems as an emission reduction strategy for the project. As discussed in Chapter 3.0, Project Description, of the Recirculated Draft EIR, the proposed project would comply with the latest California Green Building Standards Code (CALGreen) building measures and 2022 Title 24 Building Energy Efficiency Standards (Title 24 Standards). The proposed project would also include cool roof materials. In addition, as described on pages 4.5-9 and 4.5-10 of the Recirculated Draft EIR, Pacific Gas and Electric (PG&E) is the private utility that would supply the proposed project's electricity and natural gas services. In 2021, a total of 50 percent of PG&E's delivered electricity came from renewable sources, including solar, wind, geothermal, small hydroelectric, and various forms of bioenergy.[1] PG&E reached California's 2020 renewable energy goal in 2017 and is positioned to meet the State's 60 percent by 2030 renewable energy mandate set forth in SB 100. In addition, PG&E plans to continue to provide reliable service to its customers and upgrade its distribution systems as necessary to meet future demand. As shown in Table 4.2.H, the proposed project would not exceed the emission thresholds established by the SJVAPCD. In addition, as demonstrated in Section 4.6, Energy, the proposed project would not result in inefficient, wasteful, and unnecessary consumption of energy and would not result in a significant energy impact. Therefore, additional mitigation, such as a solar power system emission reduction strategy, is not required.

Response A4-14: This comment recommends that the City and project proponents install electric vehicle chargers at project sites and at strategic locations. As discussed in Response A4-2, above, with the implementation of Mitigation Measure AIR-3, the project applicant shall ensure that the proposed project would provide the infrastructure for AC and/or DC chargers for electric HHD trucks, which would further reduce TAC emissions. The infrastructure provided shall accommodate a minimum of one future charger per 50,000

[1] Pacific Gas and Electric (PG&E). 2022. Exploring Clean Energy Solutions. https://www.pge.com/en_US/about-pge/environment/what-we-are-doing/clean-energy-solutions/clean-energy-solutions.page?WT.mc_id=Vanity_cleanenergy (accessed October 2022).

square feet. In addition, identified in the Project Description, the proposed project would comply with the latest CALGreen building measures and 2022 Title 24 Standards. The 2022 CALGreen code includes mandatory measures for non-residential projects, which apply to all new non-residential buildings, which include requirements for electric vehicle (EV) capable spaces in accordance with Table 5.105.5.3.1 of CALGreen.[1]

Response A4-15: This comment provides information on SJVAPCD rules and regulations and states that current District rules can be found online at: www.valleyair.org/rules/1ruleslist.htm. To identify other SJVAPCD rules or regulations that apply to future projects, or to obtain information about District permit requirements, the project proponents are strongly encouraged to contact the Small Business Assistance (SBA) Office at (559) 230-5888. This comment is noted. The proposed project would comply with all applicable SJVAPCD rules and regulations.

Response A4-16: This comment provides information on SJVAPCD applicable air quality permitting rules and regulations. The information provided in this comment is noted. The project does not propose any stationary sources of emissions.

Response A4-17: This comment states that the project is subject to SJVAPCD Rule 9510 (Indirect Source Review [ISR]) and that the District has received and approved an Air Impact Assessment (AIA) application (ISR project #20220195). The information provided in this comment is noted.

Response A4-18: This comment states that the project may be subject to SJVAPCD Rule 9410 (Employer Based Trip Reduction) if the project would result in employment of 100 or more "eligible" employees. SJVAPCD Rule 9410 requires employers with 100 or more "eligible" employees at a worksite to establish an Employer Trip Reduction Implementation Plan (eTRIP) that encourages employees to reduce single-occupancy vehicle trips, thus reducing pollutant emissions associated with work commutes. This comment is noted. The proposed project would comply with all required SJVAPCD rules and regulations. In addition, as identified in Appendix H, Greenhouse Gas Reduction Plan Update Checklist, of the Recirculated Draft EIR, the project would have over 100 employees and would be required to comply with SJVAPCD Rule 9410.

Response A4-19: This comment states that the project may be subject to SJVAPCD Rule 4601 (Architectural Coatings) since it may utilize architectural coatings. This

[1] International Code Council. 2023. *2022 California Green Building Standards Code, Title 24, Part 11 (CALGreen) – 5.106.5.3Electric vehicle (EV) charging.* Website: https://codes.iccsafe.org/s/CAGBC2022P1/chapter-5-nonresidential-mandatory-measures/CAGBC2022P1-Ch05-SubCh5.1-Sec5.106.5.3 (accessed May 2023).

comment is noted. The proposed project would comply with all required SJVAPCD rules and regulations.

Response A4-20: This comment states that the project may be required to submit a Construction Notification Form or submit and receive approval of a Dust Control Plan prior to commencing any earthmoving activities, as described in Regulation VIII, specifically Rule 8021 (Construction, Demolition, Excavation, Extraction, and Other Earthmoving Activities). This comment is noted. The proposed project would comply with all applicable SJVAPCD rules and regulations. In addition, as indicated in Section 4.2 Air Quality, the proposed project would be required to be consistent with SJVAPCD Regulation VIII.

Response A4-21: This comment states that the project may be subject to the following SJVAPCD rules: Rule 4102 (Nuisance) and Rule 4641 (Cutback, Slow Cure, and Emulsified Asphalt, Paving and Maintenance Operations). This comment is noted. The proposed project would comply with all required SJVAPCD rules and regulations.

Response A4-22: This comment provides a closing to the comment letter and does not question the adequacy of the analysis included in the Recirculated Draft EIR. No further response is required.

Comment Letter A5

City of FRESNO

DEPARTMENT OF PUBLIC UTILITIES

MEMORANDUM

DATE: December 14, 2022

TO: STEVEN MARTINEZ, Planner
Planning and Development Department

FROM: DEJAN PAVIC, PE, Projects Administrator
Department of Public Utilities – Utilities Planning & Engineering

SUBJECT: **DPU COMMENTS ON THE WATER SUPPLY ASSESSMENT (WSA) AND CHAPTERS 4.8 AND 4.11 OF ADMINISTRATIVE DRAFT ENVIRONMENTAL IMPACT REPORT (Admin Draft EIR) FOR SCANNELL OFFICE/WAREHOUSE PROJECT (2740 West Nielsen Avenue)**

In reference to the Water Supply Assessment ("WSA") and Chapters 4.8 and 4.11 of the Administrative Draft Environmental Impact Report ("Admin Draft EIR") for the proposed Scannell Office/Warehouse Project (at 2740 West Nielsen Avenue) ("Project") we offer the following comments: A5-1

Water Supply Assessment

1. General comment:

   The proposed Project-specific water demand is first mentioned on Page 43 (in the title), then discussed on Pages 45, 46, and 49: we recommend providing a 'summary statement' somewhere close to the beginning of the document. A5-2

2. WSA pg. 5, third paragraph:

   Various editions/additions related to the existing and proposed water and sewer mains (see the attached hand-marked PDF of pg. 5). A5-3

3. WSA pg. 6, first paragraph:

   Clarification on the data extracted from the 2020 UWMP (see the attached hand-marked PDF of pg. 6). A5-4

4. WSA pg. 18, bottom of third paragraph:

   References to the 29.0 percent cap and 'revised' City/FID agreement (see the attached hand-marked PDF of pg. 18). A5-5

5. WSA pg. 45, last two paragraphs:

   Please provide Project-specific water demand estimates (see the attached hand-marked PDF of pg. 45). A5-6

6. WSA pg. 46, bottom of paragraph:

   The statement of adequacy to be confirmed once the Project-specific water demand estimates are provided (see pg. 45 comment above) (see the attached hand-marked PDF of pg. 46). **A5-7**

7. WSA pg. 49, bottom of paragraph:

   The statement of adequacy to be confirmed once the Project-specific water demand estimates are provided (see pgs. 45 and 46 comments above) (see the attached hand-marked PDF of pg. 49). **A5-8**

Admin Draft EIR Chapter 4.8

1. Ch 4.8 pg. 4.8-1, first paragraph:

   Clarification on the data extracted from the 2020 UWMP; to 'match' WSA pg. 6 comment (see the attached hand-marked PDF of pg. 4.8-1). **A5-9**

2. Ch 4.8 pg. 4.8-14, third full paragraph:

   The statement of adequacy to be confirmed once the Project-specific water demand estimates are provided in WSA (see WSA pg. 45 comment above) (see the attached hand-marked PDF of pg. 4.8-14). **A5-10**

3. Ch 4.8 pg. 4.8-17, last full paragraph:

   Please provide Project-specific water demand estimates to 'match' WSA pg. 45 comments (see the attached hand-marked PDF of pg. 4.8-17). **A5-11**

4. Ch 4.8 pg. 4.8-18, first full paragraph:

   The statement of adequacy to be confirmed once the Project-specific water demand estimates are provided in WSA (see WSA pg. 45 comment above) (see the attached hand-marked PDF of pg. 4.8-18). **A5-12**

Admin Draft EIR Chapter 4.11

1. Ch 4.11 pg. 4.11-1, first paragraph:

   Clarification on the data extracted from the 2020 UWMP; to 'match' WSA pg. 6 comment (see the attached hand-marked PDF of pg. 4.11-1). **A5-13**

2. Ch 4.11 pg. 4.11-14, first and third full paragraphs:

   Various editions/additions related to the existing and proposed water and sewer mains; to 'match' WSA pg. 5 (see the attached hand-marked PDF of pg. 4.11-14). **A5-14**

Comment Letter
A5
Cont.

3. Ch 4.11 pg. 4.11-18, first paragraph:

   Please provide Project-specific water demand estimates to 'match' WSA pg. 45 comments (see the attached hand-marked PDF of pg. 4.11-18). **A5-15**

4. Ch 4.11 pg. 4.11-19, first full paragraph:

   The statement of adequacy to be confirmed once the Project-specific water demand estimates are provided in WSA (see WSA pg. 45 comment above) (see the attached hand-marked PDF of pg. 4.11-19). **A5-16**

5. Ch 4.11 pgs. 4.11-20 and 21, last paragraph beginning on pg. 4.11-20 and continuing on pg. 4.11-21:

   The statement of adequacy to be confirmed once the Project-specific water demand estimates are provided in WSA (see WSA pg. 45 comment above) (see the attached hand-marked PDF of pgs. 4.11-20 and 21). **A5-17**

Comment Letter
A5
Attach. #1

As shown in Figure 3, vehicular access to the site would be provided by North Hughes Avenue, West Nielsen Avenue, and North Marks Avenue.

A total of 594 on-site parking spaces would be provided for vehicles and trucks. Of the 594 parking spaces, 385 spaces would be dedicated for standard vehicles, 11 spaces would be dedicated for accessible standard vehicles, and 10 spaces would be dedicated for accessible vans. The remaining 188 spaces would be dedicated for trailers, would be located along the eastern and western edges of the project site, and would be behind two 8-foot-tall gates, which would be installed to separate the general parking area from the truck storage and dock loading area.

Consistent with City requirements, drought-tolerant landscaping would be provided throughout the project site.

The project site is located in an urban area and is currently served by existing utilities, including: water, sanitary sewer, storm drainage, electricity, and natural gas infrastructure. Water service to the project site would be provided by the City. New water within the project site would connect to the existing 14-inch main located on North Marks Avenue and the 16-inch main on North Hughes Avenue. The project would also include an on-site 12-inch main. The City would provide wastewater collection and treatment for the proposed project, and maintains an existing 12- to 18-inch line located in West Nielsen Avenue. The proposed project includes the installation of a new on-site 8-inch wastewater line that would connect to the City's existing line. The proposed project would include construction of a new curb and gutter along North Marks Avenue, West Nielsen Avenue, and North Hughes Avenue that would connect to the existing Fresno Metropolitan Flood Control District (FMFCD) stormwater system.

Electricity and natural gas services to the site are provided by Pacific Gas and Electric Company (PG&E). Existing underground utility connections and gas mains provide electricity and gas to the project site. New underground electrical lines would be installed.

Construction of the proposed project is anticipated to occur in two phases over a total 24-month period. The first phase would include the construction of Buildings 2, 3, and 4 and would occur for 12 months. The second phase would include the construction of Building 1 and would occur for 12 months. The proposed project would comply with City standards, including the City's current building code, landscape standards, and lighting standards. In addition, the proposed project would be graded similar to other developments throughout Fresno.

WATER SUPPLY RIGHTS AND ENTITLEMENTS

The City of Fresno relies on groundwater from the North Kings Subbasin; surface water from the Central Valley Project (CVP), through a contract with the United States Bureau of Reclamation (USBR); Kings River water, through a contract with Fresno Irrigation District (FID); and recycled water to meet current and future water demands. The following pages are extracted directly from the 2020 UWMP (Pages 6-1 through 6-32) in satisfaction of Water Code sections 10910(A)(1) and 10910(D)(2). This information is applicable to the entire City of Fresno municipal water service area, including the project site.

GROUNDWATER

The City overlies the Kings Subbasin, which is part of the greater San Joaquin Valley Groundwater Basin. The City is one of many water purveyors that use groundwater from the Kings Subbasin.

The City has a network of over 270 municipal wells and currently operates approximately 202 municipal supply wells within the Kings Subbasin. Until late 2004, the City relied solely on groundwater to meet the water demands. The City's desire is to continue to use groundwater within a larger conjunctive use program that maximizes its existing water rights and surface water supply sources.

Basin Description

The Department of Water Resources (DWR) has partitioned the State into 10 major hydrologic regions (also referred to as "basins") and then further divided each basin into subbasins. The City is located in the Kings Subbasin (DWR Groundwater Subbasin Number 5-22.08) and lies within the larger San Joaquin Valley Groundwater Basin in the Central Valley of California. The Kings Subbasin covers approximately 1,530 square miles.

Basin Location

The San Joaquin Valley Groundwater Basin is bounded to the north by the Sacramento-San Joaquin Delta and Sacramento Valley, to the east by the Sierra Nevada, to the south by the San Emigdio and Tehachapi mountains, and to the west by the Coast Ranges. The Kings Subbasin, located within the southern half of the San Joaquin Valley Groundwater Basin, is bounded to the north by the San Joaquin River, to the east by the alluvium-granite rock interface of the Sierra Nevada foothills, to the south by the southern fork of the Kings River, and to the west by the Delta-Mendota and Westside Subbasins. The Kings Subbasin is split into seven Groundwater Sustainability Agency (GSA) management areas, with Fresno located in the North Kings GSA. Figure 6-1 of the 2020 UWMP illustrates the location of Fresno within the Kings Subbasin.

Comment Letter

Attach. #1

restoration flows, unreleased recirculation flows, and uncontrolled season flows. The complexities of each water type are beyond the scope of this report but are mentioned here to reflect the other water acquisition opportunities afforded to the City through this contract. The San Joaquin River water supply has excellent water quality as it originates from snowmelt from the high Sierras and has not been detrimentally impacted.

Fresno Irrigation District Supply

FID is one of 28 agencies that receives an entitlement of water from the Kings River through the Kings River Water Association. Water entitlements for Kings River Water Association contract members are determined based on a methodology that was initially developed in 1917–1919 to establish entitlements for early claimed rights holders. The methodology was based on historic mean daily natural flow conditions at Piedra, which is approximately 3 miles downstream from the then yet to be built Pine Flat Dam and "at the heart of Kings River uses, regulation, and stream control and storage."

On December 20, 2016, the Revised, Amended, and Restated Cooperative Agreement was executed between FID and the City for Water Utilization and Conveyance (2016 FID Agreement). The 2016 FID Agreement replaces the 1976 Cooperative Agreement and ends in 2035. The agreement identifies the City's contracted percentage of FID's Kings River water based on the City's water service area located within the FID service area as a percentage of the FID land area. FID land area varies slightly every year because it is dependent on the acreage receiving water deliveries for that year rather than the total acreage within FID (roughly 200,000 acres). As the City incorporates new land area into its service area, the percentage of FID supply increases. However, the 2016 FID Agreement sets the maximum percentage as 29.0 percent, although the City's service area is anticipated to expand and encompass more than 29.0 percent of FID's service area between 2025 and 2030. In 2020, the City's percentage of overall FID Kings River deliveries was 25.79 percent. The FID Agreement identifies that the 29.0 percent maximum was based on moderate growth in Growth Area 1 of the City's SOI (shown in Exhibit C in the 2016 Agreement). As such, the supply projections in this plan limit the City's FID supply with the 29.0 percent cap, but if the agreement were revised in the future the City's FID allocation percentage could grow beyond 29.0 percent as the water service area expands.

amended

?

not relevant to this project (delete or revise as shown)

The City has historically not used all of its available allocation in any given year, although it pays a flat rate for its total allocation regardless of use. Water unused by the City is reallocated by FID to its other customers.

The City's potential supply from FID was summarized using actual Kings River deliveries for CYs 1964–2019, then categorized by the same WY types used for the USBR Friant supply. The range and average FID deliveries by WY type are shown in Table C. The average of all 56 CY delivery totals of FID Kings River deliveries is 452,541 AF, which equates to an average potential City supply of 131,237 AF, assuming the maximum 29.0 percent City supply

Source: 2020 Urban Water Management Plan, Figure 4-3 (City of Fresno 2021).

Figure 7: Existing and Projected Land Use

Assumptions

Project-specific water demand was calculated using the methodology from the 2020 UWMP, as described above, based on the following assumptions:

- Figure 7 above (Figure 4-3 of the 2020 UWMP) indicates there will be 5,201 acres of industrial uses in Fresno in 2025.
- Table M above (Table 4-6 of the 2020 UWMP) indicates the projected water demand for industrial land uses in 2025 will be 7,410 AFY.

Therefore, it is assumed that industrial land uses, such as the proposed project, will demand approximately 1.42 AFY per acre in 2025.

For planning purposes. Provide project-specific water demand

Proposed Project Water Demand

The total project site is 48.03 acres. Therefore, based on the assumptions identified above, the proposed project is estimated to demand approximately 68.2 AFY.

APPLICABILITY OF THE URBAN WATER MANAGEMENT PLAN

The proposed project site is included in the land use area covered by the City's 2020 UWMP. Figure 8 shows the location of the project site in relation to the water service area boundaries covered by the 2020 UWMP. In addition, Figure 9 shows the proposed project's designation of Heavy Industrial. As shown in Table 4-3 of the 2020 UWMP, land use acreages and water demand in the 2020 UWMP were based on the City's General Plan land use designations for 2020 and buildout in 2056. As such, as shown in Figure 9, the acreage associated with the proposed project was assumed Industrial in the 2020 UWMP; therefore, it is assumed that demand for water was accounted for in the 2020 UWMP. There is no evidence, in consideration of the calculated project water demand, that such demand exceeds that estimated in the 2020 UWMP. The adequacy of the water supply for the project is thus consistent with the basis of the analysis of the City's water supply in the adopted 2020 UWMP.

to be confirmed once project-specific water demand is addressed

ASSESSMENT FINDINGS

to be confirmed & (see pages 45 and 46)

It is concluded that the City of Fresno's water system has sufficient capacity to supply the proposed 2740 West Nielsen Avenue Office/Warehouse Project and other projected demands within the City's service area through the year 2045. Therefore, it is recommended that the City of Fresno Water Division approve this assessment and forward the report to the City of Fresno Planning Department for inclusion in the CEQA documentation for the proposed project.

4.8 HYDROLOGY AND WATER QUALITY

This section evaluates the potential environmental effects related to hydrology and water quality associated with the proposed project. This section also addresses local, State, and federal regulations as they pertain to project impacts on hydrology and water quality. A Water Supply Assessment (WSA)[1] was prepared for the proposed project (Appendix K). The WSA contains information from the City of Fresno 2020 Urban Water Management Plan (UWMP).[2]

4.8.1 Environmental Setting

The following discussion outlines the hydrological conditions of the City of Fresno.

4.8.1.1 Precipitation

Precipitation in the City of Fresno occurs mostly as rain during the months of November through April. Climate data collected from 1948 to 2016 shows that annual rainfall averaged 10.89 inches, but is variable. Recorded annual rainfall has ranged from a low of 3.01 inches in 2013 to a high of 21.61 inches in 1983.[3]

4.8.1.2 Hydrologic Setting

The City of Fresno is located in the Kings Subbasin and lies within the larger San Joaquin Valley Groundwater Basin in the Central Valley of California. The Kings Subbasin covers approximately 1,530 square miles. The San Joaquin Valley Groundwater Basin is bounded to the north by the Sacramento-San Joaquin Delta and Sacramento Valley, to the east by the Sierra Nevada, to the south by the San Emigdio and Tehachapi mountains, and to the west by the Coast Ranges. The Kings Subbasin, located within the southern half of the San Joaquin Valley Groundwater Basin, is bounded to the north by the San Joaquin River, to the east by the alluvium-granite rock interface of the Sierra Nevada foothills, to the south by the southern fork of the Kings River, and to the west by the Delta-Mendota and Westside subbasins. The Kings Subbasin is split into seven Groundwater Sustainability Agency (GSA) management areas, with Fresno located in the North Kings GSA.

4.8.1.3 Groundwater

The City of Fresno is underlain by the Kings River Subbasin, which, along with six other subbasins, comprises the San Joaquin Valley Groundwater Basin. In turn, the San Joaquin Basin is located within the Tulare Lake Hydrologic Region. The Tulare Lake Hydrologic Region spans approximately 10.9 million acres (17,000 square miles) and includes most of Fresno County. The Region encompasses the southern one-third of the Central Valley Regional Water Quality Control Board (RWQCB) jurisdiction.

use changes and development project proposals on water supply facilities by assigning fixed demand allocations to each parcel by land use as currently zoned or proposed to be rezoned.

The City relies on groundwater and surface water supplies to meet water demands. In 2006, Fresno updated its Metropolitan Water Resources Management Plan designed to ensure the Fresno metro area has a reliable water supply through 2050. The plan implements a conjunctive use program, combining groundwater, treated surface water, artificial recharge, and an enhanced water conservation program.

General Plan policies require the City to maintain a comprehensive conservation program to help reduce per capita water usage, and includes conservation programs such as landscaping standards for drought tolerance, irrigation control devices, leak detection and retrofits, water audits, public education and implementing U.S. Bureau of Reclamation Best Management Practices for water conservation to maintain surface water entitlements.

to be confirmed once WSA finalized

As described in the WSA prepared for the proposed project[5], the City has concluded that the City of Fresno's water system has sufficient capacity to supply the proposed 2740 West Nielsen Avenue Office/Warehouse Project and other projected demands within the City's service area through the year 2045. Additionally, implementation of the Fresno General Plan policies, the Kings Basin Integrated Regional Water Management Plan (IRWMP)[6], the City of Fresno UWMP, the Fresno-Area Regional Groundwater Management Plan[7], and the City of Fresno Metropolitan Water Resource Management Plan would address the continued provision of an adequate, reliable, and sustainable water supply for the proposed project. As such, the impact would be less than significant and no mitigation is required.

Level of Significance Without Mitigation: Less Than Significant Impact.

Threshold 4.8.3 **Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or through the addition of impervious surfaces, in a manner which would:**

Result in Substantial Erosion or Siltation On- or Off-Site? Erosion is a natural process in which soil is moved from place to place by wind or from flowing water. The effects of erosion within the project area can be accelerated by ground-disturbing activities associated with development. Siltation is the settling of sediment to the bed of a stream or lake which increases the turbidity of water. Turbid water can have harmful effects to aquatic life by clogging fish gills, reducing spawning habitat, and suppress aquatic vegetation growth.

Comment Letter
A5
Attach. #2

Threshold 4.8.5 **Would the project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?**

The City is located within the Kings Subbasin, which is part of the larger San Joaquin Valley Groundwater Basin. The planning documents regarding water resources for the City include Kings IRWMP , the City of Fresno UWMP, the Fresno-Area Regional Groundwater Management Plan , and the City of Fresno Metropolitan Water Resource Management Plan. As noted above, the proposed project would be required to adhere to NPDES drainage control requirements during construction and operation as well as to FMFCD drainage control requirements. As a result, the proposed project would not include any other waste discharges that could conflict with the IRWMP.

In addition, as discussed in the WSA prepared for the proposed project, the potable demand projections in the 2020 UWMP for normal water use utilize land use-based projections. Under this methodology, existing land use and demand was accounted separately from future land use and demand. This allows different demand factors to be applied to current land use areas and future land use areas. Future land use areas represent future customers and developments that are expected to be more water-efficient than existing land uses and buildings due to the California Plumbing Code (CPC) and use of higher-efficiency appliances and landscapes.

The existing and future land use acreage was sourced from the City's Geographic Information System (GIS) database and the City's General Plan. The existing land use shapefile and associated acreage for each land use classification were used to represent 2020 land use data. Areas not served by the City were excluded from the existing land use shapefile. The future land use shapefile corresponds with the planned land use at buildout as described in the City's General Plan representing the year 2056. Although the City does not have any plans to serve areas currently served by others within the City limits, all areas within the City's SOI were assumed to be served by the City by buildout for conservative planning purposes.

The land use acreage between 2020 and 2056 was estimated in 5-year increments based on areas planned to be developed by 2030 from the City's Planning Department, and by linearly interpolating the remainder of the change in acreage for each land use category between 2030 and 2056. Project-specific water demand was calculated using the methodology from the 2020 UWMP, as described above, based on the following assumptions:

- The 2020 UWMP indicates there will be 5,201 acres of industrial uses in Fresno in 2025; and
- The 2020 UWMP indicates the projected water demand for industrial land uses in 2025 will be 7,410 AFY.

Therefore, it is assumed that industrial land uses, such as the proposed project, will demand approximately 1.42 AFY per acre in 2025. The total project site is 48.03 acres. Therefore, based on the assumptions identified above, the proposed project is estimated to demand approximately 68.2 AFY.

SEE WSA pg. 45

The project site is included in the land use area covered by the City's 2020 UWMP and is designated as Heavy Industrial in the City's General Plan. Land use acreages and water demand in the 2020

UWMP were based on the City's General Plan land use designations for 2020 and buildout in 2056. As such, the acreage associated with the proposed project was assumed Industrial in the 2020 UWMP; therefore, it is assumed that demand for water was accounted for in the 2020 UWMP. There is no evidence, in consideration of the calculated project water demand, that such demand exceeds that estimated in the 2020 UWMP. The adequacy of the water supply for the project is thus consistent with the basis of the analysis of the City's water supply in the adopted 2020 UWMP.

The City has concluded that the City of Fresno's water system has sufficient capacity to supply the proposed project and other projected demands within the City's service area through the year 2045. Therefore, the proposed project would not conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan and impacts would be less than significant. No mitigation is required.

to be confirmed once WSA finalized

Level of Significance Without Mitigation: Less Than Significant Impact.

4.8.3.3 Cumulative Impacts

Buildout of the proposed project, along with construction and operation of other projects in the vicinity of the project site, would increase the amount of paved impervious surfaces within the City. This increase in impervious surfaces would increase stormwater runoff rates and volumes over those that occur from undeveloped land. This increase in runoff would have the potential to increase the amount of polluted runoff; however, all development projects within the Fresno-Clovis area would be required to comply with the MS4 Permit that requires the implementation of water quality and watershed protection measures. Compliance with the MS4 Permit would reduce potential impacts from cumulative projects to less than cumulatively significant. Since the development under the proposed project would also need to comply with the MS4 Permit, the Construction General Permit, a SWPPP, and specific policies of the General Plan identified above, the project's contribution to potential cumulative impacts would not be cumulatively considerable, and the project would result in a less than significant cumulative impact to stormwater.

The Kings Subbasin is in overdraft condition due to pumping for agricultural and urban uses. Growth in the subbasin will increase demands for groundwater pumping, potentially resulting in continued drawdown of water levels leading to localized cones of depression, changes in groundwater flow direction, concentration of contaminants, and land subsidence. This is a regional problem that is being addressed through several means including the formation of GSA's and the development of GSPs. The proposed project would implement applicable Fresno General Plan policies, the IRWMP, the City of Fresno 2020 UWMP, the Fresno-Area Regional Groundwater Management Plan, and the City of Fresno Metropolitan Water Resource Management Plan, which contain strategies to ensure adequate, reliable, and sustainable water supply for the City of Fresno. Additionally, as described above and in the WSA prepared for the proposed project, the City's water system has sufficient capacity to service the proposed project, as well as meet other projected demands in the City's service area. Therefore, the project's contribution to potential cumulative impacts to the Kings Subbasin would not be cumulatively considerable and the project would result in a less than significant cumulative impact to groundwater management in the Kings Subbasin.

Level of Significance Without Mitigation: Less Than Significant Impact.

NOTE: MR Draft 2020 UWMP (as in WSA) pg. 6

4.11 UTILITIES AND SERVICE SYSTEMS

This section addresses potential impacts to utilities and service systems including water supply, wastewater, stormwater, and solid waste resulting from implementation of the proposed project. The analysis in this section related to water supply is based on findings of the Water Supply Assessment[1] prepared for the proposed project (Appendix K). The Water Supply Assessment (WSA) was prepared pursuant to the requirements of Senate Bill (SB) 610, which requires public water agencies, parties, or purveyors that may supply water to certain proposed development projects to prepare a WSA for use in environmental documentation for such projects, pursuant to CEQA. The WSA contains information from the City of Fresno 2020 Urban Water Management Plan (UWMP).[2]

4.11.1 Environmental Setting

The following outlines the utilities and service systems in the Fresno area and in the vicinity of the project site.

4.11.1.1 Water Purveyor and System

The City's water system consists of about 1,860 miles of distribution and transmission mains, 260 municipal groundwater wells, three surface water treatment facilities (SWTFs) with current rated capacities ranging from 4 to 54 MGD, five water storage facilities with pump stations, including one at each of the SWTFs plus two in the distribution system, and three booster pump facilities. As of the close of the 2020 calendar year, the City has over 139,500 residential, commercial, industrial, and institutional water service connections and produced nearly 122,000 AF of water.

In addition to the City's water system, there are four independent water systems located within the City limits, including Bakman Water Company, Pinedale County Water District, California State University Fresno, and Park Van Ness Mutual Water Company. These independent water systems have their own water supplies, and do not receive water from the City, with the exception of a portion of the Pinedale County Water District east of Highway 41 and south of Herndon Avenue.

The City has emergency interties with the City of Clovis and California State University, Fresno, that provides additional water supply flexibility.

4.11.1.2 Water Demand

The City's 2020 UWMP estimated future water demands based on land use demand factors using 2018 metered consumption data. These demand factors were applied to the 2020 land use acreage by category to develop the demand projection beginning in 2020. Demand factors for land uses that grow over time and represent new developments were assigned a lower demand factor than the demand factors for existing development. Additionally, demand factors were assumed to slowly reduce over time due to passive conservation, which includes the replacement of older water fixtures and appliances with more efficient types. Table 4.11.A shows the projected annual water use by land use type for 2025, 2030, 2035, 2040, and 2045.

1 LSA. 2022. *SB 610 Water Supply Assessment, 2740 West Nielsen Avenue Office/Warehouse Project, Fresno, California*. July.

2 Fresno, City of. 2021. *City of Fresno 2020 Urban Water Management Plan*. June.

would not require the construction of new or expanded water conveyance, treatment, or collection facilities with respect to construction activities. Therefore, the impacts on water facilities during construction would be less than significant, and no mitigation is required.

modify per WSA comments

Once operational, water service to the project site would be provided by the City. New water within the project site would connect to the existing 14-inch main located on North Marks Avenue and the 16-inch main on North Hughes Avenue. The project would also include an on-site 12-inch main. Extension of the water infrastructure from the adjacent streets into the project site would be a routine part of the construction process analyzed in this EIR and would not have a material environmental impact. The water facility improvements would be limited to the project site and connection points to the adjacent, existing facilities. In addition, as described further in Threshold 4.11.2 below, the City has concluded that the City of Fresno's water system has sufficient capacity to supply the proposed project and other projected demands within the City's service area through the year 2045. Therefore, the proposed project would not require or result in the construction of new water facilities, or the expansion of existing facilities, which could cause a significant environmental impact, and the impact would be less than significant. No mitigation is required.

Wastewater. No significant increase in wastewater flows is anticipated as a result of construction activities on the project site. Sanitary services during construction would be provided by portable toilet facilities, which transport waste off-site for treatment and disposal. Therefore, during construction, potential impacts to wastewater treatment and wastewater conveyance infrastructure would be less than significant, and no mitigation would be required.

modify per WSA comments

Once operational, the City would provide wastewater collection and treatment for the proposed project, and maintains an existing 12- to 18-inch line located in West Nielsen Avenue. The proposed project includes the installation of a new on-site 8-inch wastewater line that would connect to the City's existing line. Any sewer improvements associated with the proposed project would be designed and constructed to City standards. In addition, the City of Fresno Department of Public Utilities has determined that adequate sanitary sewer and wastewater services would be available to serve the proposed project subject to the payment of any applicable connection charges and/or fees and extension of services in a manner that is compliant with the Department of Public Utilities standards, specifications, and policies. ***[City – this statement was included in the Public Review Draft IS/MND, can you provide a citation?]*** As such, the proposed project would result in less than significant impacts related to the construction or expansion of wastewater treatment facilities. Therefore, the proposed project would not require or result in the construction of new wastewater treatment or collection facilities, or the expansion of existing facilities, which could cause a significant environmental impact, and the impact would be less than significant. No mitigation is required.

refer to WSA

Stormwater and Drainage Facilities. During construction activities, soil would be exposed and disturbed, drainage patterns would be temporarily altered during grading and other construction activities, and there would be an increased potential for soil erosion and siltation compared to existing conditions. Additionally, during a storm event, soil erosion and siltation could occur at an accelerated rate. As discussed in Section 4.8, Hydrology and Water Quality, the proposed project would be required to comply with applicable permits and preparation of a SWPPP to identify construction BMPs to be implemented as part of the proposed project to reduce impacts to water

Therefore, it is assumed that industrial land uses, such as the proposed project, will demand approximately 1.42 AFY per acre in 2025. The total project site is 48.03 acres. Therefore, based on the assumptions identified above, the proposed project is estimated to demand approximately 68.2 AFY.

see WSA pg. 45

The project site is included in the land use area covered by the City's 2020 UWMP and is designated as Heavy Industrial in the City's General Plan. Land use acreages and water demand in the 2020 UWMP were based on the City's General Plan land use designations for 2020 and buildout in 2056. As such, the acreage associated with the proposed project was assumed Industrial in the 2020 UWMP; therefore, it is assumed that demand for water was accounted for in the 2020 UWMP. There is no evidence, in consideration of the calculated project water demand, that such demand exceeds that estimated in the 2020 UWMP. The adequacy of the water supply for the project is thus consistent with the basis of the analysis of the City's water supply in the adopted 2020 UWMP.

The City has concluded that the City of Fresno's water system has sufficient capacity to supply the proposed project and other projected demands within the City's service area through the year 2045. As such, the proposed project would not necessitate new or expanded water entitlements, and the City would be able to accommodate the increased demand for potable water.

The WSA also discusses projected supplies and demands for a normal year, single dry year, and 5-year consecutive drought in the City. The City is projected to have greater than 100,000 AF of available supply after meeting demands in normal years. During single dry years, the City's surface water supplies and groundwater recharge of raw surface water are reduced, but all projected potable demands would be met. During a 5-year drought, the City is projected to meet all demands with existing supplies, although non-potable water used for groundwater recharge is reduced in years 3 and 4 of a 5-year drought.

The City currently balances its surface water supplies and groundwater based on minimum production for operation of the City's water treatment facilities and minimum groundwater pumping to manage and control contamination plumes and prevent their spread. The minimum operation conditions typically occur in the low-demand winter months, and the City can increase surface water production during peak-demand months when surface water is available. In normal and wet years, the City intends to rely on more surface water supply and recharge raw surface water to replenish the groundwater basin and build storage for dry years. In dry years, when surface water is less available, the City will ramp up well production to meet demands. The City is expected to continue this supply management strategy in the future.

Additionally, the City's Water Shortage Contingency Plan (WSCP) is used to provide guidance to the City's governing body and staff and the public by identifying response actions to allow for efficient management of any water shortage with predictability and accountability. Preparation provides the tools to maintain reliable supplies and reduce the impacts of supply interruptions due to extended drought and catastrophic supply interruptions. The WSCP, applicable to the entire City of Fresno municipal water service area, is fully applicable to the project and protective of the adequacy of the project's water supply.

to be confirmed once WSA finalized

As a result, the project would result in a less-than-significant impact related to water supply and there would be sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years. No mitigation is required.

Level of Significance Without Mitigation: Less Than Significant Impact.

Threshold 4.11.3 **Would the project result in a determination by the wastewater treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?**

Wastewater collection and treatment services in Fresno are provided by the City of Fresno Department of Public Utilities. The City's wastewater collection system consists of about 1,630 miles of pipes ranging in size from 4 inches in diameter to 84 inches in diameter. This collection system also utilizes 15 lift stations throughout Fresno, ranging in pumping capacity from 0.25 million gallons per day (mgd) to 2.2 mgd. The City is served by two wastewater treatment plants: Fresno-Clovis Regional Wastewater Reclamation Facility and North Fresno Wastewater Reclamation Facility.

The Department of Public Utilities has determined that adequate sanitary sewer and wastewater services would be available to serve the proposed project subject to the payment of any applicable connection charges and/or fees and extension of services in a manner that is compliant with the Department of Public Utilities standards, specifications, and policies. As such, the City's wastewater provider would be able to provide service to the proposed project, and impacts would be less than significant. No mitigation is required.

Level of Significance Without Mitigation: Less Than Significant Impact.

Threshold 4.11.4 **Would the project generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?**

Garbage disposed in the City of Fresno is taken to the Cedar Avenue Recycling and Transfer Station. Once trash has been off-loaded at the transfer station, it is sorted, and non-recyclable solid waste is loaded onto large trucks and taken to the American Avenue Landfill located approximately 6 miles southwest of Kerman.

The American Avenue Landfill (i.e., American Avenue Disposal Site 10-AA-0009) has a maximum permitted capacity of 32,700,000 cubic yards and a remaining capacity of 29,358,535 cubic yards, with an estimated closure date of August 31, 2031. The maximum permitted throughput is 2,200 tons per day.[16]

[16] Ibid.

Other landfills within the County of Fresno include the Clovis Landfill (City of Clovis Landfill 10-AA-0004) with a maximum remaining permitted capacity of 7,740,000 cubic yards, a maximum permitted throughput of 2,000 tons per day, and an estimated closure date of 2047.[17]

Based on the California Emissions Estimator Model (CalEEMod, Appendix C), operation of the proposed project would generate approximately 847 tons of solid waste per year or approximately 2 tons of solid waste per day. Given the available capacity at the landfills, the additional solid waste generated by the proposed project is not anticipated to cause the facility to exceed its daily permitted capacity. As such, the project would be served by a landfill with sufficient capacity to accommodate the project's waste disposal needs. The proposed project would not generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals and impacts would be less than significant. No mitigation is required.

Level of Significance Without Mitigation: Less Than Significant Impact.

Threshold 4.11.5 Would the project comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

The proposed project would be required to comply with the CALGreen Code, the Fresno County C&D Debris Recycling Program, which is intended to assist the County in achieving AB 939 solid waste reduction goals, and other applicable federal, State and local solid waste statutes and/or regulations related to solid waste. In addition, as described above, the proposed project would not generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals. Therefore, the proposed project would have a less-than-significant impact related to solid waste. No mitigation is required.

Level of Significance Without Mitigation: Less Than Significant Impact.

4.11.3.3 Cumulative Impacts

As defined in the *State CEQA Guidelines*, cumulative impacts are the incremental effects of an individual project when viewed in connection with the effects of past, current, and probable future projects within the cumulative impact area for utilities and service systems. The project site consists of a vacant urban lot located in a primarily urban area with existing services provided by utility providers in the vicinity. The cumulative area for utilities is listed below for each individual utility provider.

Water Supply. As discussed above and in Section 4.8, Hydrology and Water Quality, water supply is a regional issue. The Kings Subbasin is in overdraft condition due to pumping for agricultural and urban uses. Growth in the subbasin will increase demands for groundwater pumping, potentially resulting in continued drawdown of water levels leading to localized cones of depression, changes in groundwater flow direction, concentration of contaminants, and land subsidence. However, the WSA prepared for the proposed project identified that projected water supplies available for the City would be adequate to accommodate future development in the City of Fresno, including

to be confirmed once WSA finalized

[17] Ibid.

development of the proposed project, for normal, single-year dry, and multiple-year dry conditions. Additionally, implementation of water supply management strategies and the City's WSCP would secure the efficient management of water supplies in the City during regular and dry years. Therefore, the City would have sufficient water supplies available to serve the proposed project and probably future projects. Therefore, the proposed project and the related projects would not have a cumulatively significant impact on water supply or facilities.

Wastewater. Public utility districts and other municipalities exist near or adjacent to the planning area and include the City of Clovis, the Pinedale Public Utility District, Pinedale County Water District, and Malaga Utility District. The City of Fresno Department of Public Utilities has determined that adequate sanitary sewer and water services would be available to serve the proposed project subject to the payment of any applicable connection charges and/or fees and extension of services in a manner that is compliant with the Department of Public Utilities standards, specifications, and policies. Other past, current, and probable future projects within the cumulative impact area would also be subject to Department of Public Utilities standards, specifications, and policies. For these reasons, the proposed project and related projects would not result in a cumulatively significant impact to wastewater generation.

Solid Waste. The geographic area for the cumulative analysis of solid waste infrastructure is the City of Fresno. Development associated with the proposed project would contribute to an increased demand for landfill capacity for solid waste. As stated previously, the American Avenue Landfill (i.e., American Avenue Disposal Site 10-AA-0009) has a maximum permitted capacity of 32,700,000 cubic yards and a remaining capacity of 29,358,535 cubic yards, with an estimated closure date of August 31, 2031. The maximum permitted throughput is 2,200 tons per day. In addition, the Clovis Landfill with a maximum remaining permitted capacity of 7,740,000 cubic yards, a maximum permitted throughput of 2,000 tons per day, and an estimated closure date of 2047. As discussed above, given the available capacity at the landfills, the additional solid waste generated by the proposed project is not anticipated to cause the facility to exceed its daily permitted capacity. Furthermore, based on their current daily maximum permitted disposal capacities and current average daily tonnage, there is currently sufficient permitted capacity provide adequate future capacity for the City's solid waste needs.

In addition, all development projects would be required to comply with federal, State, and local statutes and regulations related to solid waste. Pursuant to the California Integrated Waste Management Act of 1989 (AB 939), every city and county in the State is required to divert 50 percent of solid waste generated in its jurisdiction away from landfills. Implementation of source reduction measures, such as recycling, would serve to divert solid waste away from landfills. Cumulative development would be required to comply with existing statutes and regulations, and therefore, cumulative impacts related to compliance with solid waste regulations would be less than significant. Therefore, the proposed project's contribution to solid waste impacts would not be cumulatively considerable, and no mitigation is required.

Electricity and Natural Gas. Development of cumulative projects within the PG&E service area which encompasses 70,000 square miles would result in a substantial increase in electricity and natural gas demand as well as an increase in the consumption of fuel for vehicles. Although the proposed project would result in a net increase in demand for electricity, implementation of the

Steven,

Attached is a Memorandum with our comments on the Water Supply Assessment (WSA) **and** Chapters 4.8 and 4. 11 of the Admin Draft EIR (Admin Draft EIR) for the referenced project, along with PDFs of relevant pages of the WSA and Admin Draft EIR.

Please let me know if you need any additional information on this matter at this time.

Thank you,

Dejan

Hello Dejan and Brock, I hope you two are doing well.

Will you need additional time for review of Chapters 4.8 (Hydrology and Water Quality), 4.11 (Utilities and Service Systems), and the Water Supply Assessment of the Scannell Draft EIR? We can grant a small extension of time if needed. Please let me know.

If there are any questions, feel free to reach out to me.

Thank you.

Subject: Scannell Warehouse EIR - Water & Utility Comments

Hello Dejan and Brock, I hope you two are doing well.

The Planning Department is respectfully requesting your review of Chapters 4.8 (Hydrology and Water Quality) & 4.11 (Utilities and Service Systems) of the Scannell Office / Warehouse Draft Environmental Impact Report. The Word version of the section has been attached to this email. We hope the chapter is acceptable as is, however, comments and corrections are welcomed.

At this time, we would like your review complete by end of business on Thursday, December 1st; additional time may be granted if needed.

If there are any questions, feel free to reach out to me.

Thank you.
Steven Martinez - Planner

Importance:	High

Hi Steven,

It appears that **MOST (if ANY)** of our comments sent to you on December 14, 2022 (attached to this email) were **NOT INCORPORATED** into the DEIR.

As you probably recall, the majority of our comments were on the WSA (Water Supply Assessment; which is Appendix K to the DEIR), and then several comments on Chapters 4.8 and 4.11 were by reference to the comments on WSA. It doesn't appear that any of the comments made into the WSA, and consequently into those two chapters.

Thank you,

Dejan

Steven,

I am forwarding this on to Dejan. He has previously provided comments to EIR submittals.

LETTER A5
City of Fresno Department of Public Utilities
Dejan Pavic, PE
Projects Administrator
December 14, 2022, and March 29, 2023

Response A5-1: This comment letter and email was internally received by the City Planning and Development Department in December 2022 in response to the Administrative Draft EIR. The City did not previously address these internal comments in the document; therefore, responses are provided herein.

This comment provides an introduction to the comment letter and does not address the adequacy or completeness of the Recirculated Draft EIR; does not raise environmental issues; and does not request the incorporation of additional information relevant to environmental issues. Such comments do not require a response, pursuant to Section 15088(a) of the State CEQA Guidelines. No further response is necessary.

Response A5-2: This comment recommends providing a summary statement in the beginning of the Water Supply Assessment (Appendix K of the Recirculated Draft EIR). Therefore, in response to this comment, and as shown in Chapter 4.0 of this RTC Document, text on page 1 of Appendix K, Water Supply Assessment, of the Recirculated Draft EIR has been revised as follows:

EXECUTIVE SUMMARY

The proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. As such, the project-specific water usage is not yet known. Project-specific water demand was calculated based on the Water Study Demand Manual[1], which estimates that industrial uses demand approximately 0.9 acre-feet per year (AFY) per acre. The proposed project site is 48.03 acres; therefore, the proposed project is estimated to demand approximately 43.23 AFY.

The project water demand evaluated in this WSA will be compared to the water service planned for future industrial uses in the City using the City's adopted 2020 UWMP methodologies, which was calculated on the basis of the following assumptions:

- Figure 4-3 of the 2020 UWMP indicates there will be 5,201 acres of industrial uses in Fresno in 2025.

[1] Sacramento, City of. 2018. *Water Study Demand Manual*. January.

- Table 4-6 of the 2020 UWMP indicates the projected water demand for industrial land uses in 2025 will be 7,410 AFY.

Therefore, is the 2020 UWMP assumed that industrial land uses will demand approximately 1.42 AFY per acre in 2025. The total project site is 48.03 acres; therefore, based on the assumptions for water demand associated with industrial land uses identified above, the 2020 UWMP estimated approximately 68.2 AFY for the project site.

As identified above, the proposed project is estimated to demand approximately 43.23 AFY. As such, the proposed project's water demand is below the 68.2 AFY planned for the project site in the 2020 UWMP.

Since land use acreages and water demand in the 2020 UWMP were based on the City's General Plan land use designations for 2020 and buildout in 2056 and since the acreage associated with the proposed project was assumed Industrial in the 2020 UWMP, this WSA assumes that demand for water was accounted for in the 2020 UWMP. There is no evidence, in consideration of the calculated project water demand, that such demand exceeds that estimated in the 2020 UWMP. The adequacy of the water supply for the project is thus consistent with the basis of the analysis of the City's water supply in the adopted 2020 UWMP.

As such, this WSA concluded that the City of Fresno's water system has sufficient capacity to supply the proposed project and other projected demands within the City's service area through the year 2045.

This comment does not address the adequacy or completeness of the Recirculated Draft EIR; does not raise environmental issues; and does not request the incorporation of additional information relevant to environmental issues. As such, additional analysis is not required.

Response A5-3: This comment suggests various edits and additions related to the existing and proposed water and sewer mains to page 5 of Appendix K, Water Supply Assessment, of the Recirculated Draft EIR. Therefore, in response to this comment, and as shown in Chapter 4.0 of this RTC Document, text on page 5 of Appendix K, Water Supply Assessment, of the Recirculated Draft EIR has been revised as follows:

> The project site is located in an urban area and is currently served by existing utilities, including: water, sanitary sewer, storm drainage, electricity, and natural gas infrastructure. Water service to the project site would be provided by the City. New water within the

> project site would connect to the existing 14-inch main located on North Marks Avenue, ~~and~~ the 16-inch main on North Hughes Avenue, and the 14-inch main on West Nielsen Avenue. The project would also include an on-site private 12-inch water main. The City would provide wastewater collection and treatment for the proposed project, and maintains an existing 12- to 18-inch line located ~~in~~on West Nielsen Avenue, a 36-inch main on North Marks Avenue, and an 8-inch main on North Hughes Avenue. The proposed project includes the installation of a new on-site private 8-inch wastewater line that would connect to the City's existing lines. The proposed project would include construction of a new curb and gutter along North Marks Avenue, West Nielsen Avenue, and North Hughes Avenue that would connect to the existing Fresno Metropolitan Flood Control District (FMFCD) stormwater system.

This comment does not address the adequacy or completeness of the Recirculated Draft EIR; does not raise environmental issues; and does not request the incorporation of additional information relevant to environmental issues. As such, additional analysis is not required.

Response A5-4: This comment requests clarification of the data extracted from the 2020 Urban Water Management Plan (UWMP) on page 6 of Appendix K, Water Supply Assessment, of the Recirculated Draft EIR. Therefore, in response to this comment, and as shown in Chapter 4.0 of this RTC Document, text on page 6 of Appendix K, Water Supply Assessment, of the Recirculated Draft EIR has been revised as follows:

> The City of Fresno relies on groundwater from the North Kings Subbasin; surface water from the Central Valley Project (CVP), through a contract with the United States Bureau of Reclamation (USBR); Kings River water, through a contract with Fresno Irrigation District (FID); and recycled water to meet current and future water demands. The information provided on the following pages ~~are~~is extracted directly from the 2020 UWMP (Pages 6-1 through 6-32) in satisfaction of Water Code sections 10910(A)(1) and 10910(D)(2). This information is applicable to the entire City of Fresno municipal water service area, including the project site.

This comment does not address the adequacy or completeness of the Recirculated Draft EIR; does not raise environmental issues; and does not request the incorporation of additional information relevant to environmental issues. As such, additional analysis is not required.

Response A5-5: This comment requests removal of the references to the 29.0 percent cap and "revised" City/FID agreement on page 18 of Appendix K, Water Supply Assessment, of the Recirculated Draft EIR: Therefore, in response to this

comment, and as shown in Chapter 4.0 of this RTC Document, text on page 18 of Appendix K, Water Supply Assessment, of the Recirculated Draft EIR has been revised as follows:

> As such, the supply projections in this plan limit the City's FID supply with the 29.0 percent cap~~, but if the agreement were revised in the future the City's FID allocation percentage could grow beyond 29.0 percent as the water service area expands~~.

This comment does not address the adequacy or completeness of the Recirculated Draft EIR; does not raise environmental issues; and does not request the incorporation of additional information relevant to environmental issues. As such, additional analysis is not required.

Response A5-6: This comment requests project-specific water demand estimates. As discussed in the Recirculated Draft EIR, the proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. As such, at this time, project-specific water demand is not yet known. However, in response to this comment, and as shown in Chapter 4.0 of this RTC Document, text on page 45 of Appendix K, Water Supply Assessment, of the Recirculated Draft EIR has been revised as follows:

> **Assumptions**
>
> ~~Project-specific~~ The City's projected future water demand was calculated using the methodology from the 2020 UWMP, as described above, based on the following assumptions:
>
> - Figure 4-3 of the 2020 UWMP indicates there will be 5,201 acres of industrial uses in Fresno in 2025.
> - Table 4-6 of the 2020 UWMP indicates the projected water demand for industrial land uses in 2025 will be 7,410 AFY.
>
> Therefore, ~~it is~~the 2020 UWMP assumed that industrial land uses~~, such as the proposed project,~~ will demand approximately 1.42 AFY per acre in 2025. The total project site is 48.03 acres; therefore, based on the assumptions for water demand associated with industrial land uses identified above, the 2020 UWMP estimated approximately 68.2 AFY for the project site.
>
> **Proposed Project Water Demand**
>
> ~~The total project site is 48.03 acres. Therefore, based on the assumptions identified above, the proposed project is estimated to~~

~~demand approximately 68.2 AFY.~~The project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. In addition, at this time, the specific number of employees is not yet known. As such, the proposed project's water demand was calculated based on the Water Study Demand Manual[1], which estimates that industrial uses demand approximately 0.9 AFY per acre. The proposed project site is 48.03 acres; therefore, the proposed project is estimated to demand approximately 43.23 AFY. As such, the proposed project's water demand is below the 68.2 AFY planned for the project site in the 2020 UWMP.

This comment does not address the adequacy or completeness of the Recirculated Draft EIR; does not raise environmental issues; and does not request the incorporation of additional information relevant to environmental issues. As such, additional analysis is not required.

Response A5-7: This comment states that the statement of adequacy will be confirmed once the project-specific water demand estimates are provided. As discussed in Response A5-6, tenants have not been identified for the proposed project; as such, project-specific water demand is not yet known. Therefore, project-specific water demand was calculated based on United States Energy Information Administration Water Consumption data, which estimates that warehouse uses demand approximately 3.4 gallons per day per 1,000 square foot. The proposed buildings would result in a total gross floor area of approximately 901,438 square feet; therefore, the proposed project is estimated to demand approximately 3,064.8 gallons per day or approximately 3.4 AFY.

Furthermore, as discussed on page 46 of Appendix K, Water Supply Assessment, of the Recirculated Draft EIR, the proposed project site is included in the land use area covered by the City's 2020 UWMP. Land use acreages and water demand in the 2020 UWMP were based on the City's General Plan land use designations for 2020 and buildout in 2056. As such, the acreage associated with the proposed project was assumed Industrial in the 2020 UWMP; therefore, it is assumed that demand for water was accounted for in the 2020 UWMP. There is no evidence, in consideration of the calculated project water demand, that such demand exceeds that estimated in the 2020 UWMP. The adequacy of the water supply for the project is thus consistent with the basis of the analysis of the City's water supply in the adopted 2020 UWMP. Therefore, no further analysis is required.

[1] Sacramento, City of. 2018. *Water Study Demand Manual*. January.

Response A5-8: This comment states that the statement of adequacy will be confirmed once the project-specific water demand estimates are provided. Refer to Response A5-7, above.

Response A5-9: This comment requests the environmental setting in Section 4.8, Hydrology and Water Quality, of the Recirculated Draft EIR to match Appendix K, Water Supply Assessment. Section 4.8.1, Environmental Setting, of the Recirculated Draft EIR outlines the hydrological conditions of the City of Fresno, including precipitation, hydrologic setting, groundwater, surface water, stormwater draining, and inundation hazards. The information provided in Appendix K, Water Supply Assessment, of the Recirculated Draft EIR includes more detailed information taken directly from the 2020 UWMP and provides additional information beyond what is necessary for inclusion in Section 4.8, Hydrology and Water Quality. This comment is noted but does not pertain to the analysis or conclusions of the Recirculated Draft EIR; therefore, no further analysis is required.

Response A5-10: This comment states that the statement of adequacy will be confirmed once the project-specific water demand estimates are provided. Refer to Response A5-7, above.

Response A5-11: This comment requests that the project-specific water demand estimates match Appendix K, Water Supply Assessment, of the Recirculated Draft EIR. As discussed in Response A5-7, above, tenants have not been identified for the proposed project; as such, project-specific water demand is not yet known. Therefore, project-specific water demand was calculated based on the Water Study Demand Manual, which estimates that industrial uses demand approximately 0.9 AFY per acre. The proposed project site is 48.03 acres; therefore, the proposed project is estimated to demand approximately 43.23 AFY. In response to this comment, and as shown in Chapter 4.0 of this RTC Document, text on page 4.8-13 of the Recirculated Draft EIR has been revised as follows:

> ~~Project-specific~~The City's projected future water demand was calculated using the methodology from the 2020 UWMP, as described above, based on the following assumptions:
>
> - Figure 4-3 of the 2020 UWMP indicates there will be 5,201 acres of industrial uses in Fresno in 2025.
>
> - Table 4-6 of the 2020 UWMP indicates the projected water demand for industrial land uses in 2025 will be 7,410 AFY.
>
> Therefore, ~~it is~~the 2020 UWMP assumed that industrial land uses~~, such as the proposed project,~~ will demand approximately 1.42 AFY per acre in 2025. The total project site is 48.03 acres~~.~~; t~~T~~herefore,

based on the assumptions for water demand associated with industrial land uses identified above, the ~~proposed project is~~ 2020 UWMP estimated ~~to demand~~ approximately 68.2 AFY for the project site.

The project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. In addition, at this time, the specific number of employees is not yet known. As such, the proposed project's water demand was calculated based on the Water Study Demand Manual[1], which estimates that industrial uses demand approximately 0.9 AFY per acre. The proposed project site is 48.03 acres; therefore, the proposed project is estimated to demand approximately 43.23 AFY. As such, the proposed project's water demand is below the 68.2 AFY planned for the project site in the 2020 UWMP.

Response A5-12: This comment states that the statement of adequacy will be confirmed once the project-specific water demand estimates are provided. Refer to Response A5-7, above.

Response A5-13: This comment requests the environmental setting in Section 4.11, Utilities and Service Systems, of the Recirculated Draft EIR to match Appendix K, Water Supply Assessment. Section 4.11.1, Environmental Setting, of the Recirculated Draft EIR, provides a citation to refer to Appendix K and outlines the utilities and service systems in the Fresno area and in the vicinity of the project site, including the water purveyor and system, water demand, water supply, wastewater, stormwater, solid waste, and electric power, natural gas, and telecommunications. In addition, page 4.11-1 of the Recirculated Draft EIR states that the Water Supply Assessment contains information from the City's 2020 UWMP. The information provided in Appendix K, Water Supply Assessment, of the Recirculated Draft EIR includes more detailed information taken directly from the 2020 UWMP and provides additional information beyond what is necessary for inclusion in Section 4.11, Utilities and Service Systems. This comment is noted but does not pertain to the analysis or conclusions of the Recirculated Draft EIR; therefore, no further analysis is required.

Response A5-14: This comment suggests various edits and additions related to the existing and proposed water and sewer mains to page 4.11-14 of the Recirculated Draft EIR. Therefore, in response to this comment, and as shown in Chapter 4.0 of this RTC Document, text on page 4.11-14 of the Recirculated Draft EIR has been revised as follows:

[1] Sacramento, City of. 2018. *Water Study Demand Manual*. January.

> Once operational, water service to the project site would be provided by the City. New water within the project site would connect to the existing 14-inch main located on North Marks Avenue, ~~and~~ the 16-inch main on North Hughes Avenue, and the 14-inch main on West Nielsen Avenue. The project would also include an on-site private 12-inch water main. Extension of the water infrastructure from the adjacent streets into the project site would be a routine part of the construction process analyzed in this EIR and would not have a material environmental impact. The water facility improvements would be limited to the project site and connection points to the adjacent, existing facilities. In addition, as described further in Threshold 4.11.2 below, the City has concluded that the City of Fresno's water system has sufficient capacity to supply the proposed project and other projected demands within the City's service area through the year 2045. Therefore, the proposed project would not require or result in the construction of new water facilities, or the expansion of existing facilities, which could cause a significant environmental impact, and the impact would be less than significant.

In addition, in response to this comment, and as shown in Chapter 4.0 of this RTC Document, text on page 4.11-14 of the Recirculated Draft EIR has been revised as follows:

> Once operational, the City would provide wastewater collection and treatment for the proposed project, and maintains an existing 12- to 18-inch line located ~~in~~on West Nielsen Avenue, a 36-inch main on North Marks Avenue, and an 8-inch main on North Hughes Avenue. The proposed project includes the installation of a new on-site private 8-inch wastewater line that would connect to the City's existing line. Any sewer improvements associated with the proposed project would be designed and constructed to City standards. In addition, the City of Fresno Department of Public Utilities has determined that adequate sanitary sewer and wastewater services would be available to serve the proposed project subject to the payment of any applicable connection charges and/or fees and extension of services in a manner that is compliant with the Department of Public Utilities standards, specifications, and policies. In addition, as described further in Threshold 4.11.2 below, the City has concluded that the City of Fresno's wastewater system has sufficient capacity to supply the proposed project and other projected demands within the City's service area through the year 2045. As such, the proposed project would result in less than significant impacts related to the construction or expansion of wastewater treatment facilities. Therefore, the proposed project would not require or result in the construction of new wastewater

treatment or collection facilities, or the expansion of existing facilities, which could cause a significant environmental impact. Therefore, the impact would be less than significant.

This comment does not address the adequacy or completeness of the Recirculated Draft EIR; does not raise environmental issues; and does not request the incorporation of additional information relevant to environmental issues. As such, additional analysis is not required.

Response A5-15: This comment requests that the project-specific water demand estimates match Appendix K, Water Supply Assessment, of the Recirculated Draft EIR. As discussed in Response A5-7, above, tenants have not been identified for the proposed project; as such, project-specific water demand is not yet known. Therefore, project-specific water demand was calculated based on the Water Study Demand Manual, which estimates that industrial uses demand approximately 0.9 AFY per acre. The proposed project site is 48.03 acres; therefore, the proposed project is estimated to demand approximately 43.23 AFY. In response to this comment, and as shown in Chapter 4.0 of this RTC Document, text on page 4.11-18 of the Recirculated Draft EIR has been revised as follows:

> ~~Project-specific~~The City's projected future water demand was calculated using the methodology from the 2020 UWMP, as described above, based on the following assumptions:
>
> - Figure 4-3 of the 2020 UWMP indicates there will be 5,201 acres of industrial uses in Fresno in 2025.
>
> - Table 4-6 of the 2020 UWMP indicates the projected water demand for industrial land uses in 2025 will be 7,410 AFY.
>
> Therefore, ~~it is~~the 2020 UWMP assumed that industrial land uses~~, such as the proposed project,~~ will demand approximately 1.42 AFY per acre in 2025. The total project site is 48.03 acres~~.~~; t~~T~~herefore, based on the assumptions for water demand associated with industrial land uses identified above, the ~~proposed project is~~ 2020 UWMP estimated ~~to demand~~ approximately 68.2 AFY for the project site.
>
> The project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. In addition, at this time, the specific number of employees is not yet known. As such, the proposed project's water demand was calculated based on the Water

Study Demand Manual[1], which estimates that industrial uses demand approximately 0.9 acre-feet per year (AFY) per acre. The proposed project site is 48.03 acres; therefore, the proposed project is estimated to demand approximately 43.23 AFY. As such, the proposed project's water demand is below the 68.2 AFY planned for the project site in the 2020 UWMP.

Response A5-16: This comment states that the statement of adequacy will be confirmed once the project-specific water demand estimates are provided. Refer to Response A5-7, above.

Response A5-17: This comment states that the statement of adequacy will be confirmed once the project-specific water demand estimates are provided. Refer to Response A5-7, above.

Subject: Comments on 2740 West Nielsen Avenue Warehouse EIR (SCH NO. 2022050265)

Dear Mr. Martinez,

Thank you for the opportunity to comment on the Environmental Impact Report (EIR) for the proposed P21-02699 2740 West Nielsen Ave. Warehouse Project. Please accept and consider these comments on behalf of Golden State Environmental Justice Alliance (GSEJA). Also, Golden State Environmental Justice Alliance formally requests to be added to the public interest list regarding any subsequent environmental documents, public notices, public hearings, and notices of determination for this project. Send all communications to Golden State Environmental Justice Alliance P.O. Box 79222 Corona, CA 92877. **B1-1**

1.0 Summary

The project proposes to construct and operate four industrial fulfillment center buildings totaling 901,438 square feet (sf) on an approximately 48 acre vacant site. The four buildings would be comprised of the following: Building 1 would be 468,812 square feet and include 122 loading dock doors; Building 2 would be 248,786 square feet and include 46 loading dock doors; Building 3 would be 93,074 square feet and include 18 loading dock doors; and Building 4 would be 90,766 square feet and include 15 loading dock doors. The project site provides a total of 594 on-site parking spaces, including 407 passenger car parking spaces and 188 truck/trailer parking spaces. **B1-2**

3.0 Project Description

The Project Description states that "The proposed project would not require any soil import or export." There is no mechanism for public verification of this conclusion, such as a grading plan, included in the EIR. A revised EIR must be prepared to include a grading plan to determine the **B1-3**

quantity of soils/materials to be imported/exported from the site. These grading truck hauling trips must be included for all sections of environmental analysis, including but not limited to the Air Quality, Energy, Greenhouse Gas Emissions, and Transportation analysis.

The EIR does not include a detailed site plan, floor plan, grading plan, or elevations for the proposed project. The basic components of a Planning Application include a site plan, floor plan, grading plan, elevations, and written narrative. The figure provided in Figure 3-5: Site Plan has been edited for public review to remove any and all site-specific information. Providing a detailed site plan for public review in the EIR is vital as it provides information such as the earthwork quantity notes, parking requirements, site coverage, floor area ratio, etc. The site plan provided is not useful for public review and do not satisfy CEQA's requirements for meaningful disclosure. The elevations would provide information regarding building height that is utilized for Aesthetics analysis and compliance with the Fresno County ALUCP. The EIR has excluded these required application items from public review, which does not comply with CEQA's requirements for adequate informational documents and meaningful disclosure (CEQA § 15121 and 21003(b)). Incorporation by reference (CEQA § 15150 (f)) is not appropriate as these documents contribute directly to analysis of the problem at hand. The EIR must be revised to include all of these application items in their unedited and complete form, and recirculated for public review.

B1-3 cont.

4.2 Air Quality, 4.5 Energy, and 4.6 Greenhouse Gas Emissions

The EIR does not include for analysis relevant environmental justice issues in reviewing potential impacts, including cumulative impacts from the proposed project. This is especially significant as the surrounding community is highly burdened by pollution. According to CalEnviroScreen 4.0[1], CalEPA s screening tool that ranks each census tract in the state for pollution and socioeconomic vulnerability, the proposed project s census tract (6019000700) ranks in the 100th percentile, indicating that it is among the most polluted census tracts in the state. The surrounding community, including residences adjacent to the south and adjacent SB 535 Census Tracts 6019002000 (north), 6019000200 (east), 6019000800 (south), and 6019001900 (west) bears the impact of multiple sources of pollution and is more polluted than average on several pollution indicators measured by CalEnviroScreen. For example, the project census tract ranks in the 82nd percentile for ozone burden, the 96th percentile for particulate matter (PM) 2.5 burden, and the 57th percentile for diesel particulate matter burden. All of these environmental factors are attributed to heavy trucks and industrial activity in the area. Ozone can cause lung irritation, inflammation, and worsening of existing chronic health conditions, even at low levels of exposure[2]. The very small particles of

Comment Letter B1 Cont.

diesel PM can reach deep into the lung, where they can contribute to a range of health problems. These include irritation to the eyes, throat and nose, heart and lung disease, and lung cancer[3]. B1-4 cont.

The census tract ranks in the 94th percentile for hazardous waste impacts. Hazardous waste generators and facilities contribute to the contamination of air, water and soil near waste generators and facilities can harm the environment as well as people[4]. The census tract also bears more impacts from cleanup sites than 77% of the state. Chemicals in the buildings, soil, or water at cleanup sites can move into nearby communities through the air or movement of water[5].

The census tract also ranks in the 84th percentile for contaminated drinking water and 45th percentile for groundwater threats. Poor communities and people in rural areas are exposed to contaminants in their drinking water more often than people in other parts of the state[6]. People who live near contaminated groundwater may be exposed to chemicals moving from the soil into the air inside their homes[7]. B1-5

The census tract also ranks in the 78th percentile for solid waste facility impacts, which can expose people to hazardous chemicals, release toxic gases into the air (even after these facilites are closed), and chemicals can leach into soil around the facility and pose a health risk to nearby populations[8].

Further, the census tract is a diverse community including 66% Hispanic, 19% African-American, and 8% Asian-American residents, whom are especially vulnerable to the impacts of pollution. The community has a high rate of low educational attainment, meaning 91% of the census tract over age 25 has not attained a high school diploma. The community also has a high rate of poverty, meaning 95% of the households in the census tract have a total income before taxes that is less than the poverty level. Income can affect health when people cannot afford healthy living and working conditions, nutritious food and necessary medical care[9]. Poor communities are often located in areas with high levels of pollution[10]. Poverty can cause stress that weakens the immune system and causes people to become ill from pollution[11]. Living in B1-6

[11] Ibid.

poverty is also an indication that residents may lack health insurance or access to medical care. Medical care is vital for this census tract as it ranks in the 95th percentile for incidence of cardiovascular disease and 98th percentile for incidence of asthma. The community also has a high rate of linguistic isolation, meaning 79% of the census tract speaks little to no English and faces further challenges and inequities due to this.

Additionally, the project census tract (6019000700) and census tracts adjacent to the project site (6019002000 (north), 6019000200 (east), 6019000800 (south), and 6019001900 (west)) are identified as SB 535 Disadvantaged Communities[12]. This indicates that cumulative impacts of development and environmental impacts in the area are disproportionately impacting these communities. The negative environmental, health, and quality of life impacts resulting form a saturation of the warehousing and logistics industry in the City have become distinctly inequitable. The severity of significant and unavoidable impacts particularly on these Disadvantaged Communities must be included for analysis as part of a revised EIR. Each section of the EIR must include the specific analysis of each environmental impact on the Disadvantaged Communities, including cumulative analysis and irreversible environmental effects.

B1-6 cont.

California s Building Energy Code Compliance Software (CBECC) is the State's only approved energy compliance modeling software for non-residential buildings in compliance with Title 24[13]. CalEEMod is not listed as an approved software. The CalEEMod modeling does not comply with the 2022 Building Energy Efficiency Standards and under-reports the project s significant Energy impacts and fuel consumption to the public and decision makers. Since the EIR did not accurately or adequately model the energy impacts in compliance with Title 24, a finding of significance must be made. A revised EIR with modeling using the approved software (CBECC) must be circulated for public review in order to adequately analyze the project s significant environmental impacts. This is vital as the EIR utilizes CalEEMod as a source in its methodology and analysis, which is clearly not the approved software.

B1-7

4.7 Hazards and Hazardous Materials

The proposed Project site is within Chandler Executive Airport Traffic Pattern Zone (TPZ) and Outer Approach/Departure Zone (OADZ). The Fresno County Airport Land Use Compatibility Plan Update was adopted by the ALUC on December 3, 2018 and amended December 2021[14]. The

B1-8

[12] OEHHA SB 535 Census Tracts https://oehha.ca.gov/calenviroscreen/sb535
[13] California Energy Commission 2022 Energy Code Compliance Software https://www.energy.ca.gov/programs-and-topics/programs/building-energy-efficiency-standards/2022-building-energy-efficiency-1
[14] Fresno County Airport Land Use Commission https://www.fresnocog.org/project/airport-land-use-commission-fresno-county/

EIR states that "The City of Fresno Development Code Priority of Plans section mentioned above (Section 15-104-B.4) clearly establishes the adopted Fresno County Airport Land Use Compatibility Plan as the plan that takes precedence over all of the City s other land use plans within the Airport Influence Areas defined in the Plan" to conclude that there will be less than significant impacts. The California Airport Land Use Planning Handbook[15] states that Airport Land Use Commission review is required "when a local jurisdiction has neither revised its local plan(s) to be consistent with the ALUCP (PUC Section 21676.5(a))." The City's General Plan was adopted on December 18, 2014 and has not been updated to be consistent with the Fresno County Airport Land Use Compatibility Plan Updates of December 3, 2018 and amended December 2021. The City's Development Code is not equivalent to the General Plan review and analysis necessary to determine consistency with the new ALUCP. ALUC review of the revised General Plan would be required to ensure consistency with the ALUCP. Therefore, ALUC review of the proposed project is required pursuant to PUC Section 21676.5(a) and the EIR must be revised to include this information for analysis and include a finding of significance because the review has not occurred. B1-8 cont.

Further, the EIR is inadequate as it states "the project contemplates densities below those required in TPZs and OADZs and the project would include over 20 percent open land," but does not provide any meaningful evidence to support this claim. The EIR does not include a calculation for compliance with the maximum intensity of 300 persons per acre (TPZ area) or 150 persons per acre (OADZ area). A revised EIR must be prepared with a calculation of the project's maximum intensity of people per acre in order to accurately and adequately analyze the potentially significant impacts.

4.10 Transportation

As noted above, the EIR does not demonstrate compliance with the following Transportation related General Plan policies:

1. MT-1-n Peak Hour Vehicle LOS. Maintain a peak-hour vehicle LOS standard of D or better for all roadway areas outside of identified Activity Center and Bus Rapid Transit Corridor districts, unless the City Traffic Engineer determines that mitigation to maintain this LOS would be infeasible and/or conflict with the achievement of other General Plan policies. B1-9

2. MT-2-i Transportation Impact Studies. Require a Transportation Impact Study (currently named Traffic Impact Study) to assess the impacts of new development projects on existing

[15] California Airport Land Use Planning Handbook https://dot.ca.gov/-/media/dot-media/programs/aeronautics/documents/californiaairportlanduseplanninghandbook-a11y.pdf

and planned streets for projects meeting one or more of the following criteria, unless it is determined by the City Traffic Engineer that the project site and surrounding area already has appropriate multi-modal infrastructure improvements.

A) Transportation impact criteria are tiered based on a project s location within the City s Sphere of Influence. This is to assist with areas being incentivized for development. The four zones, as defined on Figure MT-4, are listed below. The following criteria apply:

A) Traffic Impact Zone II (TIZ-II): TIZ-II generally represents areas of the City currently built up and wanting to encourage infill development. Maintain a peak hour LOS standard of E or better for all intersections and roadway segments. A TIS will be required for all development projected to generate 200 or more peak hour new vehicle trips.

B1-9 cont.

Although LOS analysis is not required to determine Transportation impacts, it is fully required to determine compliance with the General Plan. This contributes Land Use and Planning impacts. As noted above, the EIR and Transportation Appendix concludes the project will result in LOS F during the PM peak hour at Intersection 1 - Marks Avenue/Belmont Avenue in cumulative year 2035. The EIR is not adequate as an informational document because it has not analyzed compliance with these policies. The EIR must be revised with this information for analysis in order to provide an adequate and accurate environmental document.

Further, the EIR has underreported the quantity of VMT generated by project operations. The operational nature of industrial/warehouse uses involves high rates of truck/trailer/delivery van VMT due to traveling from large import hubs to regional distribution centers to smaller industrial parks and then to their final delivery destinations. Once employees arrive at work at the proposed fulfillment center, they will conduct their jobs by driving delivery vans across the region as part of the daily operations as a fulfillment center, which will drastically increase project-generated VMT. The project's truck/trailer and delivery van activity is unable to utilize public transit or active transportation and it is misleading to the public and decision makers to exclude this activity from VMT analysis. The project's actual VMT generated during operations is not consistent with the significance threshold and legislative intent of SB 743 to reduce greenhouse gas emissions by reducing VMT. A revised EIR must be prepared to reflect a quantified VMT analysis that includes all truck/trailer and delivery van activity in order to provide an adequate and accurate environmental analysis.

B1-10

The EIR has not adequately analyzed the project's potential to substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses; or the project's potential to result in inadequate emergency access. The EIR has not provided any exhibits depicting the available truck/trailer turning radius at the project driveways or the

B1-11

Comment Letter B1 Cont.

intersections of Hughes Ave./Nielsen Ave. or Marks Ave./Nielsen Ave. to determine if there is enough space available to accommodate heavy truck maneuvering. Figure 3-5 Site Plan does not depict an analysis of adequate on-site heavy truck maneuvering, either. The exhibit does not depict two or more trucks attempting to turn corners around the site, park, etc across the site at any point. There are also no exhibits depicting emergency vehicle access. Deferring this environmental analysis required by CEQA to the construction permitting phase is improper mitigation and does not comply with CEQA's requirement for meaningful disclosure and adequate informational documents. A revised EIR must be prepared for the proposed project with this analysis in order to provide an adequate and accurate environmental analysis.

B1-11 cont.

5.0 Alternatives

The EIR is required to evaluate a reasonable range of alternatives to the proposed project which will avoid or substantially lessen any of the significant effects of the project (CEQA § 15126.6.) The two alternatives chosen for analysis include the CEQA required "No Project" alternative and only one other alternative - Reduced Project Alternative. The EIR does not evaluate a reasonable range of alternatives as only one alternative beyond the required No Project alternative is analyzed. The EIR must be revised to include analysis of a reasonable range of alternatives and foster informed decision making (CEQA § 15126.6). This could include alternatives such as development of the site with a mixed-use project that provides affordable housing and local-serving commercial uses that may reduce VMT, GHG emissions, and improve Air Quality.

B1-12

6.0 CEQA Required Assessment Conclusions

Effects Found Not to be Significant

Land Use and Planning

The EIR/Initial Study does not provide a consistency analysis with all applicable Fresno General Plan goals and policies. A revised EIR must be prepared with this analysis, including the following policies:

B1-13

1. MT-1-n Peak Hour Vehicle LOS. Maintain a peak-hour vehicle LOS standard of D or better for all roadway areas outside of identified Activity Center and Bus Rapid Transit Corridor districts, unless the City Traffic Engineer determines that mitigation to maintain this LOS would be infeasible and/or conflict with the achievement of other General Plan policies.

2. MT-2-i Transportation Impact Studies. Require a Transportation Impact Study (currently named Traffic Impact Study) to assess the impacts of new development projects on existing and planned streets for projects meeting one or more of the following criteria, unless it is

determined by the City Traffic Engineer that the project site and surrounding area already has appropriate multi-modal infrastructure improvements.

B) Transportation impact criteria are tiered based on a project s location within the City s Sphere of Influence. This is to assist with areas being incentivized for development. The four zones, as defined on Figure MT-4, are listed below. The following criteria apply:

A) Traffic Impact Zone II (TIZ-II): TIZ-II generally represents areas of the City currently built up and wanting to encourage infill development. Maintain a peak hour LOS standard of E or better for all intersections and roadway segments. A TIS will be required for all development projected to generate 200 or more peak hour new vehicle trips.

B1-13 cont.

Although LOS analysis is not required to determine Transportation impacts, it is fully required to determine compliance with the General Plan. This contributes Land Use and Planning impacts. As noted above, the EIR and Transportation Appendix concludes the project will result in LOS F during the PM peak hour at Intersection 1 - Marks Avenue/Belmont Avenue in cumulative year 2035. The EIR is not adequate as an informational document because it has not analyzed compliance with these policies. The EIR must be revised with this information for analysis in order to provide an adequate and accurate environmental document.

Also, the EIR does not provide a detailed site plan, floor plan, grading plan, or elevations for public review to determine conformance with the City's development standards and requirements, including the maximum permitted floor area ratio. An EIR must be prepared with these application items in order to provide an adequate and accurate environmental analysis, including consistency with the City's development standards and requirements.

B1-14

Additionally, the EIR/Initial Study has not provided any consistency analysis with Fresno COG's 2022 RTP/SCS. Due to errors in modeling and modeling without supporting evidence as noted in this comment letter, the proposed project has signifiant potential for inconsistency with Goal 2: Vibrant communities that are accessible by sustainable transportation options, Policy 4: Encourage alternatives to single-occupancy vehicles that reduce vehicle miles traveled (VMT) and greenhouse gas emissions, and Policy 6: Encourage sustainable development that focuses growth near activity centers and mobility options that achieve greater location efficiency. The project site is also identified as an Environmental Justice area[16] in the Fresno Council of Governments 2022 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS)[17]. A revised EIR

B1-15

[16] Environmental Justice Chapter of 2022 Fresno COG RTP/SCS

[17] 2022 Fresno COG RTP/SCS https://www.fresnocog.org/project/regional-transportation-plan-rtp/

must be prepared to include revised Air Quality/HRA, Energy, GHG, and VMT modeling in order to accurately analyze potential consistency or inconsistency with the 2022 RTP/SCS document. B1-15 cont.

Population and Housing

The EIR/Initial Study utilizes uncertain language and does not provide any meaningful analysis or supporting evidence to substantiate the conclusion that there will be no significant impacts to population and housing. The EIR/Initial Study does not provide a calculation of jobs created by the project during construction or operations. It also does not provide information regarding the location of qualified workers to fill the construction and operational jobs.

In order to comply with CEQA s requirements for meaningful disclosure, the EIR must be revised to provide an accurate estimate of employees generated by construction and operations of the project. It must also provide demographic and geographic information on the location of qualified workers to fill these positions. Additionally, an estimate of the number of workers relocating to the City as a result of the project should be provided utilizing existing housing vacancy rates in the City and the projected City unemployment rate at the time of project year opening. Department of Finance population estimates should also be used to determine whether the project in addition to all projects in the pipeline/under construction will exceed Fresno COG RTP/SCS projections and City projections for employment and residents within the City. A revised EIR must also include information and analysis regarding the number of construction jobs generated by the project and their potential to relocate to the City. A revised EIR must also provide a cumulative analysis of projects approved since 2020 and projects "in the pipeline" to provide an adequate and accurate analysis to determine if the project will exceed Fresno COG's employment and population growth forecasts, and all projects approved since 2014 and projects in the pipeline" to provide an adequate and accurate analysis to determine if the project will exceed the City's General Plan employment and population growth forecasts. B1-16

Notably, the VMT Analysis within the Transportation Appendix states that the project will have 4,920 employees. However, the methodology that resulted in the calculation of 4,920 operational employees is not included for review by the public. A revised EIR must be prepared to include this information for review and analysis in order to comply with CEQA's requirements for meaningful disclosure.

Conclusion

For the foregoing reasons, GSEJA believes the EIR is flawed and a revised EIR must be prepared for the proposed project and circulated for public review. Golden State Environmental Justice Alliance requests to be added to the public interest list regarding any subsequent environmental documents, public notices, public hearings, and notices of determination for this project. Send all B1-17

LETTER B1
Blum, Collins & Ho LLP
Gary Ho
May 15, 2023

Response B1-1: This introductory comment is noted. More specific comments provided in this letter are further responded to below.

Response B1-2: This comment provides a brief project description and does not contain any substantive comments or questions about the environmental analysis or conclusions contained in the Recirculated Draft EIR. Therefore, no further response is necessary.

Response B1-3: This comment states that that the Recirculated Draft EIR's Project Description does not include a detailed site plan, floor plan, grading plan, or elevations for the proposed project. Further, this comment asserts that the figure provided in Figure 3-5: Site Plan has been edited for public review to remove any and all site-specific information. Further, the comment asserts that the elevations would provide information regarding building height that is utilized for aesthetics analysis and compliance with the Fresno County ALUCP.

Section 15124 of the CEQA Guidelines states that the description of the project shall contain the following information but should not supply extensive detail beyond that needed for evaluation and review of the environmental impact:

(a) The precise location and boundaries of the proposed project shown on a detailed map, preferably topographic. The location of the project shall also appear on a regional map.

(b) A statement of the objectives sought by the proposed project. A clearly written statement of objectives will help the lead agency develop a reasonable range of alternatives to evaluate in the EIR and will aid the decision makers in preparing findings or a statement of overriding considerations, if necessary. The statement of objectives should include the underlying purpose of the project and may discuss the project benefits.

(c) A general description of the project's technical, economic, and environmental characteristics, considering the principal engineering proposals, if any, and supporting public service facilities.

(d) A statement briefly describing the intended uses of the EIR, including: a list of the agencies that are expected to use the EIR in their decision making; a list of permits and other approvals required to implement the project; and a list of related environmental review and consultation

> requirements of federal, State, or local laws, regulations, or policies. To the fullest extent possible, the lead agency should integrate CEQA review with these related environmental review and consultation requirements and decisions subject to CEQA should be listed, preferably in the order in which they will occur.

Chapter 3.0, Project Description, of the Recirculated Draft EIR is consistent with these requirements and describes the characteristics of the proposed project. Figure 3-1 shows the project site's regional and local context and Figure 3-2 shows the project site and surrounding land uses, consistent with the requirements of Section 15124(a). In addition, the proposed project's objectives are listed in Section 3.2, Project Objectives, consistent with the requirements of Section 15124(b). A description of the proposed project is included in Section 3.3, Project Description, consistent with the requirements of Section 15124(c). In addition, the list of agencies and potential permits and approvals that may be required is included in Section 3.4, Approvals/Permits, consistent with the requirements of Section 15124(d). As such, the Project Description is consistent with CEQA requirements. In addition, the Notice of Availability for the Recirculated Draft EIR stated that all documents related to the project were availability for public review at the lead agency.

As identified on page 3-18 of the Recirculated Draft EIR, the proposed project would not require any soil import or export. The project site is relatively flat; therefore, soil would be balanced on site without any requirement for soil import or export.

In addition, as described on page 3-13 of the Recirculated Draft EIR, the buildings' exterior would be up to 44 feet high, with an interior height of up to 36 feet, and designed with a total of 201 loading dock doors on the north and south sides of the buildings. Further, the building height is identified on page 4.2-5 of the Recirculated Draft EIR and is evaluated in the aesthetics analysis. In addition, the project's parking is described in Section 3.3.1 of the Recirculated Draft EIR.

In addition, as discussed in the Recirculated Draft EIR, the proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. Detailed floor plans and elevations would not provide additional details that would aid in evaluating impacts to aesthetics analysis or compliance with the Fresno County ALUCP as the proposed heights and massing of the buildings are known and were considered in the Recirculated Draft EIR analysis.

Response B1-4: This comment asserts that the Recirculated Draft EIR does not include for analysis relevant environmental justice issues in reviewing potential impacts, including cumulative impacts such as air pollution. This comment also claims

that the census tract (6019000700) ranks in the 100th percentile, indicating that it is among the most polluted census tracts in the State. This comment also states that the surrounding community, including residences adjacent to the south and adjacent SB 535 census tracts, bears the impact of multiple sources of pollution and is more polluted than average on several pollution indicators measured by CalEnviroScreen.

As identified on pages 4.2-10 and 4.2-11 of the Recirculated Draft EIR, the OEHHA, on behalf of the California Environmental Protection Agency (CalEPA), released Version 4.0 of CalEnviroScreen in October 2021. CalEnviroScreen identifies California communities by census tract that are disproportionately burdened by, and vulnerable to, multiple sources of pollution. Pollution burden scores for each census tract are derived from the average percentiles of the seven Exposures indicators (ozone and $PM_{2.5}$ concentrations, DPM emissions, drinking water contaminants, pesticide use, toxic releases from facilities, and traffic density) and the five Environmental Effects indicators (cleanup sites, impaired water bodies, groundwater threats, hazardous waste facilities and generators, and solid waste sites and facilities). According to the CalEnviroScreen 4.0 Map,[1] the project site has a pollution burden percentile of 97. Surrounding areas have pollution burdens ranging from 56 to 100.0. In addition, according to the SB 535 Disadvantaged Communities Map,[2] the project area is designated as an SB 535 disadvantaged community.

In addition, as described on page 4.2-26 of the Recirculated Draft EIR, the San Joaquin Valley Air Basin (SJVAB) is designated as non-attainment for ozone and $PM_{2.5}$ for federal standards and non-attainment for ozone, PM_{10}, and $PM_{2.5}$ for State standards. The SJVAPCD's non-attainment status is attributed to the region's development history. Past, present, and future development projects contribute to the region's adverse air quality impacts on a cumulative basis. By its very nature, air pollution is largely a cumulative impact. No single project is sufficient in size to, by itself, result in non-attainment of ambient air quality standards. Instead, a project's individual emissions contribute to existing cumulatively significant adverse air quality impacts. If a project's contribution to the cumulative impact is considerable, then the project's impact on air quality would be considered significant. In developing thresholds of significance for air pollutants, the SJVAPCD considered the emission levels for which a project's individual emissions would be cumulatively considerable. If a project exceeds the identified SJVAPCD significance thresholds, its emissions would be cumulatively

1 Office of Environmental Health Hazard Assessment (OEHHA). 2021. *CalEnviroScreen 4.0.* Website: https://oehha.ca.gov/calenviroscreen/report/calenviroscreen-40 (accessed May 2021).

2 OEHHA. 2022. *SB 535 Disadvantaged Communities using CalEnviroScreen 4.0 results.* Website: https://experience.arcgis.com/experience/1c21c53da8de48f1b946f3402fbae55c/page/SB-535-Disadvantaged-Communities/.pdf (accessed October 2022).

considerable, resulting in significant adverse air quality impacts to the region's existing air quality conditions. As shown in Tables 4.2-G and 4.2-H of the Recirculated Draft EIR, the proposed project would generate construction and operational emissions that are below the SJVAPCD's thresholds. As such, the proposed project would not result in a cumulative air quality impact and additional analysis to assess cumulative impacts is not required.

Although the project site has a pollution burden percentile of 97, is designated as an SB 535 disadvantaged community, and is considered a diverse community, there is no methodology to quantify the cumulative areawide or localized health risks within a community-wide area. The SJVAPCD's recommended thresholds of significance apply to individual development projects and evaluate the incremental increase in emissions from a proposed source. In developing thresholds of significance for individual projects, the SJVAPCD considered the emission levels for which a project's individual emissions would be cumulatively considerable. The City relies on the SJVAPCD's recommended methodology to evaluate cumulative impacts, which is to conclude that an impact considered to be significant on a project-specific basis would also cause a significant cumulative impact.

Response B1-5: This comment states that the census tract ranks in the 94th percentile for hazardous waste impacts, in the 84th percentile for contaminated drinking water, in the 45th percentile for groundwater threats, and in the 78th percentile for solid waste facility impacts.

Although the project's census tract ranks in the 94th percentile for hazardous waste impacts, impacts related to hazardous waste are addressed in Section 4.7, Hazards and Hazardous Materials, of the Recirculated Draft EIR. As described in Section 4.7, Hazards and Hazardous Materials, a Phase I Environmental Site Assessment (ESA) was conducted for the project site by SALEM Engineering Group, Inc. (SALEM) on January 29, 2021, and a Phase II ESA was conducted for the project site by SALEM on February 3, 2021. The Phase I ESA identified evidence of Recognized Environmental Conditions (RECs) and one Historical Recognized Environmental Condition (HREC). The Phase II ESA was performed to address the RECs and HREC identified in the Phase I ESA, to gather data regarding current site conditions, to establish baseline soil and soil vapor concentrations, and to evaluate if soil vapor conditions pose a potential vapor intrusion risk to future occupants at the project site. Based on the results of the Phase II ESA, it was determined that no additional assessment activities are required. The Phase II ESA determined that the project site is suitable for unrestricted use and no engineering controls (i.e., VOC vapor barrier) are required. In the event the project site would undergo any redevelopment that would include soil disturbance, the Phase II ESA recommended that a Soil Management Plan (SMP) be prepared to address soil management procedures that may arise based on historical

use of the project site and total petroleum hydrocarbons (TPH) and arsenic, which was required by Mitigation Measure HAZ-1. Implementation of Mitigation Measure HAZ-1, which would require preparation of an SMP, would effectively mitigate any impacts related to a significant hazard to the public or the environment to less than significant levels.

In addition, although the census tract also ranks in the 84th percentile for contaminated drinking water, the 45th percentile for groundwater threats, and the 78th percentile for solid waste facility impacts, as described in Section 4.8, Hydrology and Water Quality, and Section 4.11, Utilities and Service Systems, of the Recirculated Draft EIR, the proposed project would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality, and would comply with federal, State, and local statutes and regulations related to solid waste. As such, the proposed project would not contribute to significant cumulative water quality or solid waste facility impacts.

Response B1-6: This comment states that this census tract is a diverse community with a high rate of low educational attainment and a high rate of poverty, which can affect health when people cannot afford healthy living and working conditions, nutritious food, and necessary medical care. This comment also states that poor communities are often located in areas with high levels of pollution and that poverty is also an indication that residents may lack health insurance or access to medical care. Further, this comment states that the project census tract is identified as SB 535 Disadvantaged Communities and that the Recirculated Draft EIR must include an analysis of impacts on the disadvantaged communities.

See Response B1-4. Although the project site is designated as an SB 535 disadvantaged community and is considered a diverse community, there is no methodology to quantify the cumulative areawide or localized health risks within a community-wide area. The SJVAPCD's recommended thresholds of significance apply to individual development projects and evaluate the incremental increase in emissions from a proposed source. These thresholds do not apply to cumulative projects. The City relies on the SJVAPCD's recommended methodology to evaluate cumulative impacts, which is to conclude that an impact considered to be significant on a project-specific basis would also cause a significant cumulative impact.

Response B1-7: This comment claims that California's Building Energy Code Compliance Software (CBECC) is the State's only approved energy compliance modeling software for non-residential buildings, in compliance with Title 24, and that CalEEMod is not the approved software.

As described in the SJVAPCD's GAMAQI,[1] when quantifying project emissions, the latest approved models by the SJVAPCD should always be used for air quality analysis. The latest approved model available is CalEEMod, which is a statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and greenhouse gas (GHG) emissions associated with both construction and operations from a variety of land use projects. The model quantifies direct emissions from construction and operations (including vehicle use), as well as indirect emissions, such as GHG emissions from energy use, solid waste disposal, vegetation planting and/or removal, and water use.[2] The commenter asserts the use of CalEEMod to estimate the project's energy demand was inappropriate and that CBECC should have been used instead. The compliance modeling software that is referenced by the commenter is used to confirm the final design of a development project and complies with applicable energy efficiency regulations based on detailed information included in construction drawings. As such, the purpose of the CBECC model is to evaluate compliance with the 2022 Title 24 standards, not to evaluate potential energy impacts under CEQA.

The information needed to demonstrate compliance with Title 24 using the CBECC model is not available at this time and is not typically prepared until after a project has been approved/entitled. After approval and preparation of detailed building plans, the project would be required to demonstrate compliance with Title 24 using the CBECC model. As described in the CalEEMod User's Guide, CalEEMod utilizes widely accepted methodologies for estimating emissions combined with default data that can be used when site-specific information is not available. [3,4] Sources of these methodologies and default data include, but are not limited to, the USEPA AP-42 emission factors, CARB vehicle emission models, and studies commissioned by California agencies such as the CEC and CalRecycle. The User's Guide also states that CalEEMod calculates construction and operations emissions from land use development projects which can be used to support preparation of air quality and GHG analyses in CEQA documents, including EIRs. In addition, the User's Guide states that the emissions inventory modules also contain default values for estimating utility consumption (e.g., water, electricity,

1 San Joaquin Air Pollution Control District. 2015. *Guidance for Assessing and Mitigating Air Quality Impacts (GAMAQI)*. March 19. Website: http://www.valleyair.org/transportation/GAMAQI.pdf (accessed May 2023).

2 Ibid.

3 California Air Pollution Control Officers Association. 2021. *California Emissions Estimator Model User's Guide.* May. Website: http://www.aqmd.gov/docs/default-source/caleemod/user-guide-2021/01_user-39-s-guide2020-4-0.pdf?sfvrsn=6 (accessed May 2023).

4 Detailed information regarding CalEEMod default assumptions can be found in the User's Guide: http://www.aqmd.gov/caleemod/user's-guide.

natural gas) that may be useful for preparing hydrology and energy analyses in other sections of a CEQA document. Additionally, it should also be noted that the energy use factors included in the CalEEMod model, which was used to estimate energy for the project, are based on the CEC-sponsored California Commercial End Use Survey (CEUS) and Residential Appliance Saturation Survey (RASS) studies, which provide a more conservative assumption based on actual use surveys and are the best available information for purposes of this assessment. As such, CalEEMod is appropriate for use in energy analyses. Further, as discussed in Chapter 3.0, Project Description, of the Recirculated Draft EIR, the proposed project would comply with the latest CALGreen building measures and 2022 Title 24 Standards. Therefore, use of the CBECC model would not change the findings identified in the Recirculated Draft EIR.

Response B1-8: This comment states that the City's General Plan has not been updated to be consistent with the Fresno County ALUCP Updates to the December 3, 2018 plan (amended December 2021). As such, this comment asserts that ALUC review of the revised General Plan would be required to ensure consistency with the ALUCP. Therefore, ALUC review of the proposed project is required pursuant to Public Utilities Code Section 21676.5(a), and the Recirculated Draft EIR must be revised to include this information for analysis and include a finding of significance because the review has not occurred. In addition, this comment asserts that the Recirculated Draft EIR must include a calculation of the project's maximum intensity of people per acre in order to accurately and adequately analyze the potentially significant impacts.

The ALUC has reviewed the proposed project and has provided comments. As discussed in Response A2-3, based on the Fresno County ALUCP safety requirements, in zone 4, the maximum non-residential intensity is 150 persons per acre, and in zone 6, the maximum non-residential intensity is 300 persons per acre. As identified in Chapter 3.0, Project Description, of the Recirculated Draft EIR, the project site is 48.03 acres. Therefore, the maximum non-residential intensity would be between 7,204 and 14,409 persons. As discussed in the Recirculated Draft EIR, the proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. As such, at this time, the specific number of employees is not yet known. However, given that the project site would primarily be used for warehouse uses, it is not expected that the proposed project would generate more than 7,204 employees.

Further, as discussed in Response A2-6 and as discussed in Section 3.3.2, Open Space and Landscaping, of the Recirculated Draft EIR, consistent with City requirements, landscaping would be provided throughout the project site. The project would also include a vegetative plan that includes the planning of trees and other landscaping materials throughout the perimeter

of the project site. As such, the vegetative plan would be consistent with the 10–20 percent open land requirement of the airport safety zones.

In addition, the proposed project would not include any structures higher than 70 feet, hazardous uses, hazards to flight, or prohibited land uses. In addition, the proposed project would not include any structures that would penetrate 14 Code of Federal Regulations (CFR) Part 77 surfaces. Therefore, revisions to the Recirculated Draft EIR are not required.

Response B1-9: This comment asserts that the Recirculated Draft EIR does not demonstrate compliance with General Plan policies related to traffic and traffic studies (MT-1-n Peak Hour Vehicle LOS and MT-2-i Transportation Impact Studies) and is not adequate as an informational document because it has not analyzed compliance with these policies.

As discussed on pages 4.10-7 and 4.10-8 of the Recirculated Draft EIR, level of service (LOS) analysis is no longer a criterion of significance for traffic impacts under CEQA. Threshold 4.10.1 used in the analysis is consistent with Appendix G of the *State CEQA Guidelines,* which states that the proposed project would result in a significant impact related to transportation if it would conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities. The City of Fresno General Plan includes policies that utilize LOS to determine project conditions of approval. As such, the Recirculated Draft EIR evaluates LOS impacts on pages 4.10-7 through 4.10-11 and in the TIS (Appendix M of the Recirculated Draft EIR).

General Plan Policy MT-1-n requires the City to maintain a peak-hour vehicle LOS standard of D or better for all roadway areas outside of identified Activity Center and Bus Rapid Transit Corridor districts, unless the City Traffic Engineer determines that mitigation to maintain this LOS would be infeasible and/or conflict with the achievement of other General Plan policies. General Plan Policy MT-2-i requires a TIS to assess the impacts of new development projects on existing and planned streets, unless it is determined by the City Traffic Engineer that the project site and surrounding area already has appropriate multi-modal infrastructure improvements. The commenter is incorrect that the Recirculated Draft EIR does not demonstrate compliance with these policies because a TIS was prepared for the proposed project and evaluates LOS.

As discussed on page 4.10-10 of the Recirculated Draft EIR, the intersection of Marks Avenue/Belmont Avenue is currently operating at a deficient LOS and will worsen with time. This intersection meets several signal warrants under the Existing, Existing with Project, Near-Term Approved and Pending with Project, Cumulative Year (2035) without Project, and Cumulative Year (2035) with Project scenarios. As discussed in the Recirculated Draft EIR, the

project adds to the existing and forecasted deficiency at this location. The City, however, has already earmarked this location for installing a signal and has a funding mechanism in place (the City's Traffic Signal Mitigation Impact [TSMI] fee program). As discussed in the Recirculated Draft EIR, this intersection is forecast to operate at a satisfactory LOS with the implementation of the proposed improvement, and impacts to intersection LOS would be less than significant with implementation of the signal. Therefore, the commenter is incorrect in stating that the Recirculated Draft EIR is not adequate as an informational document because it has not analyzed compliance with City's General Plan policies.

For the reasons described above, this comment does not identify any new significant environmental issues or impacts that were not already addressed in the Recirculated Draft EIR. Neither this comment nor the response constitutes new information requiring recirculation of the Recirculated Draft EIR.

Response B1-10: This comment asserts that the Recirculated Draft EIR has not correctly addressed VMT consistent with the significance threshold and legislative intent of SB 743 to reduce GHG emissions by reducing VMT.

As described on pages 4.10-12 through 4.10-14 of the Recirculated Draft EIR, the Fresno Council of Governments' (Fresno COG) Activity-Based Model (ABM) was used to estimate the project's VMT and VMT metric. ABM is a tour-based model that captures travel behavior of the region comprehensively. As such, the project employee VMT included VMT from all employee tours and sub-tours, which include employee commute tours, project-related delivery tours within the region, and any other tours related to the project. In addition, the project VMT and the VMT metric used for this analysis are consistent with the City's and Fresno COG's adopted methodology/guidelines for preparation of VMT analysis. The guidelines provide substantial evidence demonstrating the appropriateness of the VMT analysis methodology, consistent with the intended goals for SB 743. Truck trips were not included in the VMT analysis, consistent with CEQA Guidelines Section 15064.3, subdivision (a), which states "For the purposes of this section, 'vehicle miles traveled' refers to the amount and distance of automobile travel attributable to a project." The technical guidance from the Office of Planning and Research (OPR) does say that heavy-duty truck VMT "*could be included*"; however, the Guidance goes on to state that this would be for modeling convenience and ease of calculation. Heavy-duty trucks are not included in the CEQA guidelines for VMT analysis, are not included in the Fresno COG model, and therefore were not included in the VMT analysis. "An agency's use of a reasonable standard for gauging the significance of an impact may not be set aside on the ground the impact would have been found significant if other recognized standards had instead been used." (Kostka, §

6.45, p. 6-50/50; see *Jensen*, *supra*, 23 Cal.App.5th at 887; *Citizens for Responsible Equitable Environmental Development*, *supra*, 197 Cal.App.4th at 336–336.) Therefore, the project's analysis of VMT is consistent with the significance threshold and legislative intent of SB 743, and additional analysis is not required.

For the reasons described above, this comment does not identify any new significant environmental issues or impacts that were not already addressed in the Recirculated Draft EIR. Neither this comment nor the response constitutes new information requiring recirculation of the Recirculated Draft EIR.

Response B1-11: This comment claims that the Recirculated Draft EIR has not adequately analyzed the project's potential to substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses, or the project's potential to result in inadequate emergency access.

As described on pages 4.10-14 and 4.10-15 of the Recirculated Draft EIR, the project site plan does not add any sharp curves or hazardous geometric features. As shown on Figure 3-5, Site Plan, of the Recirculated Draft EIR, all internal roadways within the project are 40 feet wide. These internal roadways are perpendicularly connected to each other, avoiding any sharp curves, hazardous geometric feature, or any requirement for sharp maneuvers. Further, as shown on the site plan, within the project site, there are multiple areas for vehicles (both cars and trucks) turning or backing up to avoid any conflicting movements, if required. Additionally, as shown on the site plan, with the docking and parking areas, truck maneuvering spaces are a minimum of 185 feet wide, which is wide enough for safe maneuvering of large semitrailer trucks. All these measurements shown on the site plan demonstrate that the project does not create any hazardous design.

As identified on page 3-5 of the Recirculated Draft EIR, the project site is surrounded by low-density residential, light and heavy industrial, and cemetery uses, as well as vacant, undeveloped land. As the proposed project is located near existing light and heavy industrial uses, truck-intensive uses are currently present in the project site vicinity. Trucks access these sites using the intersections and driveways along Marks Avenue, Nielsen Avenue, and Hughes Avenue. The project is not anticipated to be accessed by any vehicle larger than the existing trucks using the circulation network along the project frontages.

As shown on the project site plan, the project would have seven driveways along Marks Avenue, Nielsen Avenue, and Hughes Avenue. Trucks would access the project site using the central driveway along Marks Avenue or the other project driveways along Nielsen Avenue and Hughes Avenue designed

for truck access. All of these driveways have been designed in accordance with the City's standard for driveways to be utilized by truck traffic. The site plan, including the project driveway designs, has been reviewed and confirmed to maintain the City's design standard for truck access during the planning process. As such, all project truck traffic would have adequate maneuvering and turning spaces in and along the project frontages, including at the project driveways.

Further, as discussed on page 4.10-15, due to the presence of multiple driveways along all three project frontages, emergency vehicles have adequate alternatives to access the project, if required. Additionally, the proposed project's site plan would be subject to review and approval by the Fresno Fire Department (FFD) to ensure the project includes adequate emergency access. Improvements identified in the TSMI fee program would provide for an enhanced roadway network that accommodates forecasted travel demand and would provide adequate emergency access in the project vicinity. As such, the proposed project would not physically interfere with emergency evacuation or FFD access to and from the project site, and a less than significant impact would occur.

For the reasons described above, this comment does not identify any new significant environmental issues or impacts that were not already addressed in the Recirculated Draft EIR. Neither this comment nor the response constitutes new information requiring recirculation of the Recirculated Draft EIR.

Response B1-12: This comment asserts that a reasonable range of alternatives was not included in the Recirculated Draft EIR.

As discussed on page 5-1 of the Recirculated Draft EIR, an accordance with CEQA and the CEQA Guidelines (Section 15126.6), an EIR must describe a range of reasonable alternatives to the project, or to the location of the project, that would "feasibly attain most of the project's basic objectives, while avoiding or substantially lessening any of the significantly adverse environmental effects of the project." An EIR does not need to consider every conceivable alternative to a project; rather, it must consider a reasonable range of potentially feasible alternatives that will foster informed decision-making and public participation. The range of alternatives required in an EIR is governed by a "rule of reason."

Furthermore, as discussed on page 5-3 of the Recirculated Draft EIR, *State CEQA Guidelines* Section 15126.6I requires an EIR to identify and briefly discuss any alternatives that were considered by the lead agency but rejected as infeasible during the scoping process. The City considered certain alternatives during the preparation of this EIR and found them to be infeasible. Section 5.3 of the Recirculated Draft EIR provides a description of

potential alternatives that were identified and considered by the City and the reasons why they were ultimately not selected for further evaluation in the Recirculated Draft EIR. In dismissing these alternatives from detailed evaluation in the Recirculated Draft EIR, primary considerations were whether the alternatives would meet *most* of the project's basic objectives, whether the alternatives were *feasible*, and whether they would substantially *reduce the significant impacts* of the proposed project. As described in Section 5.3, an alternative that would develop residential uses on the project site was considered but dismissed from detailed evaluation because such an alternative would not achieve three of the four objectives of the proposed project. Further, residential uses on the project site would not be consistent with the project site's General Plan land use designation of Heavy Industrial (IH) and zoning designation of Heavy Industrial District (IH). In addition, as described in Section 5.3, other parcels in the Fresno area could be suitable for the development of industrial warehouse uses comparable to the proposed project. However, similar to the proposed project, the development on other sites would still have the potential to result in significant impacts on air quality, biological, cultural, and hazards and would require the same or comparable mitigation measures. Further, there would be similarly significant aesthetics and noise impacts. As this alternative would not reduce or avoid the project's significant impacts, and because the applicant does not own the site or can reasonably acquire it, this alternative was not carried forth for detailed evaluation.

Response B1-13: This comment incorrectly states that the Recirculated Draft EIR does not provide a consistency analysis with all applicable Fresno General Plan goals and policies, including policies MT-1-n, Peak Hour Vehicle LOS, and MT-2-I, Transportation Impact Studies. This comment asserts that although LOS analysis is not required to determine transportation impacts, it is fully required to determine compliance with the General Plan.

Refer to Response B1-9, above. As discussed on pages 4.10-7 and 4.10-8 of the Recirculated Draft EIR, LOS analysis is no longer a criterion of significance for traffic impacts under CEQA. Threshold 4.10.1 used in the analysis is consistent with Appendix G of the *State CEQA Guidelines,* which states that the proposed project would result in a significant impact related to transportation if it would conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities. The City of Fresno General Plan includes policies that utilize LOS to determine project conditions of approval. As such, the Recirculated Draft EIR evaluates LOS impacts on pages 4.10-7 through 4.10-11 and in the TIS (Appendix M of the Recirculated Draft EIR).

Response B1-14: This comment states that the Recirculated Draft EIR does not provide a detailed site plan, floor plan, grading plan, or elevations for public review to

determine conformance with the City's development standards and requirements, including the maximum permitted floor area ratio (FAR).

As described in Response B1-3, above, the proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. Further, as discussed in Response B3-1, the information contained in Chapter 3.0, Project Description, of the Recirculated Draft EIR is consistent with the requirements of Section 15124 of the CEQA Guidelines. In addition, the Notice of Availability for the Recirculated Draft EIR stated that all documents related to the project were availability for public review at the lead agency. Detailed site plans, floor plans, grading plans, and elevations would not provide additional details that would aid in evaluating impacts to conformance with the maximum permitted FAR as the overall square footage and siting of the buildings were known and were considered in the Recirculated Draft EIR analysis. Further, the City is reviewing the proposed project to determine conformance with the City's development standards and requirements, including the maximum permitted FAR.

Response B1-15: This comment states that the Recirculated Draft EIR has not provided any consistency analysis with the Fresno COG's 2022 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and that the proposed project has significant potential for inconsistency with Goal 2: Vibrant communities that are accessible by sustainable transportation options; Policy 4: Encourage alternatives to single-occupancy vehicles that reduce vehicle miles traveled (VMT) and GHG emissions; and Policy 6: Encourage sustainable development that focuses growth near activity centers and mobility options that achieve greater location efficiency. This comment also states that the project site is also identified as an environmental justice area in the Fresno COG's 2022 RTP/SCS.

As demonstrated on page 4.10-14 of the Recirculated Draft EIR, the project would result in a less than significant VMT impact concerning consistency with CEQA Guidelines Section 15064.3(b). In addition, consistent with the City's General Plan policies, the project would implement multi-modal improvements along the project frontage, including the addition of sidewalks all along the project frontage. In addition, as described in Appendix H, Greenhouse Gas Reduction Plan Update Checklist, of the Recirculated Draft EIR, the project would have over 100 employees and would be required to comply with SJVAPCD Rule 9410, which requires the implementation of trip reduction programs such as increasing transit use, carpooling, vanpooling, bicycling, or other measures to reduce VMT. As such, the commenter is incorrect that the proposed project would be inconsistent with Goal 2, Policy 4, or Policy 6 in the Fresno COG's 2022 RTP/SCS. Refer to Responses B1-4, B1-5, and B1-6 for a discussion of impacts related to environmental justice. The

project site is consistent with the Heavy Industrial General Plan land use designation and is located in a primarily industrial area; therefore, the proposed project would be compatible with the surrounding uses and would not be inconsistent with the Fresno COG's 2022 RTP/SCS.

Response B1-16: This comment states that the Recirculated Draft EIR utilizes uncertain language and does not provide any meaningful analysis or supporting evidence to substantiate the conclusion that there will be no significant impacts to population and housing. The comment also states that the EIR/Initial Study does not provide a calculation of jobs created by the project during construction or operations and that it does not provide information regarding the location of qualified workers to fill the construction and operational jobs.

As discussed in the Recirculated Draft EIR, the proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. The TIS (Appendix M of the Recirculated Draft EIR) estimated approximately 4,920 employees for purposes of the VMT analysis. As discussed on page 96 of the TIS, the employment was calculated based on a building square footage to employee conversion factor in the ITE Trip Generation Manual, 10th Edition. Daily trip rates per employee were divided by daily trip rates per 1,000 square feet to estimate the ratio between land use square footage and number of employees. However, this employment calculation was only used for the purposes of the VMT analysis. In addition, based on CalEnviroScreen, the project's census tract is in the 97th percentile for unemployment. Since the proposed project is located in an area with high unemployment, it is expected that there would be an available pool of employees to fill future employment positions at the project site. As discussed in the Initial Study, included as Appendix B of the Recirculated Draft EIR, the proposed project would not result in direct population growth as the use proposed is not residential and would not contribute to permanent residency on-site. Further, the site is designated Heavy Industrial by the General Plan and would not generate growth beyond that anticipated in the General Plan. Therefore, the proposed project would not induce substantial unplanned population growth in an area, either directly or indirectly.

Response B1-17: This comment states that the City must prepare a revised EIR for the proposed project and is noted. For the reasons explained in the responses above, the Recirculated Draft EIR properly evaluated the proposed project's potential impacts, and the commenter has not presented substantial evidence to the contrary. Therefore, a revised EIR is not required.

Comment Letter B2

Advocates for the Environment

A non-profit public-interest law firm
and environmental advocacy organization

Steven Martinez
Planner
City of Fresno
2600 Fresno Street, Room 3043
Fresno CA, 93721

Via U.S. Mail and email to Steven.Martinez@fresno.gov

re: Comments on the Draft Environmental Impact Report on 2740 West Nielsen Avenue Office/Warehouse Project, SCH No. 2022050265

Dear Mr. Martinez:

Advocates for the Environment submits the comments in this letter regarding the Recirculated Draft Environmental Impact Report (**RDEIR**) for the 2740 West Nielsen Avenue Office/Warehouse Project (**Project**) located at 2740 West Nielsen Avenue, on the north side of West Nielsen Avenue between North Marks and North Hughes Avenues in the City and County of Fresno, California. The Project proposes to construct four concrete tilt-up office/warehouse buildings for heavy industrial uses with a total gross floor area of 901,438 square feet on a 48.03-acre lot. There would be a total of 594 on-site parking spaces.

The comments below are based on the concern that the RDEIR violates CEQA. Advocates for the Environment is a public interest law firm and advocacy organization with the mission to educate the public about the law as it pertains to the environment and provide legal services in support of environmental causes. It is within the scope of Advocates for the Environment's mission to provide comments on the development of this project, especially because the RDEIR reflects potential issues of non-compliance with CEQA. Advocates for the Environment has reviewed the RDEIR released in February 2023 and provides its comments below on the sufficiency of the RDEIR's greenhouse gas (**GHG**) analysis.

B2-1

GHG Significance Analysis

The RDEIR incorporated three significance thresholds for GHG emissions that will be discussed below. For all three thresholds, there was a conclusion of "less than significant" impact, and that no mitigation is required to reach this level of significance. (RDEIR 4.6-20-26). However, this conclusion is not supported by substantial evidence. In reality, the Project is likely to have a significant impact on GHG emissions that should be analyzed and mitigated appropriately according to the Project's fair share of cumulative emissions.

B2-2

10211 Sunland Blvd., Shadow Hills, CA 91040 (818) 650-0030 X101 dw@aenv.org

The RDEIR concludes that this proposed Project would have a less than significant impact. However, evidence in the record before the City indicates that the Project is inconsistent with applicable plans and policies designed to reduce greenhouse gas (**GHG**), and failed to fall within the adopted significance thresholds, and is therefore likely to have a significant environmental impact due to high levels of GHG emissions. B2-3

Threshold 4.6.1 – Direct or Indirect Significant Impact

The first significance threshold adopted by the RDEIR is Threshold 4.6.1: "the project would not generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment." (RDEIR 4.6-20). The Project estimated annual construction emissions at approximately 1,961.0 Metric Tons Carbon Dioxide Equivalent (**MTCO2e**) per year, with total operational emissions of approximately 4,967 MTCO2e annually. GHG emissions were calculated using CalEEMod. The RDEIR states that "if a project is consistent with an adopted qualified Greenhouse Gas Reduction Strategy that meets the standards, it can be presumed that the project would not have significant GHG emission impacts." (RDEIR, p. 4.6-22.) The City claims that the RDEIR qualifies, based on consistency with the Fresno Reduction Plan Update (**RPU**), as determined by compliance with the Consistency Checklist (**Checklist**). (RDEIR, p. 4.6-23).

The City concluded that the Project meets all the Checklist requirements, does not conflict with the City of Fresno GHG Reduction Plan Update, and therefore results in a less than significant impact. However, the resulting significance determination on this basis is erroneous because the Project would not meet all the applicable requirements of the RPU's Consistency Checklist. In particular, the Project is not compliant with Checklist item 2:b, which requires commercial buildings to "provide EV charging spaces capable of supporting EV capable spaces at 4% to 10% of the parking space." (Appendix H). The City claims that this item is not applicable to this Project because it "would not include commercial uses." Yet, the title of the Project as an "Office/Warehouse" indicates that offices—a well-known commercial use—will be one of the primary uses. And in certain cases warehouses are also commercial. Although it may not be a commercial project on the whole due to the potential inclusion of industrial uses, the Checklist specifies that this item applies to commercial "buildings." Thus, the Project will need to demonstrate that it will install the required EV charging spaces for all of the buildings intended to be used as offices in order to be in compliance with the Checklist. B2-4

This apparent failure to meet all the applicable Checklist requirements means that the City cannot rely on the Checklist as a mechanism to rule out a determination of significant GHG impact, and results in the Project being deemed inconsistent with the entire RPU. (Appendix H). Thus, the City will need to apply a different standard for determining "direct or indirect impact" if it is to use Threshold 4.6.1 as one of the significance thresholds and cannot

claim no significant impact on this basis. Further, any project that fails to meet all of the applicable Checklist requirements must go a step further by incorporating all of the Checklist measures "to the extent feasible," which would likely go beyond the minimal requirements. B2-4 cont.

Threshold 4.6.2 - Inconsistent with Applicable Plans

The second significance threshold adopted by the RDEIR is Threshold 4.6.2: the project would not "conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases." (RDEIR, p. 4.6-23). This language requires the Project to comply with *all* applicable plans, not only the plans most favored by the City. But here the RDEIR excluded a meaningful analysis of several applicable plans while identifying and comparing plans that are no longer applicable. The RDEIR concluded the Project would have no significant GHG impact under this adopted threshold, but that conclusion is not supported by substantial evidence.

The RDEIR analyzed five applicable plans: Executive Order (**EO**) B-30-15, SB 32, AB 197, the 2017 Scoping Plan, and the 2022 Scoping Plan. The RDEIR conclusively stated that "the proposed project would comply with existing State regulations adopted to achieve the overall GHG emissions reduction goals identified in EO B-30-15, SB 32, AB 197, and would be consistent with applicable plans and programs designed to reduce GHG emissions, mainly based on the argument that the Project is consistent with the RPU. (RDEIR 4.6-25.) B2-5

For example, the RDEIR states that because the Project is consistent with the RPU, that "emissions associated with the project would not hinder the City's ability to meet the reduction targets outlined in SB 32." (RDEIR 4.6-26). However, as demonstrated above, the Project is not consistent with the RPU, so the lead agency will need to find a different basis to establish consistency with SB 32.

The RDEIR was unable to establish, with substantial evidence, that the Project is consistent with all of the identified appliable plans, policies, and regulations for the reduction of GHGs. Therefore, its conclusion that the proposed Project would have less than significant impact is not supported.

There are significant inconsistencies with the CARB 2017 Scoping Plan which the RDEIR analysis failed to address. The Scoping Plan was developed to facilitate California's compliance with SB 32, which requires statewide GHG emissions to be reduced to 40% below 1990 levels by 2030. (Health & Safety Code § 38566.) The 2017 CARB Scoping Plan sets out statewide goals for total GHG emissions targets of 6 MTCO2e/capita by 2030, and 2 MTCO2e/capita by 2050 (CARB Scoping Plan, p. 99).

From the information provided in the RDEIR, it is impossible to determine the Project's actual per capita metric, because there is no mention of the number of workers that would B2-6

comprise the Project's service population, but the average warehouse employs 182 workers.[1] Because the Project's net operational GHG emissions are estimated to be 4,967 MTCO2e/year, the Project's per-service population emissions would be about 27.29 MTCO2e/service population each operating year.[2] As this is more than four times the 2030 goal of 6 MTCO2e/capita, and the building would likely last more than seven years, there is a fair argument that this inconsistency demonstrates significant GHG impact. To the extent that the true predicted service population differs from this average, the City should update the resulting estimated per capita emissions and compare the result to the goals set out in the 2017 Scoping Plan for the Project's full lifespan.

B2-6 cont.

Further, the Project is clearly inconsistent with the 2022 Scoping Plan, which aims to achieve carbon neutrality by 2045. It is likely that this Project will be operating well into 2045, due to the long lifespan of warehouses, so the RDEIR must demonstrate consistency with the entire operation of the Project. Here, there is no showing that the Project would achieve carbon neutrality by 2045 because it anticipates using natural gas and other carbon-intensive fuels with no future plan for reduction.

The RDEIR should be updated to reflect consistency not only with the identified applicable plans, but also other applicable plans that it disregarded. Specifically, for the Project's impacts to be insignificant, the Project must be consistent with the EO B-55-18, because it is an applicable policy.

B2-7

And the RDEIR made no effort to reconcile the Project with EO B-55-18, which aims to achieve carbon neutrality by 2045. As this Project requires industrial storage and transportation using large vehicles, with no plans of reducing or offsetting emissions to zero by 2045, the City has made no demonstration of consistency with B-55-18, which is an applicable policy that the Project must demonstrate consistency with in order to conclude that the impact is less than significant.

Threshold 4.6.1 – Cumulative Impact

"Threshold 4.6.3: The proposed project, in combination with past, present, and reasonably foreseeable projects, would not contribute to a significant cumulative impact with respect to greenhouse gas emissions." There is no need for this to be analyzed in a separate significance threshold because CEQA requires that all GHG impact to be cumulative. For the reasons given above, the Project would contribute to significant cumulative GHG impact because the RDEIR has not demonstrated that the GHG impact is below the significance thresholds.

B2-8

[1] www.mmh.com/article/2018_warehouse_distribution_center_survey_labor_crunch_driving_automation
[2] 4,967 MTCO2e ÷ 182 people = 27.29 MTCO2e/service population

CalEEMod Deficiencies

Appendix C contains the CalEEMod output sheets, which show the basis for the RDEIR's GHG emissions estimates. There is no evidence for the CO_2 efficiency of 203.98 lb/MWhr, a parameter which was used for CalEEMod. Evidence demonstrates that the intensity score in reality is much higher, at about 352.45 lb/MWhr.[3] There is also no indication on the CalEEMod parameters of where the intensity score originated or otherwise was calculated from, for all intensity metrics of CO2, CH4, and NO2. The agency should amend the intensity scores for all of them as necessary and cite where the numbers are from. **B2-9**

Additionally, the CalEEMod analysis indicates a population of zero although presumably there will be some non-zero service population due to the need for employees to conduct general operations at the warehouse. The RPU Consistency Checklist indicates that the Project will employ over 100 individuals, although it does not specify how many. The agency should amend the CalEEMod population parameter to reflect the true estimated value because it could affect the Project's emissions. **B2-10**

Certain EMFAC Adjustment factors were changed to be lower than their default value, which would result in a reduction in the total CO2e estimation. But the RDEIR does not support these alterations of the default with any evidence or rationale for why they would be any different from the standard program used for modeling vehicle emissions. The result of this is an underreporting of VMT-related GHG emissions without a basis for doing so.

Lastly, certain values are reported as zero when there is evidence that it would result in emissions in reality. For example, the entry for "architectural coatings," which are paints or other products for the exterior of the building, would likely be used and release some amount of GHGs that should be accounted for in section 6.2 (Appendix H). **B2-11**

Overall, the total estimation of 4,967 MTCO2e per year appears to be an under-exaggeration which does not reflect an accurate estimation of the Project's GHG emissions.

Feasible Mitigation

No mitigation measures were considered for GHGs due to the erroneous determination of less than significant impact. The identification and analysis of mitigation is necessary because the REIR does not sufficiently demonstrate that GHG emissions would have a less than significant impact. However, because the City should have found significant impact for GHG emissions, it should update its findings accordingly and would therefore be required to mitigate to the fair share level. To do so, the RDEIR should incorporate mitigation measures to make it **B2-12**

[3] https://findenergy.com/ca/fresno-county-electricity/#fuel-types (1,002,972,444 kg * conversion factor = 2211175739.13 lbs. 2211175739.13 lbs/6,273,644 MWh = 352.4547678).

clear that the Project's effects would be sufficiently mitigated to lower GHG impact to the fair share extent.

There are many mitigation measures that can feasibly be adopted. For example, while Cal Green standards would be met, it would not follow any other green ratings. One mitigation that could be implemented is adherence to the LEED certification standard, among other green building standards. The warehouse could incorporate energy-generating features such as rooftop solar panels or sponsor local renewable energy programs. The Project could require future tenants to use electric equipment and vehicles to the extent possible, and strictly prohibit idling on the premises.

B2-12 cont.

Vehicle Miles Traveled Impact Analysis

Finally, the RDEIR identified the impact of Vehicle Miles Traveled (**VMT**) as "less than significant" without mitigation, simply based on the fact that the Project's estimated VMT per employee is lower than the regional average of 25.6 miles. (RDEIR 4.10-14). However, this conclusion cannot stand without adequately supporting the validity of chosen significance threshold.

The RDEIR recognizes that "a quantitative analysis of VMT impacts must be prepared and compared against the adopted VMT thresholds of significance." (RDEIR 4-10.13). Although the RDEIR may have technically satisfied this requirement, the conclusion it came to is not supported by substantial evidence because the adopted threshold of significance (namely, comparing the estimated VMT to the current regional average) does not have a rational basis. Specifically, the RDEIR has not demonstrated that the *current* average VMT of the region is a rational significance threshold. This logic, without more evidentiary support, is invalid because there is no reason why a current average value could not also be a "significant" VMT value; it is not mutually exclusive. Thus, this threshold relies on the inherent presumption that the current average value is necessarily less than significant without demonstrating that this is the case.

B2-13

Even if the City can demonstrate that the current average value is less than significant, it must still analyze the potential need for VMT reductions in the future and how the Project will meet the goals for the reasonable lifetime of an office/warehouse building. In all likelihood, average VMT may have to be reduced in the near future and consistently achieve reductions from the current average in order to meet local, regional, and statewide VMT goals and concomitant GHG reductions. And because the significance analysis must account for the reasonable lifetime of the Project in its entirety, the VMT analysis should likewise demonstrate that the Project will not only demonstrate a VMT impact that meets the current standard, but also will be able to achieve VMT reductions in alignment with future standards to the extent that it would create an above-significant impact during the Project's operation.

Comment Letter B2 Cont.

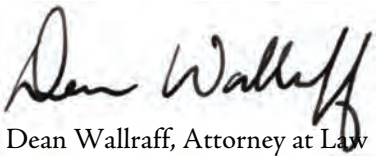
Conclusion

In conclusion, the lead agency assumed, without analyzing, that the project will comply with the measures outlined in applicable plans and policies, but clearly conflicts with those plans. And it entirely ignored several key applicable plans for GHG reductions.

B2-14

Please put Advocates for the Environment on the list of interested parties to receive updates about the progress of this potential project approval.

Sincerely,



Dean Wallraff, Attorney at Law
Executive Director, Advocates for the Environment

10211 Sunland Blvd., Shadow Hills, CA 91040 (818) 650-0030 X101 dw@aenv.org

LETTER B2
Advocates for the Environment
Dean Wallraff, Attorney at Law
May 17, 2023

Response B2-1: This introductory comment is noted. More specific comments provided in this letter are further responded to below.

Response B2-2: This comment asserts that no substantial evidence supported the less than significant impact conclusion for three significance thresholds for GHG emissions. This comment also claims that the proposed project is likely to have a significant impact on GHG emissions that should be analyzed and mitigated appropriately according to the project's fair share of cumulative emissions.

The analysis of GHG impacts contained in the Recirculated Draft EIR is supported by substantial evidence. As described on page 4.6-22 of the Recirculated Draft EIR, Section 15064.4 of the *State CEQA Guidelines* states that: "A lead agency should make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate the amount of GHG emissions resulting from a project." In performing that analysis, the lead agency has discretion to determine whether to use a model or methodology to quantify GHG emissions or to rely on a qualitative analysis or performance-based standards. In making a determination as to the significance of potential impacts, the lead agency then considers: (1) the extent to which the project may increase or reduce GHG emissions as compared to the existing environmental setting; (2) whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project; and (3) the extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions.

In accordance with CEQA, the City made a good-faith effort to evaluate the project's GHG emissions based on the City's GHG Reduction Plan. Consistent with the *State CEQA Guidelines*, Section 15183.5, if a project is consistent with an adopted qualified GHG Reduction Plan that meets the standards, the lead agency may presume that the project would not have significant GHG emission impacts.

The City of Fresno's GHG Reduction Plan was adopted in December 2014 to reduce local community GHG emissions to 1990 levels by the year 2020, consistent with the State objectives set forth in AB 32. The City's 2014 GHG Reduction Plan meets the requirements for a Qualified GHG Reduction Plan and is designed to streamline environmental review of future development projects in Fresno, consistent with *State CEQA Guidelines* Section 15183.5.

The City of Fresno updated its 2014 GHG Reduction Plan in 2021 to conform with existing applicable State climate change policies and regulations to reduce local community GHG emissions to 40 percent below 1990 levels by the year 2030, consistent with the State objectives set by SB 32. The GHG Plan Update outlines strategies that the City will undertake to achieve its proportional share of GHG emission reductions. As required by CEQA Guidelines Section 15183.5, the Program EIR[1] for the General Plan and GHG Reduction Plan Update and City Council Hearings provide the environmental review and adoption in a public process.

The GHG Reduction Plan Update requires an analysis of GHG emissions to ensure that the change in land use designation would not result in a significant increase in GHG emissions compared to the existing land use designation. The proposed project would not require a change in the General Plan land use designation or the current zoning and would be consistent with the City's General Plan and Zoning applicable to the project site. Therefore, an analysis of the proposed project's estimated GHG emissions compared to the estimated GHG emissions associated with the maximum buildout of the existing designation would not be required.

The GHG Reduction Plan Update includes a Consistency Checklist to help the City provide a streamlined review process for new development projects that are subject to discretionary review pursuant to CEQA. The City evaluated the proposed project using the Consistency Checklist for consistency with the City's GHG Reduction Plan Update, as discussed on pages 4.6-22 and 4.6-23 of the Recirculated Draft EIR. The project's Consistency Checklist is included in Appendix H of the Recirculated Draft EIR. As shown in the Consistency Checklist, the proposed project would be consistent with the applicable strategies from the GHG Reduction Plan Update. Therefore, the proposed project would not generate GHG emissions, either directly or indirectly, that may have a significant effect on the environment, and impacts would be less than significant.

In addition, as described further in Responses B2-3 through B2-9 and on pages 4.6-23 through 4.6-26 of the Recirculated Draft EIR, the proposed project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs and would have a less than significant cumulative impact.

Response B2-3: The commenter states that evidence in the record before the City indicates that the project is inconsistent with applicable plans and policies designed to reduce GHG emissions, failed to fall within the adopted significance

[1] The Program EIR can be found online at: https://ceqanet.opr.ca.gov/2019050005/3.

thresholds, and is therefore likely to have a significant environmental impact due to high levels of GHG emissions.

Please refer to Response B2-2, above. The City's GHG Reduction Plan Update meets the requirements for a Qualified GHG Reduction Plan and is designed to streamline environmental review of future development projects in Fresno, consistent with *State CEQA Guidelines* Section 15183.5.

The Recirculated Draft EIR concluded that the proposed project is consistent with the City's GHG Reduction Plan Update, and the commenter has not presented evidence to the contrary. In addition, as described on pages 4.6-23 through 4.6-25 of the Recirculated Draft EIR, the proposed project was analyzed for consistency with Executive Order (EO) B-30-15, SB 32, AB 197, the 2017 Scoping Plan, and the 2022 Scoping Plan. The City's GHG Reduction Plan Update is consistent with the SB 32 statewide goal of reducing GHG emissions to 40 percent below 1990 levels by 2030. Further, as identified on page 4.6-25 of the Recirculated Draft EIR, Mitigation Measure AIR-1 requires the infrastructure for AC and/or DC chargers for electric heavy-duty trucks, which would be consistent with the State's advanced clean fleets rule, which has a goal of achieving a zero-emission truck and bus California fleet by 2045. Therefore, the Recirculated Draft EIR concluded that the proposed project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs and impacts would be less than significant, and the commenter has not presented evidence to the contrary.

Response B2-4: This comment states that the proposed project's estimated annual construction emissions would be approximately 1,961.0 metric tons of carbon dioxide equivalent (CO_2e) per year and the total operational emissions would be approximately 4,967 metric tons of CO_2e per year. Further, this comment states that the City concluded that the project meets all the Consistency Checklist requirements, does not conflict with the City of Fresno GHG Reduction Plan Update, and therefore results in a less than significant impact. However, this comment asserts that the significance determination is erroneous because the project is not compliant with Checklist item 2:b, which requires that new commercial buildings provide electric vehicle (EV) capable charging spaces at 4% to 10% of the parking spaces per the 2019 CALGreen code (Title 24, Part 11), Section 5.106.5.3.

The commenter is incorrect that the proposed project's estimated annual construction emissions would be approximately 1,961.0 metric tons of CO_2e per year. As shown in Table 4.6.E of the Recirculated Draft EIR, the proposed project would generate approximately 1,961.0 metric tons of CO_2e over the entire construction period, not per year.

As discussed in Appendix H, Greenhouse Gas Reduction Plan Update Checklist, of the Recirculated Draft EIR, the proposed project would not include commercial uses. As identified in the Project Description, the project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. As shown in Figure 3-5 of the Recirculated Draft EIR, the four buildings would be configured for heavy industrial uses and would potentially include small offices that would support the industrial/warehouse uses. The proposed project would not be considered an office or commercial land use. Therefore, Checklist item 2:b, intended for commercial land uses, is not applicable to the project. In addition, as identified in the Project Description, the proposed project would comply with the latest CALGreen building measures and 2022 Title 24 Standards. The 2022 CALGreen code includes mandatory measures for non-residential projects, which apply to all new non-residential buildings and include requirements for EV-capable spaces in accordance with Table 5.105.5.3.1 of CALGreen.[1] As such, although the proposed project is not a commercial project, the proposed project would be consistent with the 2022 CALGreen code, which is consistent with the requirements in the Greenhouse Gas Reduction Plan Update Checklist.

Response B2-5: This comment claims that the Recirculated Draft EIR excluded a meaningful analysis of several applicable plans adopted for the purpose of reducing GHG emissions and that the Recirculated Draft EIR identified and compared plans that are no longer applicable, including EO B-30-15, SB 32, AB 197, the 2017 Scoping Plan, and the 2022 Scoping Plan. In addition, this comment claims that the project is not consistent with the GHG Reduction Plan Update, so the lead agency will need to find a different basis to establish consistency with SB 32.

Please refer to Responses B2-2, B2-3, and B2-4. The City's GHG Reduction Plan Update meets the requirements for a Qualified GHG Reduction Plan and is designed to streamline environmental review of future development projects in Fresno, consistent with *State CEQA Guidelines* Section 15183.5. The Recirculated Draft EIR concluded that the proposed project is consistent with the City's GHG Reduction Plan Update, and the commenter has not presented evidence to the contrary. The City's GHG Reduction Plan Update is consistent with the SB 32 statewide goal of reducing GHG emissions to 40 percent below 1990 levels by 2030. In addition, the Recirculated Draft EIR qualitatively evaluates the proposed project according to the goals of EO B-30-15, SB 32, the 2017 Scoping Plan, and the 2022 Scoping Plan. The Recirculated Draft EIR concluded that the proposed project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of

[1] International Code Council. 2023. op. cit.

reducing the emissions of GHGs and impacts would be less than significant, and the commenter has not presented evidence to the contrary.

Response B2-6: This comment asserts that the proposed project would exceed estimated per-capita emissions and compares the result to the goals set out in the 2017 Scoping Plan. This comment incorrectly claims that the warehouse would employ 182 workers, resulting in per-service population emissions of approximately 27.29 metric tons of CO_2e per year, which is more than four times the 2030 goal of 6.0 metric tons of CO_2e per year.

As discussed in Response B2-2, above, on page 4.6-23 of the Recirculated Draft EIR, and in the GHG Reduction Plan Update, a quantitative analysis of GHG emissions is only required for projects that would require a change in the General Plan land use designation or zoning designation. The proposed project would not require a change in the General Plan land use designation or the current zoning and would be consistent with the City's General Plan and Zoning Ordinance. Therefore, an analysis of the proposed project's estimated GHG emissions would not be required. As stated above, the GHG Reduction Plan Update includes a Consistency Checklist to help the City provide a streamlined review process for new development projects that are subject to discretionary review pursuant to CEQA, which was used for the GHG analysis in the Recirculated Draft EIR. Therefore, an evaluation of per-capita emissions is not required. Furthermore, as discussed in Response B1-16, the TIS (Appendix M of the Recirculated Draft EIR) estimated that the proposed project would have approximately 4,920 employees. As such, the proposed project would result in per-service population emissions of 1.0 metric tons of CO_2e per year, which is well below the 2030 goal of 6.0 metric tons of CO_2e per year identified in the comment letter. Therefore, the proposed project would not generate GHG emissions, either directly or indirectly, that may have a significant effect on the environment, and impacts would be less than significant.

Response B2-7: This comment claims that the project is inconsistent with the 2022 Scoping Plan, which aims to achieve carbon neutrality by 2045.

In addition, as explained in Responses B2-4 and B2-5, the proposed project would comply with the latest CALGreen building measures and 2022 Title 24 Standards. As such, the proposed project would be consistent with State building code requirements as Title 24 advances to implement the building decarbonization goals by 2045 from the 2022 Scoping Plan. Further, as identified on page 4.6-25 of the Recirculated Draft EIR, Mitigation Measure AIR-1 requires the infrastructure for AC and/or DC chargers for electric heavy-duty trucks, which would be consistent with the State's advanced clean fleets rule, which has a goal of achieving a zero-emission truck and bus California fleet by 2045.

Response B2-8: This comment claims that the project would contribute to a significant cumulative GHG impact because the Recirculated Draft EIR has not demonstrated that the GHG impact is below the significance thresholds. Please refer to Responses B2-2, B2-3, and B2-4. The City's GHG Reduction Plan Update meets the requirements for a Qualified GHG Reduction Plan and is designed to streamline environmental review of future development projects in Fresno, consistent with *State CEQA Guidelines* Section 15183.5. The Recirculated Draft EIR concluded that the proposed project is consistent with the General Plan land use designation and the City's GHG Reduction Plan Update, and the commenter has not presented evidence to the contrary. Therefore, the Recirculated Draft EIR properly determined that the proposed project would not result in any significant project or cumulative impacts related to GHG emissions.

Response B2-9: This comment states that there is no evidence for the carbon dioxide (CO_2) efficiency of 203.98 pounds per megawatt-hour (lbs/MWhr), a parameter that was used for CalEEMod.

The CO_2 intensity in CalEEMod was based on default assumptions based on PG&E as the utility company. As discussed in the CalEEMod User Guide,[1] when a specific utility is selected, the intensity factors for CO_2, methane (CH_4) and nitrous oxide (N_2O) will be automatically populated with defaults applicable to the specified utility. The intensity factors are used in various modules to calculate the GHG emissions associated with electricity use. The default values are based on CARB's Local Government Operations Protocol (LGO)[2] for CO_2, updated public utility protocols for CO_2, and E-Grid values for CH_4 and N_2O. Each default CO_2 intensity factor is based on the latest reporting year available for each utility. Appendix D, Table 1.2, of the CalEEMod User Guide provides the default CO_2 intensity factor and reporting year from which the factor was identified for each utility identified in the drop-down list.

Response B2-10: This comment states that the CalEEMod analysis indicates a population of zero, although presumably there will be some non-zero service population due to the need for employees to conduct general operations at the warehouse.

In regard to comments regarding the population of zero, according to the CalEEMod User Guide, Appendix A, population data is only used to estimate emissions associated with ***residential*** land uses. CalEEMod does not consider employees as population. Since the proposed project does not include residential uses and population is not used to calculate non-residential

[1] California Air Pollution Control Officers Association (CAPCOA). 2021. *California Emissions Estimator Model User's Guide Version 2020.4.0.* May. Website: http://www.aqmd.gov/caleemod/user's-guide (accessed May 2022).

[2] Available at: http://www.arb.ca.gov/cc/protocols/localgov/localgov.htm.

emissions, the Recirculated Draft EIR's use of a zero population for CalEEMod purposes was appropriate and consistent with standard practice.

Response B2-11: This comment states that certain EMFAC adjustment factors were changed and that certain values are reported as zero when there is evidence that it would result in emissions in reality. For example, the entry for "architectural coatings," which are paints or other products for the exterior of the building, would likely be used and release some amount of GHGs that should be accounted for.

Further, the comments claiming EMFAC adjustment factors were changed and that certain values are reported as zero, including architectural coating, are not correct. The non-default changes to CalEEMod include the following: adjusting the construction schedule based on the project schedule; updating the vehicle trips and fleet mix to account for the vehicle and truck trip generation for the proposed project as identified in the TIS; and assuming compliance with SJVAPCD Regulation VIII (Fugitive PM_{10} Prohibitions) and use of Tier 4 construction equipment as required by Mitigation Measure AIR-2. These nondefault changes were made in CalEEMod based on project-specific information provided by the project applicant. The commenter is incorrect that changes were made to EMFAC adjustment factors and architectural coating assumptions in CalEEMod.

Response B2-12: This comment states that the identification and analysis of mitigation is necessary for the proposed project. Please refer to Responses B2-2 and B2-3. The City's GHG Reduction Plan Update meets the requirements for a Qualified GHG Reduction Plan and is designed to streamline environmental review of future development projects in Fresno, consistent with *State CEQA Guidelines* Section 15183.5. In addition, the proposed project would comply with the latest CALGreen building measures and 2022 Title 24 standards and would also include cool roof materials. The proposed project would include EV-capable spaces and Mitigation Measure AIR-1, as identified in Section 4.2, Air Quality, which requires the infrastructure for AC and/or DC chargers for electric heavy-duty trucks. This would be consistent with the State's advanced clean fleets rule, which has a goal of achieving a zero-emission truck and bus California fleet by 2045. The Recirculated Draft EIR concluded that the proposed project is consistent with the City's GHG Reduction Plan Update, and the commenter has not presented evidence to the contrary. Therefore, the Recirculated Draft EIR properly determined that the proposed project would not result in any significant impacts related to GHG emissions. As such, identification and analysis of mitigation measures is not required. (See Public Resources Code [PRC] § 21100, subd. (b)(3); *San Franciscans for Reasonable Growth v. City and County of San Francisco* [1989] 209 Cal.App.3d 1502, 1517.)

Response B2-13: This comment claims that the Recirculated Draft EIR identified VMT impacts as "less than significant" without mitigation, based on the fact that the project's estimated VMT per employee is lower than the regional average of 25.6 miles. This comment states that this conclusion cannot stand without adequately supporting the validity of the chosen significance threshold. This comment also states that even if the City can demonstrate that the current average value is less than significant, it must still analyze the potential need for VMT reductions in the future and how the project will meet the goals for the reasonable lifetime of an office/warehouse building.

As discussed on page 4.10-12 of the Recirculated Draft EIR, CEQA Guidelines Section 15064.3(b)(4) states that "[a] lead agency has discretion to evaluate a project's vehicle miles traveled, including whether to express the change in absolute terms, per capita, per household or in any other measure. A lead agency may use models to estimate a project's vehicle miles traveled and may revise those estimates to reflect professional judgment based on substantial evidence. Any assumptions used to estimate vehicle miles traveled and any revision to model outputs should be documented and explained in the environmental document prepared for the project. The standard of adequacy in Section 15151 shall apply to the analysis described in this section."

In addition, as discussed on page 4.10-12, on June 25, 2020, the City of Fresno adopted CEQA Guidelines for Vehicle Miles Traveled Thresholds (VMT Guidelines), pursuant to SB 743, to be effective as of July 1, 2020. The City's document serves as a detailed guideline for preparing VMT analyses consistent with SB 743 requirements for development projects, transportation projects, and plans. Project applicants are required to follow the guidance provided in the City's document for preparation of CEQA VMT analysis. As such, the significance threshold used in the Recirculated Draft EIR was obtained from the City's VMT Guidelines. The City's VMT Guidelines include substantial evidence for establishment of the region's significance thresholds. The City's VMT Guidelines state the following:

> "The purpose of the CEQA analysis is to disclose and reduce GHG emissions by reducing the number and length of automobile trips. As part of the SB 375 land use/transportation integration process and the GHG goal setting, the State and Regional Transportation Planning Agencies (RTPA) have agreed to reduce GHG through integrated land use and transportation planning by a statewide average of approximately 15 percent by 2035..."

Based on the City's VMT Guidelines, to achieve these goals, the regional VMT per employee would be reduced if a project's VMT per employee is less than the regional VMT per employee threshold. In case of the Fresno region, the threshold is 13 percent below the existing VMT per employee for the region.

Therefore, a project that would have a VMT per employee lower than the regional threshold would help achieve the targeted VMT and GHG goals for the region.

The analysis for existing conditions presents a conservative scenario. The project trip lengths are longer in the existing conditions compared to future conditions as explained on page 4.10-14 of the Recirculated Draft EIR. The project trip lengths are reduced in the future due to additional developments occurring in the region compared to existing conditions. These additional developments allow for intervening opportunities closer to the project, compared to the lengthier distances between existing land uses under existing conditions. Therefore, the existing conditions have been analyzed for the project consistent with recommendations from the City's guidelines. The guidelines provide substantial evidence demonstrating the appropriateness of the VMT analysis methodology consistent with the intended goals for SB 743.

This comment does not identify any new significant environmental issues or impacts that were not already addressed in the Recirculated Draft EIR. Neither this comment nor the response constitutes new information requiring recirculation of the Recirculated Draft EIR.

Response B2-14: This comment states that the project conflicts with the measures outlined in applicable plans and policies and clearly conflicts with key plans. This comment is noted. For the reasons explained in the responses above, the Recirculated Draft EIR properly evaluated the proposed project's potential impacts, and the commenter has not presented substantial evidence to the contrary. Therefore, a revised EIR is not required.

Re: **Comments on Draft Environmental Impact Report for the 2740 West Nielsen Avenue Office/Warehouse Project, Development Permit Application No. P21-02699 and Tentative Parcel Map No. P21-05930 (SCH 2022050265)**

Dear Mr. Martinez:

We write on behalf of Fresno Residents for Responsible Development ("Fresno Residents") to provide comments on the Draft Environmental Impact Report ("DEIR") and Recirculated DEIR ("RDEIR") prepared by the City of Fresno ("City") for the 2740 West Nielsen Avenue Office/Warehouse Project, Development Permit Application No. P21-02699 and Tentative Parcel Map No. P21 05930 (SCH 2022050265) ("Project"), proposed by Scannell Properties ("Applicant").[1] B3-1

The Project proposes construction of four office/warehouse buildings that would be configured for heavy industrial uses.[2] The proposed buildings would result in a total gross floor area of approximately 901,438 square feet.[3] The buildings' exterior height would be up to 44 feet with an interior height of up to 36 feet and designed with a total of 201 loading dock doors on the north and south

[1] City of Fresno, Draft Environmental Impact Report, 2740 West Nielsen Avenue Office/Warehouse Project (SCH: 2022050265) (hereinafter "DEIR") (February 2023); *and* Recirculated Draft Environmental Impact Report, 2740 West Nielsen Avenue Office/Warehouse Project (SCH: 2022050265) (hereinafter "RDEIR") (April 2023) available at https://ceqanet.opr.ca.gov/2022050265/3
[2] DEIR, p. 1-3.
[3] DEIR, p. 1-3.

printed on recycled paper

sides of the buildings.[4] The four buildings would be comprised of the following: Building 1 would be 468,812 square feet and would provide 122 loading dock doors; Building 2 would be 248,786 square feet and would provide 46 loading dock doors; Building 3 would be 93,074 square feet and would provide 18 loading dock doors; and Building 4 would be 90,766 square feet and would provide 15 loading dock doors.[5] The Project site is located at 2740 West Nielsen Avenue, between North Marks and North Hughes Avenues in the City and County of Fresno.[6] The 48.03-acre Project site is currently vacant but formerly consisted of an industrial warehouse that has since been demolished.[7] The Project site is bounded to the north by partially developed land, to the east by North Hughes Avenue, to the south by West Nielsen Avenue, and to the west by North Marks Avenue.[8] Regional access to the site is provided by State Route 180 ("SR-180"), which is located approximately 0.3 mile south of the project site, and State Route 99 ("SR-99"), which is located approximately 0.8 miles east of the project site.[9]

B3-1 cont.

The Project proposes a total of 594 on-site parking spaces for vehicles and trucks.[10] Of the 594 parking spaces, 385 spaces are allocated for passenger vehicles, 11 spaces for accessible vehicles, and 10 spaces for accessible vans. [11] The remaining 188 spaces are allocated for trailers and are proposed to be located along the eastern and western edges of the project site.[12]

The Applicant seeks the following approvals from the City in order to construct the Project: certification of the EIR; development permit; tentative parcel map; water connection permit; and sanitary sewer connection permit.[13] The Project also requires approval from Pacific Gas & Electric ("PG&E") for electrical and natural gas connections, Central Valley Regional Water Quality Control Board ("RWQCB") for a Storm Water Pollution Prevention Plan, and San Joaquin Valley Air Pollution Control District ("SJVAPCD") for a Dust Control Plan Approval letter and compliance with Rule 9510 – Indirect Source Review.[14]

[14] DEIR, p. 3-18.

Based upon our review of the DEIR and supporting documentation, we conclude that the DEIR fails to comply with the requirements of the California Environmental Quality Act[15] ("CEQA"). The DEIR fails to adequately analyze many of the Project's significant environmental impacts and fails to propose enforceable mitigation measures that can reduce those impacts to a less than significant level, as required by CEQA.

As explained more fully below, the DEIR fails to properly analyze and mitigate the Project's transportation, air quality, health risk, GHG emissions, energy, and noise impacts. The DEIR fails to support its significant findings with substantial evidence, and fails to mitigate the Project's significant impacts to the greatest extent feasible, in violation of CEQA. The Project also conflicts with applicable land use plans and policies, resulting in land use inconsistencies as well as significant impacts under CEQA. The City may not approve the Project until the City revises the DEIR to adequately analyze the Project's significant direct, indirect and cumulative impacts, and incorporates all feasible mitigation measures to avoid or minimize these impacts to the greatest extent feasible. B3-2

We reviewed the DEIR, technical appendices, and reference documents, with the assistance of our expert consultants, including air quality and hazardous materials expert James J.J. Clark, Ph.D. of Clark and Associates, noise expert Derek Watry of Wilson Ihrig, and transportation expert Normal Marshall of Smart Mobility whose comments and qualifications are included as Attachment A, Attachment B, and Attachment C respectively.[16] Dr. Clark, Mr. Watry, and Mr. Marshall provide substantial evidence of potentially significant impacts that have not been adequately disclosed, analyzed, or mitigated. The City must address and respond to their comments separately and fully.[17]

I. STATEMENT OF INTEREST

Fresno Residents is an unincorporated association of individuals and labor organizations that may be adversely affected by the potential impacts associated with Project development. East Bay Residents includes the International Brotherhood of Electrical Workers Local 100, Plumbers and Pipefitters UA Local B3-3

[15] Pub. Resources Code (hereinafter "PRC") §§ 21000 et seq.; 14 Cal. Code Regs (hereinafter "CEQA Guidelines") §§ 15000 et seq.
[16] **Exhibit A**, James J.J. Clark, Ph.D., Clark & Associates (hereinafter "Clark Comments"); **Exhibit B**, Derek Watry, Wilson Ihrig (hereinafter "Watry Comments"); **Exhibit C**, Norman Marshall, Smart Mobility (hereinafter "Marshall Comments").

442, Sheet Metal Workers Local 104, Sprinkler Fitters Local 669, District Council of Ironworkers their members and their families, and other individuals that live and/or work in the City of Fresno and Fresno County.

Fresno Residents support sustainable development in the City. Residents have a strong interest in enforcing the State's environmental laws that encourage sustainable development and ensure a safe working environment for its members. Large warehouse projects like this Project should avoid adverse impacts to air quality, noise levels, transportation, biological resources, and public health, and should take all feasible steps to ensure unavoidable impacts are mitigated to the maximum extent feasible. Only by maintaining the highest standards can commercial and industrial development truly be sustainable.

The individual members of Fresno Residents live, work, recreate, and raise their families in the City of Fresno and surrounding communities. Accordingly, they would be directly affected by the Project's environmental and health and safety impacts. Individual members may also work constructing the Project itself. They would be the first in line to be exposed to any health and safety hazards which may be present on the Project site. They each have a personal interest in protecting the Project area from unnecessary, adverse environmental and public health impacts.

B3-3 cont.

In addition, Fresno Residents has an interest in enforcing environmental laws that encourage sustainable development and ensure a safe working environment for its members. Environmentally detrimental projects can jeopardize future jobs by making it more difficult and more expensive for business and industry to expand in the region, and by making the area less desirable for new businesses and new residents. Indeed, continued environmental degradation can, and has, caused construction moratoriums and other restrictions on growth that, in turn, reduce future employment opportunities.

Finally, Fresno Residents is concerned with projects that can result in serious environmental harm without providing countervailing economic benefits. CEQA provides a balancing process whereby economic benefits are weighed against significant impacts to the environment.[18] It is in this spirit we offer these comments.

[18] PRC § 21081(a)(3); *Citizens for Sensible Development of Bishop Area v. County of Inyo* (1985) 172 Cal.App.3d 151, 171.

II. LEGAL BACKGROUND

CEQA requires public agencies to analyze the potential environmental impacts of their proposed actions in an EIR.[19] "The foremost principle under CEQA is that the Legislature intended the act to be interpreted in such manner as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language."[20]

CEQA has two primary purposes. First, CEQA is designed to inform decisionmakers and the public about the potential significant environmental effects of a project.[21] "Its purpose is to inform the public and its responsible officials of the environmental consequences of their decisions before they are made. Thus, the EIR 'protects not only the environment but also informed self-government.'"[22] The EIR has been described as "an environmental 'alarm bell' whose purpose it is to alert the public and its responsible officials to environmental changes before they have reached ecological points of no return."[23] As the CEQA Guidelines explain, "[t]he EIR serves not only to protect the environment but also to demonstrate to the public that it is being protected."[24]

B3-4

Second, CEQA requires public agencies to avoid or reduce environmental damage when "feasible" by requiring consideration of environmentally superior alternatives and adoption of all feasible mitigation measures.[25] The EIR serves to provide agencies and the public with information about the environmental impacts of a proposed project and to "identify ways that environmental damage can be avoided or significantly reduced."[26] If the project will have a significant effect on the environment, the agency may approve the project only if it finds that it has

"eliminated or substantially lessened all significant effects on the environment" to the greatest extent feasible and that any unavoidable significant effects on the environment are "acceptable due to overriding concerns."[27]

While courts review an EIR using an "abuse of discretion" standard, "the reviewing court is not to 'uncritically rely on every study or analysis presented by a project proponent in support of its position. A clearly inadequate or unsupported study is entitled to no judicial deference."[28] As the courts have explained, a prejudicial abuse of discretion occurs "if the failure to include relevant information precludes informed decisionmaking and informed public participation, thereby thwarting the statutory goals of the EIR process."[29] "The ultimate inquiry, as case law and the CEQA guidelines make clear, is whether the EIR includes enough detail 'to enable who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project.'"[30]

B3-4 cont.

III. THE PROJECT DESCRIPTION IS INADEQUATE

The DEIR does not meet CEQA's requirements because it fails to include an accurate and complete Project description, rendering the entire analysis inadequate. California courts have repeatedly held that "an accurate, stable and finite project description is the *sine qua non* of an informative and legally sufficient EIR."[31] CEQA requires that a project be described with enough particularity that its impacts can be assessed.[32] Without a complete project description, the

[32] CCR § 15124; *see, Laurel Heights Improvement Assn. v. Regents of the Univ. of Cal.* (1988) 47 Cal.3d 376, 192–193.

environmental analysis under CEQA is impermissibly limited, thus minimizing the project's impacts and undermining meaningful public review.[33] A lead agency may not hide behind its failure to obtain a complete and accurate project description.[34]

CEQA Guidelines section 15378 defines "project" to mean "the whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment."[35] "The term "project" refers to the activity which is being approved and which may be subject to several discretionary approvals by governmental agencies. The term project does not mean each separate governmental approval.[36] Courts have explained that a complete description of a project must "address not only the immediate environmental consequences of going forward with the project, but also all "reasonably foreseeable consequence[s] of the initial project."[37] "If a[n]…EIR…does not adequately apprise all interested parties of the true scope of the project for intelligent weighing of the environmental consequences of the project, informed decisionmaking cannot occur under CEQA and the final EIR is inadequate as a matter of law."

B3-5 cont.

A. The DEIR Fails to Identify the End Users of the Project

The Project description typically need not identify the end user for a project because CEQA is concerned with the project's environmental impacts, not who uses it.[38] However, courts have held that where the tenant, or type of business, is known and there is evidence that an impact unique to that tenant or type of business will result, an EIR must disclose that information.[39] Here, the type of end users of the Project may have significant environmental impacts depending on the truck trips that those end users will generate.

B3-6

The DEIR assumes that the end users of the site will generate truck trips consistent with the average trip generation rate of 2.13 trucks per 1,000 square feet found in the Western Riverside Council of Governments ("WRCOG") Transportation Uniform Mitigation Fee ("TUMF") High-Cube Warehouse Trip Generation Study

[39] *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 CA4th 1184, 1213.

("WRCOG Study").[40] However, the WRCOG Study shows that trip generation rates can vary widely depending on the end user of a project. For example, the WRCOG Study found that an Amazon facility generated 4.5 daily trips per 1,000 square feet, twice the rate assumed in the DEIR.[41] This approach is unsupported and is likely to underestimate impacts. Since the City lacks information about the type of end user that will ultimately occupy the Project warehouses after construction, the DEIR should have analyzed truck trips based on the *most intensive* reasonably foreseeable use of the site, not an average use, because the City has no evidence that Project truck trips will less intensive, or "average," when compared to other comparable facilities.

B3-6 cont.

The DEIR relies on average trip generation rates for its analysis of the Project's operational air quality, health risk, GHG emissions, energy, noise, and vehicle miles traveled ("VMT") impacts. The DEIR may therefore substantially underestimate the severity of each of these impacts of a more trip-intensive use occurs at the Project site. The DEIR should be revised to calculate impacts based on the most intensive foreseeable uses at the Project site.

B. The DEIR Fails to Disclose Whether the Project Will Require Use of Backup Generators

An EIR must include an analysis of the environmental effects of a proposed future expansion or other future action at a project site if: (1) it is a reasonably foreseeable consequence of the initial project; and (2) the future expansion or action will be significant in that it will likely change the scope or nature of the initial project or its environmental effects.[42] Commercial and industrial businesses commonly rely on backup generators ("BUG") to supply emergency power during project operations in order to limit downtime.

B3-7

A recent study of BUG use in California ("BUG Study") found that backup generator use is sharply rising among commercial and industrial land uses, and are clustered in existing environmentally burdened communities.[43] For example, in the South Coast Air Quality Management District, BUG use significantly expanded between 2020 and 2021, growing from 12,104 in 2020 to 14,785 in 2021, a 22

[40] DEIR, 4.10-9.

[41] Marshall, p. 4.

[42] *Id*.

[43] M.Cubed, Diesel Back-Up Generator Population Grows Rapidly in the Bay Area and Southern California ("BUG Use Study") (2021) p. 7. Available at

percent increase.[44] The BUG Use Study found that forty-seven percent of generators are sited in communities classified as being in CalEnviroScreen's 80th to 100th percentile for pollution burden, with 33 percent of BUGs located in communities above the 90th percentile.[45] Backup generators commonly rely on fuels such as natural gas or diesel,[46] and thus can significantly impact air quality, GHG emissions, and public health through toxic diesel particulate ("DPM") emissions.[47] As the end users of the Project will likely not want to stop operations during power supply emergencies, it is reasonably foreseeable that the Project would use on-site BUGs. Therefore, the DEIR must disclose whether the Project will use BUGs, and, if so, analyze the effects of the Project's use of generators. The DEIR's failure to provide any information about the use of generators causes the DEIR to fail as an informational document.

B3-7 cont.

C. The DEIR Fails to Disclose Whether the Project Will Require Use of Diesel Fire Pumps

The DEIR fails to analyze the diesel emissions from routine testing and operation of fire pumps at the Project site. An email from the City Fire Department to the City Planning Department sent on September 16, 2022 explains that "warehouse developments of this [Project's] size will typically have high demand fire sprinkler systems for high rack storage and fire sprinkler systems will be

B3-8

[47] California Air Resources Board, Emission Impact: Additional Generator Usage Associated with Power Outage (January 30, 2020), available at https://ww2.arb.ca.gov/resources/documents/emissions-impact-generator-usage-during-psps (showing that generators commonly rely on gasoline or diesel, and that use of generators during power outages results in excess emissions); California Air Resources Board, Use of Back-up Engines for Electricity Generation During Public Safety Power Shutoff Events (October 25, 2019), available at https://ww2.arb.ca.gov/resources/documents/use-back-engines-electricity-generation-during-public-safety-power-shutoff ("When electric utilities de-energize their electric lines, the demand for back-up power increases. This demand for reliable back-up power has health impacts of its own. Of particular concern are health effects related to emissions from diesel back-up engines. Diesel particulate matter (DPM) has been identified as a toxic air contaminant, composed of carbon particles and numerous organic compounds, including over forty known cancer-causing organic substances. The majority of DPM is small enough to be inhaled deep into the lungs and make them more susceptible to injury. Much of the back-up power produced during PSPS events is expected to come from engines regulated by CARB and California's 35 air pollution control and air quality management districts (air districts)").

supplemented with private fire pumps as needed."[48] However, the DEIR's CalEEMod output sheets located in Appendix C, which show the results of the DEIR's air quality impacts analysis, fail to include an output for the Project's fire pumps.[49] The DEIR's failure to provide any information about the Project's use of fire pumps causes the DEIR to fail as an informational document.

B3-8 cont.

IV. THE DEIR FAILS TO ADEQUATELY ESTABLISH THE EXISTING BASELINE

The DEIR fails to accurately disclose the baseline environmental conditions related to the Project's health risk impacts. As a result, the DEIR lacks the necessary baseline information against which to measure the Project's environmental impacts with regard to impacts on sensitive receptors from construction.

The existing environmental setting is the starting point from which the lead agency must measure whether a proposed project may cause a significant environmental impact.[50] CEQA defines the environmental setting as the physical environmental conditions in the vicinity of the project, as they exist at the time the notice of preparation is published, from both a local and regional perspective.[51] Describing the environmental setting accurately and completely for each environmental condition in the vicinity of the Project is critical to an accurate, meaningful evaluation of environmental impacts. The courts have clearly stated that,"[b]efore the impacts of a project can be assessed and mitigation measures considered, an [environmental review document] must describe the existing environment. It is only against this baseline that any significant environmental effects can be determined."[52]

A. The DEIR Fails to Adequately Establish the Existing Baseline with Respect to Valley Fever

The DEIR includes a single paragraph describing the cause of Valley Fever and its impacts on health.[53] However, the DEIR fails to explain the significance of Valley Fever with regard to the Project site, thereby failing to provide context on the environmental setting of the Project. This results in the failure to analyze the potential impacts of Valley Fever exposure to Project construction workers and nearby sensitive receptors.

Valley Fever is a disease that can spread when persons are exposed to *Coccidioides immitis* ("*Cocci*") fungus spores during ground disturbance.[54] Impacts to human health from Valley Fever can be severe, cause long lasting health problems, and can even result in death.[55] The fungus lives in the top 2 to 12 inches of soil, and when disturbed by activities such as digging, construction activities (e.g. site preparation and grading), dust storms, or during earthquakes, the fungal spores become airborne.[56] The Project will disturb up to 120 acres of soil during construction which may lead to the release of fungus spores resulting in impacts to Project workers and nearby sensitive receptors.[57]

B3-10

Valley Fever is highly endemic in Fresno County.[58] According to the California Department of Public health, Fresno County had a Valley Fever case rate of 43.6 per 100,000 residents in 2020, and 39.8 per 100,000 residents in 2021.[59] The Valley Fever case rate in Fresno County was approximately double the statewide case rate averages in 2020 and 2021 of 18.2 and 20.1 respectively and the County has the fifth highest case rate among California's 58 counties.[60] For this reason, the Legislature mandates that employers at worksites in Fresno County provide effective awareness training on Valley Fever to all employees.[61]

[57] DEIR, Appendix C, CalEEMod Output Sheets, p. 9 of 34.
[58] Labor Code § 6709(b).
[59] California Department of Public Health, Epidemiologic Summary of Valley Fever (Coccidioidomycosis) in California, 2020-2021 (hereinafter "Valley Fever Report") (December 2022) p. 5. Available at https://www.cdph.ca.gov/Programs/CID/DCDC/CDPH%20Document%20Library/CocciEpiSummary2020-2021.pdf
[60] Valley Fever Summary, p. 5.
[61] Labor Code § 6709(a)-(d).

Despite the known presence of Valley Fever in the Project's vicinity and the potential impacts posed by exposure to the fungus spores, the DEIR fails to provide any information regarding the prevalence of *Cocci* fungus spores in the Project's vicinity, fails to discuss applicable construction worker Valley Fever training requirements and fails to include any Valley Fever-specific mitigation in the MMRP. This lack of information precludes meaningful analysis and mitigation of the potential health impacts the Project will cause to onsite construction workers and other individuals in close proximity to the Project site from disturbing soils which may be contaminated with Valley Fever spores site during Project construction.

B3-10 cont.

The City must prepare a revised DEIR which includes a proper discussion of the potential for the presence of *Cocci* fungus spores at the Project site in order to accurately analyze and mitigate the Project's potentially significant health risk impacts from Valley Fever.

V. THE DEIR FAILS TO DISCLOSE, ANALYZE AND MITIGATE POTENTIALLY SIGNIFICANT IMPACTS

An EIR must fully disclose all potentially significant impacts of a Project and implement all feasible mitigation to reduce those impacts to less than significant levels. The lead agency's significance determination with regard to each impact must be supported by accurate scientific and factual data.[62] An agency cannot conclude that an impact is less than significant unless it produces rigorous analysis and concrete substantial evidence justifying the finding.[63]

B3-11

Moreover, the failure to provide information required by CEQA is a failure to proceed in the manner required by CEQA.[64] Challenges to an agency's failure to proceed in the manner required by CEQA, such as the failure to address a subject required to be covered in an EIR or to disclose information about a project's environmental effects or alternatives, are subject to a less deferential standard than challenges to an agency's factual conclusions.[65] In reviewing challenges to an

[62] CEQA Guidelines § 15064(b).

[65] *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 435.

agency's approval of an EIR based on a lack of substantial evidence, the court will 'determine de novo whether the agency has employed the correct procedures, scrupulously enforcing all legislatively mandated CEQA requirements.'[66]

Additionally, CEQA requires agencies to commit to all feasible mitigation measures to reduce significant environmental impacts.[67] In particular, the lead agency may not make required CEQA findings, including finding that a project impact is significant and unavoidable, unless the administrative record demonstrates that it has adopted all feasible mitigation to reduce significant environmental impacts to the greatest extent feasible.[68]

B3-11 cont.

Even when the substantial evidence standard is applicable to agency decisions to certify an EIR and approve a project, reviewing courts will not 'uncritically rely on every study or analysis presented by a project proponent in support of its position. A clearly inadequate or unsupported study is entitled to no judicial deference.'"[69]

A. The DEIR Fails to Adequately Disclose, Analyze and Mitigate the Project's Significant Transportation Impacts

The DEIR concludes that the transportation impacts of the Project will be less than significant.[70] However, the transportation impacts analysis is flawed in with respect to the analysis of the Project's trip generation and the vehicle miles traveled ("VMT") impacts. In addition, the DEIR's incorrect and unsupported conclusions with respect to VMT and trip generation undermine the DEIR's analyses of the Project's air quality, health risk, energy, and GHG emissions impacts, which rely heavily on DEIR's trip generation and VMT calculations in their respective analyses.

B3-12

1. The DEIR Incorrectly Calculates the Project's Operational Trip Generation and Trip Length

The DEIR's trip generation analysis is not supported by substantial evidence because it relies on unsupported assumptions which contradict assumptions made elsewhere in the DEIR.

B3-13

[66] *Id., Madera Oversight Coal., Inc. v. County of Madera* (2011) 199 Cal. App. 4th 48, 102.

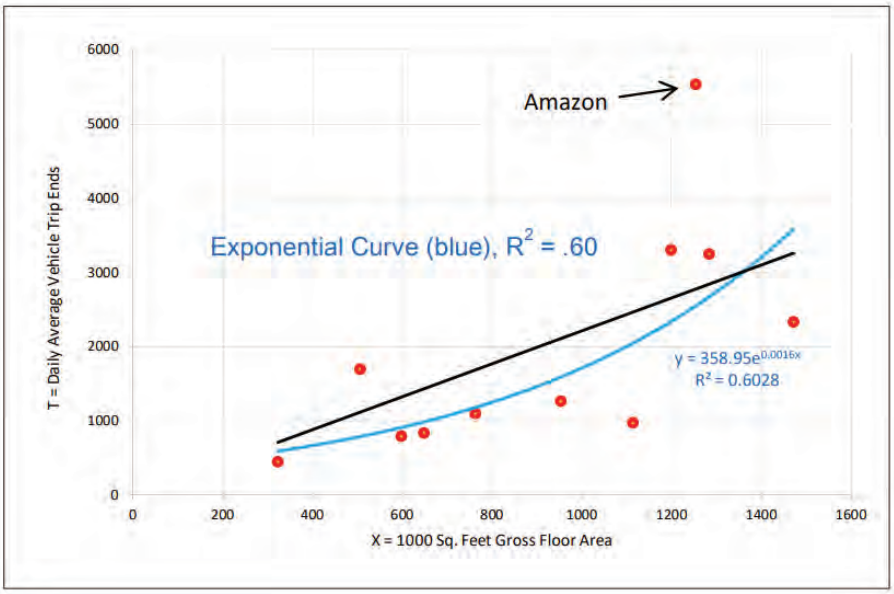
[68] PRC § 21081(a)(3), (b); CEQA Guidelines §§ 15090, 15091; *Covington v. Great Basin Unified Air Pollution Control Dist*. (2019) 43 Cal.App.5th 867, 883.
[69] *Berkeley Jets*, 91 Cal.App.4th at 1355.
[70] DEIR, p. 4.10-14.

As described above, the DEIR's transportation impacts analysis relies on the WRCOG Study to estimate the Project's trip generation.[71] The DEIR estimates that the Project would generate approximately 1,920 daily trips, with the AM and PM peak hours generating 110 and 148 trips respectively.[72]

The DEIR lacks substantial evidence to support the estimated trip generation because the DEIR unreasonably and without justification relies on the average derived from the WRCOG study. Mr. Marshall explains that data in the WRCOG Study are much more variable than the average rates suggest.[73] The WRCOG Study is based on counts at 16 warehouses, segmented between 11 fulfillment centers and 5 parcel hubs. As seen in Figure 1 below, the fulfillment center sites studied exhibited a wide range of trip generation rates, with an Amazon facility having an especially high rate.

Figure 1: WRCOG Study Facility Trip Generation Measurements[74]



B3-13 cont.

Based on the results of the WRCOG Study, it is clear that information regarding the future use of the Project site is crucial in understanding the trip generation rates of the Project. The DEIR admits that the future tenants of the

[71] DEIR, p. 4.10-9.
[72] DEIR, p. 4.10-9.
[73] Marshall Comments, p. 2.
[74] Marshall Comments, p. 2.

Project site have not been identified.[75] Because the future tenants are unknown, the City lacks the justification to assume that the Project will generate the average rate determined in the WRCOG Study, and should instead analyze a more intensive trip rate to ensure that the severity of the Project's potential transportation impacts is accurately disclosed. Mr. Marshall explains that, if the Amazon trip generation rate were applied to the Project, the Project would result in a trip generation rate twice as high as estimated in the DEIR.[76] Additionally, if the parcel hub rate of approximately 14 trips per 1,000 square feet were applied, the Project would generate over six times the number of trips estimated in the DEIR.[77]

B3-13 cont.

Because the City does not have information on the future tenants of the Project site, nor what the eventual use of the Project buildings will be, the City's reliance on the selected trip rates is unreasonable and unsupported. To reasonably analyze the full scope of the Project's impacts related to future tenant uses, analysis of the Projects trip generation should use the most conservative estimate and present the data in a revised and recirculated DEIR for public review.

2. The DEIR Fails to Disclose and Analyze the Project's Potentially Significant VMT Impacts

The City's CEQA Guidelines for Vehicle Miles Traveled Thresholds ("VMT Guidelines") establish the criteria for evaluating a project's VMT impacts.[78] Specifically, the VMT Guidelines state that VMT per employee is the appropriate metric against which to measure a project's impacts, and that a project would have a significant impact if it will generate 13 percent or greater employee VMT than the existing regional average for specific uses.[79] The DEIR's transportation impact analysis relies on the Fresno Council of Governments ("COG") Activity Based Model ("ABM") and the trip generation rates discussed above to calculate the Project's anticipated VMT.[80] The DEIR's transportation analysis states that the existing regional average is 25.6 VMT per employee and that the Project will generate 19.8

B3-14

[75] DEIR, p. 1-3.
[76] Marshall Comments, p. 3.
[77] Marshall Comments, p. 3.
[78] City of Fresno, CEQA Guidelines for Vehicle Miles Traveled Thresholds (hereinafter "VMT Guidelines") (June 18, 2020) available at https://fresno.legistar.com/View.ashx?M=F&ID=8601948&GUID=9AEF1630-3BE3-45BF-9BB8-3D4BB9DB1677
[79] VMT Guidelines, p. 26.
[80] DEIR, p. 4.10-14.

VMT per employee.[81] Based on these figures, the DEIR concludes that the Project's VMT per employee rate is 22.66 percent lower than the existing regional average and therefore will not result in a significant impact.[82]

In his review, Mr. Marshall found that the Project's VMT analysis likely underestimates Project VMT. Mr. Marshall states that the DEIR estimates that 10.2% of daily trips are made by heavy trucks (5+ axles) and another 7.6% are made by medium trucks (2-4 axles) and that the average trip lengths are calculated to be 9.5 miles for work trips, and 7.3 miles for "other" trips.[83] However, these estimates are likely much lower than the actual average truck trip lengths that could be generated by the Project. Mr. Marshall notes that major intermodal facilities that would serve a warehouse distribution use at the Project site are located far away from the Project site, including:

- Rail intermodal facilities in Bakersfield 110 miles,
- Rail intermodal facilities in Stockton 120 miles,
- Port of Oakland 175 miles, and
- Port of Los Angeles 240 miles.

B3-14 cont.

As explained above, without knowing what the eventual use of the Project site will be, it is impossible to fully evaluate trip lengths. However, until more is known about the facility operations the City must account for the possibility of much greater truck trip length generation by the Project. Additionally, Mr. Marshall found that the DEIR's VMT analysis fails to incorporate data regarding trips that originate from outside of the Fresno COG ABM region.[84] As discussed above, this failure to include out of region trips is particularly important to understanding truck trip lengths to intermodal facilities and ports.

A full VMT analysis should be completed for the Project, including explicit consideration of truck trip length and truck VMT, and included in a revised and recirculated DEIR for the Project.

[81] DEIR, p. 4.10-14.
[82] DEIR, p. 4.10-14.
[83] Marshall Comments, p. 5.
[84] Marshall Comments, p. 6.

3. The DEIR Fails to Require Mitigation Measures to Reduce the Project's Potentially Significant Impacts

As discussed above, the Project may result in significant transportation impacts. Pursuant to the City's VMT Guidelines, when a Project exceeds the threshold, the Project's environmental document must include a section that contains mitigation measures to reduce the VMT impacts.[85]

As the VMT Guidelines note, the California Air Pollution Control Officers Association ("CAPCOA") *Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity* ("Handbook")[86] includes various strategies to reduce VMT which should be considered for implementation where a project will have a significant VMT impact.[87] The Handbook includes data regarding GHG emissions and proven effective methods that a local agency can employ to reduce GHG impacts, including reduction in GHG impacts from VMT.[88]

B3-15

The DEIR states that the Project may be subject to SJVAPCD Rule 9410 – Employer Based Trip Reduction, which requires employers with 100 or more eligible employees to establish employee trip reduction programs to reduce VMT, reducing emissions associated with work commutes.[89] However, compliance with this rule is not included in any mitigation measures for the Project. SJVAPCD Rules 9410 is similar to CAPCOA's measure "T-6 Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring)" which, according to CAPCOA, can result in up to 26 percent reduction in GHG emissions from VMT.[90] The Handbook states that the VMT reduction (and therefore, GHG emissions reduction) could be as great as 45 percent with the implementation of additional measures which include:

B3-16

- T-7 Implement Commute Trip Reduction Marketing
- T-8 Provide Ridersharing Program
- T-9 Implement Subsidized or Discounted Transit Program

[85] VMT Guidelines, p. 27.

[87] VMT Guidelines, p. 41.
[88] CAPCOA Handbook, p. 35.
[89] DEIR, p.
[90] CAPCOA Handbook, pp. 86-87.

- T-10 Provide End-of Trip Bike Facilities
- T-11 Provide Employer-Sponsored Vanpool
- T-12 Price Workplace Parking
- T-13 Implement Employee Parking Cash-Out[91]

Many of the individual measures included in the Handbook offer high potential reductions *even if only one measure is used*. For example, the maximum reduction produced by "T-11 Provide Employer-Sponsored Vanpool" is 20.4 percent.[92]

B3-16 cont.

The DEIR fails to include any mitigation measures to reduce the Project's VMT impacts and fails to include analysis of the feasibility of the above methods, or any other methods, to reduce the Project's potentially significant impacts. The City must evaluate the feasibility and effectiveness of mitigation measures to reduce the Project's VMT impacts in a revised and recirculated DEIR for the Project.

B. The DEIR Fails to Disclose, Analyze, and Mitigate the Project's Potentially Significant Health Risk Impacts

1. The DEIR Fails to Accurately Analyze the Project's Operational Health Risk

In order to assess the impact of the Project's operational emissions, the DEIR prepared a health risk assessment ("HRA") using AERMOD, which is used to estimate exhaust concentrations based on site and source geometry, source emissions strength, distance from the source to the receptor, and meteorological data.[93] Here, AERMOD was used to calculate the ground level concentration of DPM emissions associated with the project.[94] However, Dr. Clark found that that the air dispersion model used to calculate the Project's operational emissions has a structural flaw that results in inaccurate estimates of the Project emissions within the community.[95]

B3-17

Dr. Clark reviewed the City's AERMOD modeling and found that the City failed to account for the impact on emissions from building downwash, rendering the analysis incomplete. Dr. Clark explains that building downwash occurs as the wind flows over and around buildings and impacts the dispersion of pollution from

[91] CAPCOA Handbook, pp. 89-115.
[92] CAPCOA Handbook, p. 104.
[93] DEIR, p. 4.2-32.
[94] Clark Comments, p. 8.
[95] Clark Comments, p. 8.

nearby stacks.[96] A plume caught in the path of this flow is drawn into the wake, temporarily trapping it in a recirculating cavity which leads to higher ground-level concentration of chemicals emitted from sources.[97] Furthermore, the downwash effect increases as the relative difference between the release height and top of the building increases.[98] This effect is well-understood and is commonly used in emissions modeling. For example, analysis and mitigation of downwash is discussed in Section 123 of the Clean Air Act.[99]

The DEIR completely fails to account for this impact in its AERMOD modeling, nor does it provide any justification why. When a standard, accepted methodology is available to assess a significant impact, an EIR must evaluate the impact unless a reasoned basis for not doing so is provided.[100] In *Berkeley Keep Jets Over the Bay Comm. v. Board of Port Comm'rs*, the court reviewed a DEIR's failure to analyze health risk from TAC exposure. The DEIR claimed that no methodology or standards of significance existed for assessing the health risk from TAC exposure.[101] The court determined that the lead agency abused its discretion, reasoning that the lead agency failed to consider, in good faith, comments from the public showing that it was feasible to analyze health risk from TAC exposure:[102]

> The Port has not cited us to any reasonably conscientious effort it took either to collect additional data or to make further inquiries of environmental or regulatory agencies having expertise in the matter….At the very least, the documents submitted by the public raised substantial questions about the project's effects on the environment and the unknown health risks to the area's residents...the Port has not offered any justification why more definitive information could not have been provided.

Here, the City failed to analyze a critical dispersion factor - building downwash – which affects the rate and severity of exposure to toxic air contaminants, without explaining why. The City's failure to include this emission

[102] *Id.* at 1370.

factor in its health risk analysis represents a failure to accurately analyze and disclose the ground level concentration of DPM emissions generated by the Project. The DEIR fails as an informational document in this respect, and must be revised.

B3-17 cont.

2. The DEIR Fails to Analyze and Mitigate Valley Fever Impacts from Project Construction

As explained above, the DEIR fails to disclose the potential presence of *Cocci* fungus spores and fails to discuss any Valley Fever employee training measures the Applicant intends to take to protect its construction workers from Valley Fever exposure. As a result, the DEIR fails to analyze the Project's threat of Valley Fever exposure to workers and sensitive receptors, and fails to include mitigation measures to reduce the health risk impacts of Valley Fever.

According to the DEIR's air quality analysis, Project construction will include 40 days of site preparation which will disturb 60 acres of soil, and 40 days of grading activities which will disturb 120 acres of soil at the Project site.[103] Dr. Clark explains that, when soil containing the spores are disturbed by construction activities, the spores become airborne, exposing construction workers and other nearby sensitive receptors to potential infection.[104] Sensitive receptors near the Project site, including workers and those who live nearby are at risk from exposure from disturbed dust during Project construction.[105]

B3-18

Dr. Clark states that the most at-risk populations are construction and agricultural workers.[106] Additionally, he notes that the potentially exposed population in surrounding areas is much larger than construction workers because the nonselective raising of dust during Project construction will carry the very small spores which measure 0.002–0.005 millimeters into nonendemic areas, potentially exposing large non-Project-related populations.[107] According to the DEIR, the closest sensitive receptors to the Project site include the single-family residences located approximately 110 feet south of the project site across West Nielsen Avenue.[108] These sensitive receptors are at risk of Valley Fever infection from Project construction resulting in a significant health risk impact, and are not subject to the training requirements of Labor Code 6702. Furthermore, the small fungus spore particles will not be controlled by the conventional construction dust

[103] DEIR, Appendix C, CalEEMod Output Sheets, pp. 8 and 9 of 34.

[106] Clark Comments, p. 6.
[107] Clark Comments, p. 6.
[108] DEIR, p. 4.2-31.

control mitigation measures proposed in the DEIR under Mitigation Measure ("MM") Air-1.[109] Thus, off-site sensitive receptors may have a significant risk of exposure to Valley Fever spores with no mitigation.

The DEIR must be revised and recirculated to include an analysis of the Project's significant Valley Fever impacts, and to require that any and all mitigation measures that will reduce Valley Fever risks are incorporated as binding mitigation in the Project's Mitigation Monitoring and Reporting Program ("MMRP"). B3-18 cont.

3. Feasible Mitigation is Available to Reduce the Project's Significant Health Risk Impacts from Valley Fever

CEQA imposes the duty on the City to adopt all feasible mitigation measures to reduce significant health impacts from the Project. Yet here, the DEIR fails to incorporate any mitigation measures that would address Valley Fever risks to construction employees and sensitive receptors.

In his comments, Dr. Clark proposes a variety of feasible mitigation measures the DEIR should consider and adopt in a revised DEIR to reduce potential health impacts from Valley Fever.[110] The following mitigation measures identified in Dr. Clark's comments are based on actual experience during construction of projects in areas affected by the fungi that cause Valley Fever, these measures should be included in the DEIR's mitigation measures in addition to the measures required under MM Air-1:[111] B3-19

(1) Include specific requirements in the Project's Injury and Illness Prevention Program regarding safeguards to prevent Valley Fever.
(2) Control dust exposure through the following methods:

- Apply chemical stabilizers at least 24-hours prior to high wind event;
- Apply water to all disturbed areas a minimum of three times per day. Watering frequency should be increased to a minimum of four times per day if there is any evidence of visible wind-driven fugitive dust;
- Provide National Institute for Occupational Safety and Health (NIOSH)-approved respirators for workers with a prior history of Valley Fever.
- Half-face respirators equipped with a minimum N-95 protection factor

[109] Clark Comments, p. 6. *See also* DEIR, pp. 4.2-30 – 4.2-31.
[110] Clark Comments, pp. 6-8.
[111] *Id.* pp. 4-8.

for use during worker collocation with surface disturbance activities. Half-face respirators equipped with N-100 or P-100 filters should be used during digging activities. Employees should wear respirators when working near earth-moving machinery.

- Prohibit eating and smoking at the worksite, and provide separate, clean eating areas with hand-washing facilities.
- Avoid outdoor construction operations during unusually windy conditions or in dust storms.
- Consider limiting outdoor construction during the fall to essential jobs only, as the risk of cocci infection is higher during this season.

(3) Prevent transport of cocci outside endemic areas:

- Prevent spillage or loss of bulk material from holes or other openings in the cargo compartment's floor, sides, and/or tailgate;
- Provide workers with coveralls daily, lockers (or other systems for keeping work and street clothing and shoes separate), daily changing and showering facilities.
- Clothing should be changed after work every day, preferably at the work site.
- Train workers to recognize that cocci may be transported offsite on contaminated equipment, clothing, and shoes; alternatively, consider installing boot-washing.
- Post warnings onsite and consider limiting access to visitors, especially those without adequate training and respiratory protection.

B3-19 cont.

(4) Improve medical surveillance for employees:

- Employees should have prompt access to medical care, including suspected work-related illnesses and injuries.
- Work with a medical professional to develop a protocol to medically evaluate employees who have symptoms of Valley Fever.
- Consider preferentially contracting with 1-2 clinics in the area and communicate with the health care providers in those clinics to ensure that providers are aware that Valley Fever has been reported in the area. This will increase the likelihood that ill workers will receive prompt, proper and consistent medical care.
- Respirator clearance should include medical evaluation for all new employees, annual re-evaluation for changes in medical status, and annual training, and fit-testing.

- Skin testing is not recommended for evaluation of Valley Fever.112
- If an employee is diagnosed with Valley Fever, a physician must determine if the employee should be taken off work, when they may return to work, and what type of work activities they may perform.

Any mitigation measures must be included in the DEIR and be fully enforceable through permit conditions, agreements, or other legally binding instruments.[113] Failure to include enforceable mitigation measures is considered a failure to proceed in the manner required by CEQA.[114] In order to meet this requirement, mitigation measures must be incorporated directly into the EIR to be enforceable.[115]

B3-19 cont.

The DEIR must be revised and recirculated to include mitigation measures such as the those proposed by Dr. Clark to reduce the impacts of exposure to Valley Fever causing fungus spores and mitigate impacts to sensitive receptors.

C. The DEIR Fails to Analyze the Project's Potentially Significant Air Quality Impacts

The DEIR's air quality modeling fails to account for the use of diesel fueled backup generators and fire pumps during Project operation, resulting in a failure to accurately analyze the Project's air quality impacts. Additionally, as discussed above, the Project's trip generation rates are unsupported and cannot be relied upon by the City to determine that the Project will not have significant transportation impacts. The unsupported trip generation and VMT calculations resulted in a failure to analyze the Project's GHG emissions and air quality impacts. The failure to analyze specific Project components, and the reliance on unsupported conclusions in the DEIR undermined the Project's air quality analysis and prevented the City from finding that the Project will not result in significant air quality impacts.

B3-20

1. The DEIR Fails to Analyze Air Quality Impacts from the Operation of Backup Generators

The DEIR's air quality analysis fails to account for the operation of backup generators ("BUGs") during Project operation. Dr. Clark explains that diesel powered backup generators are commonly used in industrial warehouse Projects and would be operated during routine testing and in the event of a power failure.[116] The operation of BUGs generates diesel particulate matter ("DPM") which is identified as a toxic air contaminant, composed of carbon particles and numerous organic compounds, including over forty known cancer-causing organic substances.[117]

Additionally, by omitting BUGs from the air quality analysis, the DEIR fails to analyze all uses that stem from the reasonably foreseeable increase of generator use during Public Safety Power Shutoff ("PSPS") events and extreme heat events.[118] The recent rise of Extreme Heat Events ("EHEs") in the State has increased the amount of PSPS events and thus increased the amount of time generators are used.[119]

B3-21

EHEs "are defined as periods where in the temperatures throughout California exceed 100 degrees Fahrenheit."[120] In 2021, the Governor released one Executive Order regarding EHEs and one Proclamation for a State of Emergency with the intention to help avoid PSPS events.[121] CARB notes though that the number of Extreme Heat Events is likely to increase, and thereby PSPS events, with the continuing change in climate that the State is currently undergoing.[122]

According to the California Public Utilities Commission ("CPUC") de-energization report in October 2019, there were almost 806 PSPS events that impacted almost 973,000 customers (~7.5% of households in California) of which

---

[122] CARB 2017 Scoping Plan, p. 6, https://ww2.arb.ca.gov/sites/default/files/classic/cc/scopingplan/scoping_plan_2017.pdf

~854,000 of them were residential customers, and the rest were commercial, industrial, medical baseline, and other customers. [123] CARB's data also shows that on average each of these customers had about 43 hours of power outage in October 2019.[124] Dr. Clark notes that CARB concluded that PSPS events in October of 2019 alone generated 126 tons of NOx, 8.3 tons or particulate matter, and 8.3 tons of DPM.[125]

Dr. Clark concludes that every EHE and PSPS that occurs during Project operation would result in increased DPM from the reasonably foreseeable operation of BUGs at the Project.[126] While the City is not required to analyze the worst-case scenarios, there is substantial evidence demonstrating that PSPS events and EHE are reasonably foreseeable events which will require the use of BUGs at the Project site.

A detailed analysis of the emissions and noise from the hours of BUG testing and operation should be included in a revised EIR, including the extra time the BUG will need to run to account for EHEs and PSPS.

B3-21 cont.

2. The DEIR Fails to Analyze Air Quality Impacts from the Project's Truck Trips

As described above, the Project's transportation impact analysis fails to accurately analyze the Project's operational truck trip generation rates and likely underestimates the Project's VMT. The Project's air quality analysis relies on the transportation impact analysis' trip generation numbers and VMT in order to calculate the Project's air emissions and analyze the Project's air quality and GHG emissions impacts.[127] The DEIR's failure to accurately calculate the Project's trip generation results in the failure to accurately calculate the emissions from truck traffic during Project operation. The Project's transportation impact analysis must be corrected to accurately analyze the Project's air quality impacts in a revised DEIR.

D. The DEIR Fails to Adequately Analyze Potentially Significant Noise Impacts

The DEIR's noise analysis concludes that Project construction and operational noise is significant but will be reduced to less than significant with mitigation measures included in the DEIR.[128] Additionally, the DEIR found that the noise impacts from project-related traffic on offsite sensitive receptors would be less than significant and does not require mitigation.[129] However, the DEIR relies on a faulty methodology to analyze the Project's construction noise and improperly relies on a relative threshold of significance with regard to the Project's operational noise from traffic. The DEIR therefore fails to properly analyze and mitigate the Project's significant construction and operational noise impacts.

CEQA requires agencies to conduct noise analyses for projects that consider both the absolute noise levels expected, and the degree noise levels are expected to increase. Noise studies that rely on a single measure that excludes possible significant impacts from noise increases or noise extremes do not receive deference by reviewing courts.

B3-23

In *King & Gardiner Farms, LLC v. County of Kern*, the Court of Appeal held that an agency cannot simply rely on compliance with local noise regulations to conclude there will be no significant noise impacts without considering the impacts of increases in noise.[130] The County approved an EIR for proposed zoning amendments to streamline oil and gas permitting.[131] The EIR included an analysis of noise impacts that determined significance based solely on whether the 65 decibel day-night average ("dBA DNL") threshold in the County General Plan would be exceeded.[132] The Court of Appeal reasoned that the County General Plan did not conclude that all increases in the magnitude of noise are insignificant until the 65 dBA DNL threshold is exceeded, so the General Plan "does not constitute substantial evidence that the magnitude of an increase in ambient noise is irrelevant."[133] Rather, an EIR's noise analysis should consider both the increase in noise level and the absolute noise level associated with a project in determining the

[128] DEIR, pp. 4.9-18 and 4.9-23.
[129] DEIR, p. 4.9-21.
[130] *King & Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 894.
[131] *Id.* at 829.
[132] *Id.* at 830, 889.
[133] *Id.* at 894.

significance of the project's noise impacts.[134] The Court of Appeal concluded that an agency cannot exclusively rely on "a single cumulative DNL metric for determining the significance of the project's noise impacts" while deciding "the magnitude of the increase in ambient noise is irrelevant."[135]

In *Berkeley Jets*, the Court of Appeal invalidated the Port of Oakland's EIR for expansion of the Oakland Airport because of its reliance on an improper noise standard.[136] The EIR evaluated the significance of noise impacts based on whether the estimated level of sound would exceed 65 dB Community Noise Equivalent Level ("CNEL").[137] However, as the Court of Appeal explained, the CNEL metric—which averages noise over the course of a day—could not be the sole indicator of significant effects from noise because it does not provide a meaningful analysis of the "degree single overflights will create noise levels over and above the existing ambient noise level at a given location, and the community reaction to aircraft noise, including sleep disturbance."[138] Therefore, the Court concluded, a revised EIR with additional study of noise impacts from flights was necessary.[139]

B3-23 cont.

1. The DEIR Fails to Consider the Totality of Noise Impacts

With regard to the Project's traffic noise the DEIR relies only on a relative threshold to determine that the Project will not result in a significant impact. The DEIR states: "[b]ecause noise levels would increase less than 3.0 dBA, this is consistent with General Plan Policy NS-1-j: Significance Threshold which states that an increase of 3 dBA CNEL or more is considered significant."[140] However, as Mr. Watry points out, this rationale ignores the absolute increase in the noise environment and the cumulative effects of noise on sensitive receptors.[141]

B3-24

The DEIR cannot solely rely on a relative threshold of significance when looking at the sum of all noise sources against absolute criteria would reveal a significant noise impact. Indeed, as the court in *King & Gardiner Farms* held, an EIR should evaluate both the noise level increase *and* the absolute noise level associated with a Project when determining the significance of noise impacts.[142]

[141] Watry Comments, p. 3.
[142] *King & Gardiner Farms*, 45 Cal.App.5th at 894.

Similarly, the DEIR should evaluate the total noise impacts from the Project on nearby residential receptors. CEQA Guidelines require EIRs to "analyze any significant environmental effects the project might cause or risk exacerbating by bringing development and people into the area affected."[143]

The City's General Plan Policy NS-1-a establishes "65 dBA Ldn or CNEL as the standard for the desirable maximum average exterior noise levels for defined usable exterior areas of residential and noise-sensitive uses" such as those along Nielsen Avenue, south of the Project site.[144] Based on the data provided in the DEIR, the roadway segment on Nielsen Avenue between Marks and Hughs will see an increase from the existing 64.0 dBA CNEL to 66.1 dBA CNEL with Project construction.[145] Based on the DEIR's own data, the Project will cause noise levels at nearby sensitive receptors to exceed the desirable maximum average exterior noise levels for defined usable exterior areas of residential and noise-sensitive uses of 65 dBA CNEL, resulting in a significant impact.

B3-24 cont.

Mr. Watry notes that both Caltrans and the Federal Transit Administration ("FTA") recognize the need for absolute thresholds of significance in addition to relative thresholds when determining the significance of noise impacts for projects.[146] The FTA's noise impact assessment guidelines dictate that a 3 dBA Ldn increase in noise exposure at residences would only be allowed if the existing noise exposure is 55 dBA Ldn or less.[147] When the existing noise environment is above 55 dBA Ldn, the allowable increase is progressively smaller.[148] For example, under the FTA's criteria, where the existing noise exposure is 64.0 dBA CNEL, as it is at the Project site along Nielsen Avenue, the allowable increase is 1.5 dBA.[149] Under the absolute threshold established by the FTA, the Project's anticipated 2.1 dBA CNEL increase results in a significant impact.

[149] Watry Comments, p. 4.

2. The DEIR Fails to Analyze and Mitigate Potentially Significant Construction Noise Impacts

The DEIR's construction noise analysis calculates the noise levels expected from Project construction based on the Federal Highway Administration's ("FHWA") Roadway Construction Noise Model ("RCNM").[150] The DEIR includes the equations used to calculate the composite average noise level for construction equipment which considers: the reference noise emission level, the amount of time each piece of equipment is typically used, distance, and the total amount of equipment anticipated to be used on site.[151] However, as Mr. Watry states, the DEIR erroneously relies on FTA guidance which dictates that when specific information regarding Project construction is not known, construction noise may be calculated by combining the two loudest pieces of equipment assuming they are running at full power, 100 percent of the time.[152] Here however, specific project construction information is available, and can be used to produce a detailed calculation of the Project's construction noise impacts.

B3-25

Mr. Watry used the construction equipment inventory information contained in the DEIR's Appendix C: CalEEMod Output sheets to generate the list of equipment that will be used during each phase of Project construction. Using the reference noise emission levels and usage factors for the equipment from the DEIR in Table 4.9.K[153] Mr. Watry calculated the noise levels generated during each phase of construction combined with the existing ambient noise levels to determine the noise impacts on the closest residential receptors located south of the Project site.[154] Mr. Watry found that the Project's site prep phase will result in a noise level of 70.2 dBA Leq, while grading will result in noise levels of 71 dBA Leq, and building construction will result in noise levels of 69.0 dBA Leq.[155] When compared to the existing ambient noise level of 62.3 dBA Leq, Mr. Watry found that Project construction will result in noise exposure increases of 7.9, 8.7 and 6.7 dBA Leq during the Projects site prep, grading, and building phases respectively.[156] Therefore, the Project will exceed the DEIR's threshold of 5 dBA Leq during three phases of construction, resulting in a significant impact.

[150] DEIR, p. 4.9-16.
[151] Watry Comments, p. 5.
[152] Watry Comments, p. 5.
[153] DEIR, p. 4.9-16.
[154] Watry Comments, p. 5.
[155] Watry Comments, p. 6.
[156] Watry Comments, p. 6.

Finally, Mr. Watry notes that the requirements of MM NOI-1, which mandates the use of mufflers and the designation of a "disturbance coordinator" would not reduce the Project's significant construction noise impacts. First, Mr. Watry explains that the noise calculations use reference levels from equipment that are already equipped with mufflers, and it is unreasonable to believe that a second muffler would be added to construction equipment.[157] Second, he notes that while having a disturbance coordinator may be helpful to resolve noise issues as they arise, a noise coordinator will not reduce the noise emitted from Project construction equipment.[158]

B3-25 cont.

The City must revise the construction noise analysis in a recirculated DEIR and implement feasible construction noise mitigation measures to reduce the Project's significant noise impacts.

E. The DEIR Fails to Disclose, Analyze, and Mitigate the Project's Potentially Significant Energy Resources Impacts

1. The DEIR Lacks Evidentiary Support for the Determination that the Project Would Not Result in a Significant Environmental Impact Due to Wasteful, Inefficient, or Unnecessary Consumption of Energy Resources During Project Construction and Operation

B3-26

CEQA Guidelines Appendix F identifies the following means to achieve the goal of conserving energy: decreasing overall per capita energy consumption, decreasing reliance on fossil fuels, and increasing reliance on renewable energy sources.[159] In order to ensure that energy impacts are considered in project decisions, CEQA requires that EIRs include a discussion of the potential energy impacts of proposed projects and a detailed statement of mitigation measures designed to "minimize significant effects on the environment, including, but not limited to, measures to reduce the wasteful, inefficient, and unnecessary consumption of energy."[160]

---

[157] Watry Comments, p. 5.
[158] Watry Comments, p. 5.
[159] Appendix F at § I.
[160] PRC § 21100(b)(3); CEQA Guidelines, Appendix F, Energy Conservation ("Appendix F"), § I. Appendix F defines "Unavoidable Adverse Effects" as "wasteful, inefficient and unnecessary consumption of energy during the project construction, operation, maintenance and/or removal that cannot be feasibly mitigated."

Appendix F directs an EIR to consider the energy impacts of project operation, the effects on local and regional energy supplies, the effects on peak and base electricity demand, compliance with existing energy standards, and other effects on energy resources.[161] Further, Appendix F notes an EIR should consider whether the project involves "Unavoidable Adverse Effects" such as "wasteful, inefficient and unnecessary consumption of energy during the project construction, operation, maintenance and/or removal that cannot be feasibly mitigated."[162] Without the requisite energy analysis, the DEIR falls short of the mandates of Appendix F.

B3-26 cont.

First, the DEIR fails to adequately analyze the significance of the Project's energy impacts related to the Project's use of fossil fuels consumed by Project related vehicle trips. One of the stated goals in Appendix F is to *decrease* reliance on fossil fuels.[163] The DEIR states that the Project will increase gasoline consumption in the City of Fresno by 0.11 percent and diesel consumption by 0.5 percent and concludes that the increased fuel consumption from the Project is minimal and therefore not significant.[164] However, the DEIR fails to establish a threshold for fossil fuel consumption that would be significant. Therefore, the conclusion that the increased fuel consumption resulting from Project operation would not be significant is unsupported.

B3-27

The City must determine the appropriate threshold against which to measure the Project's fossil fuel consumption in order to determine whether the Project will result in a significant impact to energy resources. The analysis in the DEIR is deficient insofar as it does not assess or consider the significance of the increase in fossil fuel usage for the Project on energy resources consistent with Appendix F and does not consider mitigation to "minimize significant effects on the environment, including, but not limited to, measures to reduce the wasteful, inefficient, and unnecessary consumption of energy."[165]

Additionally, as detailed in the analysis of the Project's transportation impacts above, the DEIR fails to accurately account for the Project's trip generation, which Mr. Marshall found could exceed the DEIR's estimate by 100% or more. Increased trip generation would lead to increased fossil fuel use, and therefore, energy use, from Project related vehicle trips.

B3-28

[161] Appendix F §§ I, II.C, II.D.

[162] Appendix F § II.F.

[163] *Id.*

[164] DEIR, p. 4.5-9.

[165] PRC § 21100(b)(3).

Second, another stated goal for conserving energy set forth in Appendix F is "increasing reliance on renewable energy sources."[166] Appendix F further states that "Mitigation Measures may include: … 4. Alternate fuels (particularly renewable ones) or energy systems."[167] In line with Appendix F, the Fresno 2020 Greenhouse Gas Reduction Plan Update includes a Solar Assistance Policy intended to "[i]dentify and publicize information about financial mechanisms for private solar installations and provide over-the-counter permitting for solar installations meeting specified standards, which may include maximum size (in kV) of units that can be so approved."[168]

Here, the DEIR's discussion of renewable energy generation is virtually non-existent and fails to provide a meaningful "investigation into renewable energy options that might be available or appropriate for the project."[169] In *California Clean Energy Comm. v. City of Woodland*, the court held that the city's EIRs failed to comply with the requirements of Appendix F by not discussing or analyzing renewable energy options.[170] The court determined that "the City's EIRs omit any discussion or analysis of renewable energy options for Gateway II. CEQA is violated when an EIR contains no discussion of a potentially significant environmental consideration."[171]

B3-29

Here, the DEIR states that the Project would "comply with the "CALGreen Code (CCR Title 24, Part 11) and the California Energy Code (CCR Title 24, Part 6), which includes provisions related to insulation and design aimed at minimizing energy consumption."[172] However, the DEIR quickly dismisses any examination of further energy use reduction strategies by stating "[t]he California Energy Code includes solar photovoltaic system requirements for all newly constructed low-rise residential buildings; however, it currently does not include solar requirements for nonresidential buildings."[173] The DEIR must be revised to adequately analyze potential renewable energy generation for the Project and sufficiently analyze the related energy impacts.

---

[167] Appendix F § II.D.4.

[168] City of Fresno, Greenhouse Gas Reduction Plan Update (March 2020) p. 5-16. Available at https://www.fresno.gov/darm/wp-content/uploads/sites/10/2020/03/Appendix_G-GHG_Reduction_Plan_Update.pdf

[169] *California Clean Energy Comm. v. City of Woodland* (2014) 225 Cal. App. 4th 173, 213.

[170] *Id.*

[171] *Id.*

[172] DEIR, p. 4.5-11.

[173] DEIR, p. 4.5-11.

Finally, compliance with the Building Code and other energy efficiency requirements does not, by itself, constitute an adequate assessment of measures that can be taken to address the energy impacts during construction and operation of the Project. In *Ukiah Citizens for Safety First v. City of Ukiah*, the court held that the EIR inadequately described the energy impacts of a Costco project where the EIR relied on the project's compliance with energy conservation standards to conclude that energy consumption would be less than significant, and did not separately evaluate energy impacts from transportation, construction, or operation.[174] Here, the DEIR relies on the California Building Code and Title 24 energy efficiency standards, CALGreen code, green building practices, and a number of green building measures and design features, consistent with the Fresno General Plan and GHG Reduction strategy to support the less than significant determination.[175] However, as described above, additional analysis is necessary under the requirements of Appendix F to support a determination that the Project would not result in the wasteful, inefficient, and unnecessary consumption of energy during construction and operations.

B3-29 cont.

Therefore, the DEIR fails to comply with Appendix F energy analysis requirements.

F. The DEIR Fails to Disclose the Project's Inconsistencies with Land Use and Planning Laws and Regulations

Pursuant to Appendix G of the CEQA Guidelines, a project will have a significant adverse environmental impact on land use and planning if it will cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.[176] Here, the DEIR fails to disclose inconsistency with the City's General Plan which result in a significant adverse environmental impact on land use and planning.

B3-30

1. The DEIR Fails to Disclose the Project's Inconsistencies with the Noise Element of the City's General Plan

Under California law, a general plan serves as a "charter for future development"[177] and embodies "fundamental land use decisions that guide the

B3-31

[174] *Ukiah Citizens for Safety First v. City of Ukiah* (2016) 248 Cal. App. 4th 256, 263-266.
[175] DEIR, p. 4.5-11.
[176] CEQA Guidelines, Appendix G §X(b).
[177] *Lesher Communications, Inc. v. City of Walnut Creek* (1990) 52 Cal.3d 531, 54.

future growth and development of cities and counties."[178] The general plan has been aptly described as "the constitution for all future developments" within a city or county.[179] Further, the "propriety of virtually any local decision affecting land use and development depends upon consistency with the applicable general plan and its elements."[180] The consistency doctrine has been described as the "linchpin of California's land use and development laws; it is the principle which infuses the concept of planned growth with the force of law."[181]

The City of Fresno's General Plan Noise Element includes objectives and policies that work to protect the citizens of the City from the harmful and annoying effects of exposure to excessive noise. The Noise Element includes the following policy to guide development:

> **NS-1-a** Desirable and Generally Acceptable Exterior Noise Environment. Establish 65 dBA Ldn or CNEL as the standard for the desirable maximum average exterior noise levels for defined usable exterior areas of residential and noise sensitive uses for noise, but designate 60 dBA Ldn or CNEL (measured at the property line) for noise generated by stationary sources impinging upon residential and noise sensitive uses. Maintain 65 dBA Ldn or CNEL as the maximum average exterior noise levels for non-sensitive commercial land uses, and maintain 70 dBA Ldn or CNEL as maximum average exterior noise level for industrial land uses, both to be measured at the property line of parcels where noise is generated which may impinge on neighboring properties.[182]

B3-31 cont.

As demonstrated above, the Project will result in significant noise impacts during Project operation that will violate Policy NS-1-a. Mr. Watry provides substantial evidence that the Project will exceed the desirable and generally acceptable noise thresholds established in Policy NS-1-a, and as a result, the DEIR fails to demonstrate consistency with the General Plan.

VI. THE DEIR FAILS TO CONSIDER THE OFFICE OF THE ATTORNEY GENERAL'S BEST PRACTICES AND MITIGATION MEASURES FOR WAREHOUSE PROJECTS

In September 2022, the California Office of the Attorney General ("OAG") released an updated version of its guidance document titled "*Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act*" ("Best Practices").[183] The Best Practices were developed to aid local agencies to achieve CEQA compliance, and promote environmentally-just development when they are considering warehouse project proposals.[184] The OAG developed the Best Practices based on knowledge gained from monitoring, providing comments on, and litigating, warehouse development projects in California.[185] The Best Practices state that while CEQA analysis is necessarily project-specific, the document provides feasible best practices and mitigation measures which were adapted from actual warehouse projects in California.[186] The purpose of the Attorney General's guidance is to ensure that warehouse projects reduce their individual and cumulative impacts on the communities in which they are located to the greatest extent feasible.

B3-32

The Best Practices provides examples of environmentally superior methods of developing warehouse projects and offers sample mitigation measures that a local agency should consider when faced with a project such as the Project proposed here. For example, the Best Practices encourage local governing bodies to proactively plan for logistics projects by establishing industrial districts near major highway and rail corridors but away from sensitive receptors in order to help attract investment while avoiding conflicts between warehouse facilities and residential communities.[187]

Here, the proposed Project defies many of the recommendations in the Best Practices. For example:

- Per CARB guidance, siting warehouse facilities so that their property lines are at least 1,000 feet from the property lines of the nearest sensitive receptors.

[183] California Office of the Attorney General, Warehouse Projects: Best Practices and Mitigation Measures to Comply with the California Environmental Quality Act (hereinafter "Best Practices") (September 2022) available at https://oag.ca.gov/system/files/media/warehouse-best-practices.pdf
[184] Best Practices, p. 1.
[185] Best Practices, p. 1
[186] Best Practices, p. 1.
[187] Best Practices, p. 3.

- Placing facility entry and exit points from the public street away from sensitive receptors, e.g., placing these points on the north side of the facility if sensitive receptors are adjacent to the south side of the facility.[188]

As noted above, the closest receptor is 110 feet to the south of the project site, considerably closer than what is recommended by the Best Practices. Additionally, the entry and exit point to the Project site on Nielsen Avenue faces the sensitive receptors to the south, increasing the likelihood of causing significant impacts to those receptors.

The Best Practices also recommend that local jurisdictions take care when considering potential impacts from air quality and GHG emissions from project construction and operation. The DEIR does not comply with many of the recommendations and fails to include mitigation measures that conform with the Best Practices, which for construction include:

- Requiring off-road construction equipment to be zero-emission, where available, and all diesel-fueled off-road construction equipment, to be equipped with CARB Tier IV-compliant engines or better, and including this requirement in applicable bid documents, purchase orders, and contracts, with successful contractors demonstrating the ability to supply the compliant construction equipment for use prior to any ground-disturbing and construction activities.
- Prohibiting grading on days with an Air Quality Index forecast of greater than 100 for particulates or ozone for the project area.
- Limiting the amount of daily grading disturbance area.
- Providing electrical hook ups to the power grid, rather than use of diesel-fueled generators, for electric construction tools, such as saws, drills and compressors, and using electric tools whenever feasible.[189]

B3-32 cont.

For operational air quality and GHG emissions impacts, the Best Practices recommend:

- Requiring all heavy-duty vehicles entering or operated on the project site to be zero-emission beginning in 2030.
- Requiring on-site equipment, such as forklifts and yard trucks, to be electric with the necessary electrical charging stations provided.

[188] Best Practices, p. 6.
[189] Best Practices, p. 8.

- Requiring tenants to use zero-emission light- and medium-duty vehicles as part of business operations.
- Forbidding trucks from idling for more than two minutes and requiring operators to turn off engines when not in use.

The DEIR fails to demonstrate conformance with any of the above recommendations. The Best Practices also include several recommendations and suggested mitigation measures regarding warehouse noise and transportation impacts that the DEIR fails to take into account.

B3-32 cont.

The City must consider all of the recommendations of the OAG and incorporate any feasible measures recommended in the Best Practices as mitigation measures in the DEIR to further reduce the Project's potentially significant air quality, GHG emissions, transportation, energy, and noise impacts.

VII. THE CITY CANNOT MAKE THE FINDINGS REQUIRED FOR PROJECT APPROVAL

The Project requires approval of a Development Permit and a Tentative Parcel Map by the City. Pursuant to the Fresno City Code ("Code") the City Planning Director ("Director") has the authority to approve, conditionally approve, or deny the Project's applications based on specific sets of findings applicable to each permit.[190] In order to approve the Development Permit for the Project, the Director must find that the Project is consistent with the following:

B3-33

1. The applicable standards and requirements of [the City] Code.
2. The [City's] General Plan and any operative plan or policies the City has adopted.
3. Any applicable design guidelines adopted by the City Council.
4. Any approved Tentative Map, Conditional Use Permit, Variance, or other planning or zoning approval that the project required.
5. Fresno County Airport Land Use Compatibility Plan (as may be amended) adopted by the Fresno County Airport Land Use Commission pursuant to California Public Utilities Code Sections 21670—21679.5.[191]

[190] Fresno City Code ("FCC") § 15-5203 (Development Permit); *see also* FCC § 15-3308 (Tentative Parcel Map).
[191] FCC § 15-5206.

Additionally, pursuant to the Code, the Director may approve or conditionally approve a Tentative Parcel Map based on the following findings:

1. The proposed subdivision, together with the provisions for its design and improvement, is consistent with the General Plan, any applicable operative plan, adopted policies or guidelines, and the Municipal Code.
2. A subdivision for which a Tentative Map is required shall provide pursuant to the Map Act (Section 66473.1), to the extent feasible, for future passive or natural heating or cooling opportunities in the subdivision.
3. Water will be available and sufficient to serve a proposed subdivision with more than 500 dwelling units in accordance with the Map Act (Section 66473.7).
4. There exists sufficient infrastructure capacity for water, runoff, storm water, wastewater, and solid waste systems to serve the proposed subdivision. In cases where existing infrastructure is found to be deficient, plans shall show how sufficient capacity will be provided.
5. The proposed subdivision is compliant with the City of Fresno Floodplain Management Ordinance and the State of California Code of Regulations Title 23, as well as any other applicable State or federal law.[192]

B3-33 cont.

The City cannot make all of the above findings for the Project, thereby precluding approval of the Project's land use permits. As demonstrated in the foregoing comments, the Project is inconsistent with the General Plan's Noise and Safety Element. Therefore, the Director cannot find that the Project is consistent with the General Plan, precluding finding No. 2 for the Development Permit and Finding No. 1 of the Tentative Parcel Map and cannot make the necessary findings to approve the Project's entitlements until the deficiencies in the DEIR are corrected.

VIII. THE PROJECT FAILS TO COMPLY WITH THE SUBDIVISION MAP ACT

B3-34

As explained above, the Project requires the approval of a Tentative Parcel Map to subdivide the existing two parcels into four parcels.[193]

[192] FCC § 15-3309.
[193] DEIR, pg. 3-13.

The DEIR fails to analyze this component of the Project. The DEIR therefore lacks substantial evidence to support the Map Act's required factual findings to approve the Tentative Parcel Map, which require the City to find that a proposed subdivision is consistent with the general plan/specific plan, and does not have any detrimental environmental or public health effects.[194] In addition, as discussed above, there is substantial evidence demonstrating that the Project is likely to have, potentially significant impacts related to transportation, air quality, health risk, GHG emissions, noise, energy, and land use and planning. These impacts are not adequately mitigated in the DEIR. As a result of these unmitigated impacts, the Project fails to comply with mandatory Map Act requirements and the City cannot make the requisite findings to approve the Project's Tentative Parcel Map.

The purpose of the Map Act is to regulate and control design and improvement of subdivisions with proper consideration for their relation to adjoining areas, to require subdividers to install streets and other improvements, to prevent fraud and exploitation, and to protect both the public and purchasers of subdivided lands.[195] Before approving a tentative map, the Map Act requires the agency's legislative body to make findings that the proposed subdivision map, together with the provisions for its design and improvement, is consistent with the general plan and any specific plan.[196] The Map Act also requires the agency's legislative body to deny a proposed subdivision map in any of the following circumstances:[197]

B3-34 cont.

a) The proposed map is ***not consistent with applicable general and specific plans*** as specified in Section 65451.
b) The design or improvement of the proposed subdivision is ***not consistent with applicable general and specific plans***.
c) The site is not physically suitable for this type of development.
d) The site is not physically suitable for the proposed density of development.
e) The ***design of the subdivision or the proposed improvements are likely to cause substantial environmental damage*** or substantially and avoidably injure fish or wildlife or their habitat.
f) The ***design of the subdivision or type of improvements is likely to cause serious public health problems***.

[194] Gov Code §§66473.5, 66474.
[195] *Pratt v. Adams* (1964) 229 Cal.App.2d 602.
[196] Gov Code § 66473.5.
[197] Gov. Code § 66474 (emphasis added).

g) The design of the subdivision or the type of improvements will conflict with easements, acquired by the public at large, for access through or use of property within the proposed subdivision.

Residents' experts provide substantial evidence demonstrating that the Project is likely to have significant, unmitigated impacts to public health from exposure to Valley Fever causing fungus spores; on the environment and public health from construction and operational noise; and on the climate from excess GHG emissions and energy consumption. These impacts demonstrate that the Project, as analyzed in the DEIR, fails to comply with the General Plan, is "likely to cause substantial environmental damage," and "is likely to cause serious public health problems."[198] These unmitigated impacts render the Project inconsistent with Map Act requirements. The Map Act therefore requires the City to deny the Project's Tentative Parcel Map pursuant to Government Code Sections 66473.5 and 66474(a), (b), (e), and (f). B3-34 cont.

IX. CONCLUSION

For the foregoing reasons, we urge the City to fulfill its responsibilities under CEQA by preparing a legally adequate EIR that sufficiently addresses the potentially significant impacts described in this comment letter and the attached expert comments. A revised EIR is necessary to ensure that the Project's significant environmental impacts are mitigated to less than significant levels. B3-35

Thank you for your attention to these comments.

Sincerely,

Kevin Carmichael

Adams Broadwell Joseph & Cardozo
520 Capitol Mall, Suite 350
Sacramento, CA 95814

Attn: Mr. Kevin T. Carmichael

Subject: Comments On Draft Environmental Impact Report (DEIR) For Development Permit Application No. P21-02699 & Tentative Parcel Map No. P21-05930

Dear Mr. Carmichael:

At the request of Adams Broadwell Joseph & Cardozo (ABJC), Clark and Associates (Clark) has reviewed materials related to the February 2023 City of Fresno (the City) DEIR for the above referenced project.

Clark's review of the materials in no way constitutes a validation of the conclusions or materials contained within the plan. If we do not comment on a specific item this does not constitute acceptance of the item.

B3-36

Project Description:

According to the City's DEIR, Development Permit Application No. P21-02699 and Tentative Parcel Map No. P21-05930 was filed by Scannell Properties. The applicant proposes to construct four office/warehouse buildings with a total area of 901,438 square feet, as well as associated circulation, parking, and infrastructure improvements.

The buildings' exterior would be up to 44 feet high with an interior height of up to 36 feet and designed with a total of 201 loading dock doors on the north and south sides of the buildings. The four buildings would be comprised of the following: Building 1 would be 468,812 square feet and would provide 122 loading dock doors; Building 2 would be 248,786 square feet and would provide 46 loading

B3-37

Comment Letter B3 Attach.

dock doors; Building 3 would be 93,074 square feet and would provide 18 loading dock doors; and Building 4 would be 90,766 square feet and would provide 15 loading dock doors. The proposed project would also subdivide the project site into four separate parcels and would consist of each proposed building on a separate parcel. A total of 594 on-site parking spaces would be provided for vehicles and trucks. Of the 594 parking spaces, 385 spaces would be dedicated for standard vehicles, 11 spaces would be dedicated for accessible standard vehicles, and 10 spaces would be dedicated for accessible vans. The remaining 188 spaces would be dedicated for trailers and would be located along the eastern and western edges of the project site and would be located behind two 8-foot-tall gates, which would be installed to separate the general parking area from the truck storage and dock loading area.

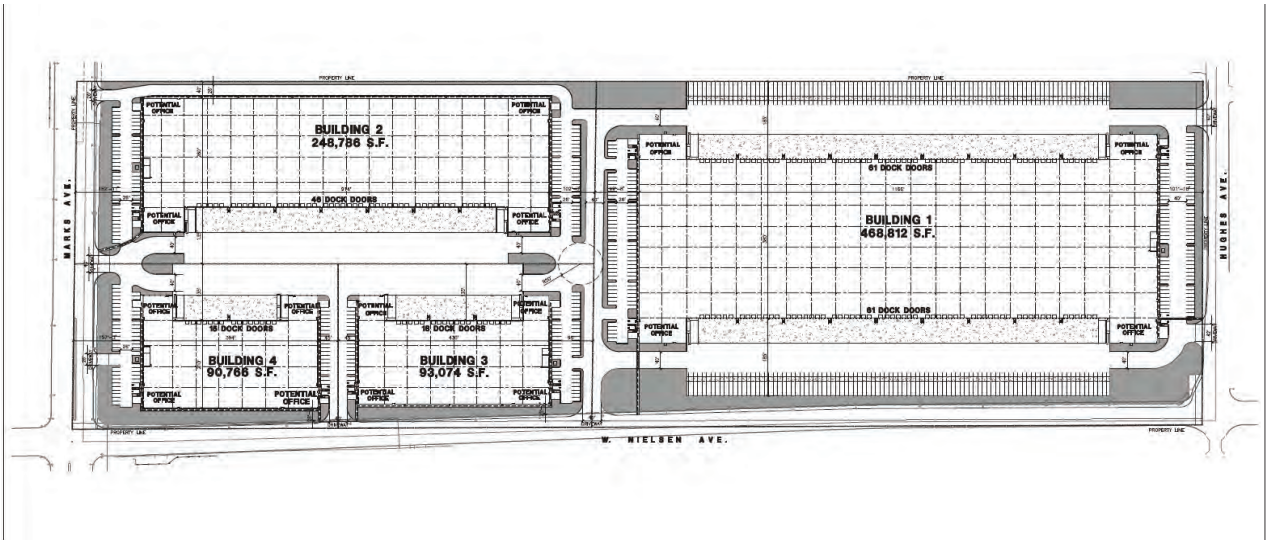

Figure 1: Project Site Plan

The 48.03-acre project site is currently vacant but formerly consisted of an industrial warehouse that has since been demolished. The project site is bounded to the north by partially developed land, to the east by North Hughes Avenue, to the south by West Nielsen Avenue, and to the west by North Marks Avenue. Regional access to the site is provided by State Route 180 (SR-180), which is located approximately 0.3 mile south of the project site, and State Route 99 (SR-99), which is located approximately 0.8 miles east of the project site.

B3-37 cont.

Comment Letter B3 Attach.

Figure 2: Site Vicinity Map

B3-37 cont.

The City's analysis assumes that the proposed project would be operational 24 hours per day, 7 days per week. A total of 594 on-site parking spaces would be provided for vehicles and trucks. Of

Comment Letter B3 Attach.

the 594 parking spaces, 385 spaces would be dedicated for standard vehicles, 11 spaces would be dedicated for accessible standard vehicles, and 10 spaces would be dedicated for accessible vans. The remaining 188 spaces would be dedicated for trailers and would be located along the eastern and western edges of the project site and would be located behind two 8-foot-tall gates, which would be installed to separate the general parking area from the truck storage and dock loading area.

B3-37 cont.

According to the conclusions of the DEIR, the proposed project is not expected to result in any significant unavoidable adverse impacts. The conclusion from the City that there will not be significant air quality impacts is not supported by the facts of the Project. There are substantial impacts that are not addressed in the City's analysis that must be addressed in a revised draft environmental impact report (RDEIR).

B3-38

Specific Comments:

1. The DEIR Fails To Address Impacts from Exposure to *Coccidiodes Immitis* (Valley Fever Cocci) From Particulate Matter Released From Site During Construction Activities of The Project.

The DEIR fails to adequately address the known presence/issue of *Coccidiodes Immitis* (Valley Fever Cocci) in the Fresno, California area. Dust exposure is one of the primary risk factors for contracting Valley Fever (via *Coccidiodes imimitis (cocci)* exposure). When soil containing the *cocci* spores are disturbed by construction activities, the fungal spores become airborne, exposing construction workers and other nearby sensitive receptors.

B3-39

The fungus lives in the top 2 to 12 inches of soil. When soil containing this fungus is disturbed by activities such as digging, vehicles, construction activities, dust storms, or during earthquakes, the fungal spores become airborne. According to the Air Quality Analysis of the DEIR (Appendix C), the project will involve 40 days of site preparation which will disturb 60 acres of soil and 40 days of grading activities which will disturb 120 acres of soil.

B3-39 cont.

The most at-risk populations are construction and agricultural workers.[1] Construction workers are the very population that would be most directly exposed by the Project. A refereed journal article on occupational exposures notes that "[l]abor groups where occupation involves close contact with the soil are at greater risk, especially if the work involves dusty digging operations."[2]

The potentially exposed population in surrounding areas is much larger than construction workers because the nonselective raising of dust during Project construction will carry the very small spores, 0.002–0.005 millimeters ("mm"), into nonendemic areas, potentially exposing large non-Project-related populations.[3],[4] These very small particles are not controlled by conventional construction dust control mitigation measures.

[2] *Ibid.*, p. 110.

[3] Schmelzer and Tabershaw, 1968, p. 110; Pappagianis and Einstein, 1978

[4] Pappagianis and Einstein, 1978, p. 527 ("The northern areas were not directly affected by the ground level windstorm that had struck Kern County but the dust was lifted to several thousand feet elevation and, borne on high currents, the soil and arthrospores along with some moisture were gently deposited on sidewalks and automobiles as 'a mud storm' that vexed the residents of much of California." The storm originating in Kern County, for example, had major impacts in the San Francisco Bay Area and Sacramento).

Comment Letter B3 Attach.

Since 2014, the number of cases of Valley Fever in Fresno County has increased from 161 in 2014 to 828 in 2017, as reported by the California Department of Public Health (CDPH).[5] In 2022, 450 cases were recorded in Fresno County,[6] almost three times (2.8 times exactly) as many as the amounts reported in 2014. In the first quarter of 2023, Fresno County reported 83 cases.

B3-39 cont.

2. The DEIR Fails To Include Adequate Mitigation Measures And Medical Monitoring Information To Prevent Exposure to *Coccidiodes Immitis* (Valley Fever Cocci) From Disturbed Soils On Site.

Standard fugitive dust mitigation measures are not adequate to protect construction workers and nearby sensitive receptors from this risk. In addition to the mitigation measures required under the DEIR's Mitigation Measure Air-1, the City should require the following measures from the Proponent to actively suppress the spread of VF by:

1. Include specific requirements in the Project's Injury and Illness Prevention Program (as required by Title 8, Section 3203) regarding safeguards to prevent Valley Fever.

B3-40

2. Control dust exposure:
   - Apply chemical stabilizers at least 24-hours prior to high wind event;
   - Apply water to all disturbed areas a minimum of three times per day. Watering frequency should be increased to a minimum of four times per day if there is any evidence of visible wind-driven fugitive dust;
   - Provide National Institute for Occupational Safety and Health (NIOSH)-approved respirators for workers with a prior history of Valley Fever.
   - Half-face respirators equipped with a minimum N-95 protection factor for use during worker collocation with surface disturbance activities. Half-face

Surveillance and Statistics Section, Infection Diseases Branch, Division of Communicable Disease Control, Center For Infectious Diseases, California Department of Public Health. https://www.cdph.ca.gov/Programs/CID/DCDC/CDPH%20Document%20Library/CocciEpiSummary2019.pdf

[6] CDPH. 2023. Coccidiodomycosis In California, Provisional Monthly Report, January – March 2023 (as of March 31, 2023). Surveillance and Statistics Section, Infection Diseases Branch, Division of Communicable Disease Control, Center For Infectious Diseases, California Department of Public Health. https://www.cdph.ca.gov/Programs/CID/DCDC/CDPH%20Document%20Library/CocciinCAProvisionalMonthlyReport.pdf

Comment Letter B3 Attach.

respirators equipped with N-100 or P-100 filters should be used during digging activities. Employees should wear respirators when working near earth-moving machinery.

- Prohibit eating and smoking at the worksite, and provide separate, clean eating areas with hand-washing facilities.
- Avoid outdoor construction operations during unusually windy conditions or in dust storms.
- Consider limiting outdoor construction during the fall to essential jobs only, as the risk of cocci infection is higher during this season.

3. Prevent transport of cocci outside endemic areas:
   - Prevent spillage or loss of bulk material from holes or other openings in the cargo compartment's floor, sides, and/or tailgate;
   - Provide workers with coveralls daily, lockers (or other systems for keeping work and street clothing and shoes separate), daily changing and showering facilities.
   - Clothing should be changed after work every day, preferably at the work site.
   - Train workers to recognize that cocci may be transported offsite on contaminated equipment, clothing, and shoes; alternatively, consider installing boot-washing.
   - Post warnings onsite and consider limiting access to visitors, especially those without adequate training and respiratory protection.
4. Improve medical surveillance for employees:
   - Employees should have prompt access to medical care, including suspected work-related illnesses and injuries.
   - Work with a medical professional to develop a protocol to medically evaluate employees who have symptoms of Valley Fever.
   - Consider preferentially contracting with 1-2 clinics in the area and communicate with the health care providers in those clinics to ensure that providers are aware that Valley Fever has been reported in the area. This will increase the likelihood that ill workers will receive prompt, proper and consistent medical care.
   - Respirator clearance should include medical evaluation for all new employees, annual re-evaluation for changes in medical status, and annual training, and fit-testing.

B3-40 cont.

Comment Letter B3 Attach.

- Skin testing is not recommended for evaluation of Valley Fever.[7]
- If an employee is diagnosed with Valley Fever, a physician must determine if the employee should be taken off work, when they may return to work, and what type of work activities they may perform.

B3-40 cont.

The mitigation measures identified in this comment, based on actual experience during construction of projects in endemic areas, should be required for the Project. The City must include concrete measures like the ones listed above in a revised DEIR of the Project.

3. The Air Quality Analysis Of Operational Emissions Is Incomplete And Fails To Include Emissions From The Fire Pump System That Will Be Installed Onsite.

According to the Air Quality Analysis prepared by LSA[8] for the Project, operational emissions were calculated using the CalEEMOD (Version 2020.4.0) software. Included in the analysis are area source emissions and mobile source emissions. Not included in the analysis are emissions from the fire flow pump system that will need to be installed for the buildings to be compliant with the California Fire Code (CFC) and local fire authority requirements.

B3-41

In the CalEEMOD outputs provided in the Appendix C to the DEIR prepared by LSA[9], no fire pump system is included in the analyses.

[7] Short-term skin tests that produce results within 48 hours are now available. See Kerry Klein, NPR for Central California, New Valley Fever Skin Test Shows Promise, But Obstacles Remain, November 21, 2016; available at http://kvpr.org/post/new-valley-fever-skin-test-shows-promise-obstacles-remain.

B3-41 cont.

The City's analysis is therefore incomplete and must be corrected in a revised DEIR for the Project.

4. The Project's Air Quality Analysis Is Incomplete And Fails To Adequately Consider The Use of Refrigeration Units and TRU's Onsite

According to the DEIR, the proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. The project is being built as a "spec" building whereby tenant(s) would perform the final improvements, while the proposed project would fully build the office spaces. The description provided does not preclude the use of the buildings as refrigerated/cold storage warehouses. Given the vague description of the Project end use, the City should include an analysis of the Project assuming that the buildings could be used for cold storage and should also include the use of Transport Refrigeration Units (TRUs) on site in the air quality analysis.

B3-42

Transport Refrigeration Units (TRU) are refrigeration systems powered by diesel internal combustion engines designed to refrigerate or heat perishable products that are transported in various containers, including truck vans, semi-truck trailers, shipping containers, and railcars. CARB[10] defines diesel exhaust as a complex mixture of inorganic and organic compounds that exists in gaseous, liquid, and solid phases. CARB and U.S. EPA identify 40 components of the exhaust as suspected human carcinogens, including formaldehyde, 1,3-butadiene, and benzo[a]pyrene. While acrolein is one of the most TAC in diesel exhaust it is not the only TAC. The inhalation unit risk factor identified by OEHHA for use in risk assessments is for the particulate matter (DPM) fraction

[10] CARB. 1998. Report to the Air Resources Board on the Proposed Identification of Diesel Exhaust as a Toxic Air Contaminant, Part A, Public Exposure To, Sources and Emissions of Diesel Exhaust In California. April 22, 1998. Pg A-1.

Comment Letter B3 Attach.

of diesel exhaust and not the vapor phase components identified by CARB and U.S. EPA.

Given the lack of a clear project description of the use of the Project Site, it is therefore reasonable to conclude that refrigeration units and TRUs are a foreseeable project component. The refrigeration units and TRU emissions have not been quantified in the DEIR, intentionally underestimating the foreseeable health risk to the community as well as the associated GHG emissions from the operation of the refrigeration units and TRUs. The City must assess the impacts since they are allowing for the potential future use of these sources of pollution onsite in a revised DEIR.

B3-42 cont.

5. The DEIR's Emission Estimates For Passenger Vehicles Is Different Than The Value Included In The Technical Appendices.

According to the DEIR, the proposed Project would result in a total of 1,920 vehicle trips per day. Of the 1,920 trips, there would be 1,578 car trips daily. The remaining 342 trips would be associated with trucks using the Project Site.

B3-43

Table 4.10.A: Project Trip Generation

Trip Generation[1]	Average Daily Trips	Weekday AM Peak Hour[2]			Weekday PM Peak Hour[2]		
		In	Out	Total	In	Out	Total

Source: LSA (2021).

[1] Rates from the Western Riverside Council of Governments (WRCOG) *TUMF High-Cube Warehouse Trip Generation Study*, January 2019, prepared by WSP.

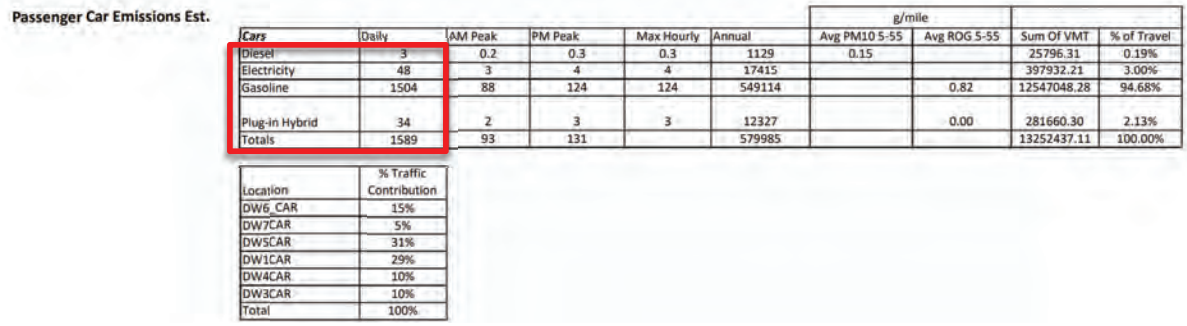
[2] The WRCOG study does not provide in/out splits for the peak hour trip generation. Therefore, in/out splits from Institute of Transportation Engineers (ITE) Trip Generation Manual (10th Edition) supplement Land Use 155 - "High-Cube Fulfilment Center Warehouse" have been used for obtaining in/out traffic.

[3] A Passenger Car Equivalent (PCE) factor 2.0 has been taken for 2-4 axle trucks based on Highway Capacity Manual (HCM) recommendations. Further, as a conservative approach, a PCE factor of 3.0 is taken, for 5+ axle trucks, consistent with latest practices in numerous California jurisdictions.

Figure 5: Daily Trip Estimation

Comment Letter B3 Attach.

A review of the underlying tables in Appendix C of the technical appendices shows that LSA assumed a different rate of trip generation. On page 227 of the pdf, the table for passenger vehicles shows a value of 1,589 passenger vehicles per day. [11]



Passenger Car Emissions Est.

Figure 6: Passenger Vehicle Estimates From Technical Appendices

The City must correct the numbers within the technical appendices and the DEIR to ensure there is consistency in the whole report. The City should provide those corrected results in a revised DEIR.

B3-43 cont.

5. **The Underlying Assumptions Regarding The Number of Vehicles Associated With Each Square Foot of Building Utilized In The Air Quality Analysis Under Estimates The Number of Daily Trips And Does Not Reflect The Range Of Values Reported By ITE.**

The choice of the daily trip rate has a profound impact on the calculated emissions for operational associated with the Project. The City's choice for the trip rate is at the lowest end of the values reported in the literature. The ITE manual includes a variety of average daily vehicle trips for HCWs which range from a low of 1.4 per 1,000 square feet for transload and short-term storage warehouses to a high of 6.44 trips per square feet for fulfillment center warehouses.[12] An averaged value of all the warehouse HCW types reported in the ITE manual would be 3.28 trips per 1,000 square

B3-44

[11] LSA. 2023. Public Review Draft Environmental Impact Report Technical Appendices – Volume I – Appendices A-I. 2740 West Nielsen Avenue Office/Warehouse Project, Fresno, California.

[12] Institute of Transportation Engineers (2020).

Comment Letter B3 Attach.

feet. The 2019 study of warehouse trip generation performed by WSP for the Western Riverside Council of Governments (WR-COG) cited in the DEIR, calculates an average daily trip rate across the 11 fulfillment centers of 2.13 per 1000 square feet, well below the average value for the ITE studies. The value reported in the WR-COG study is significantly lower than the average of the ITE studies (35% lower than the ITE average).

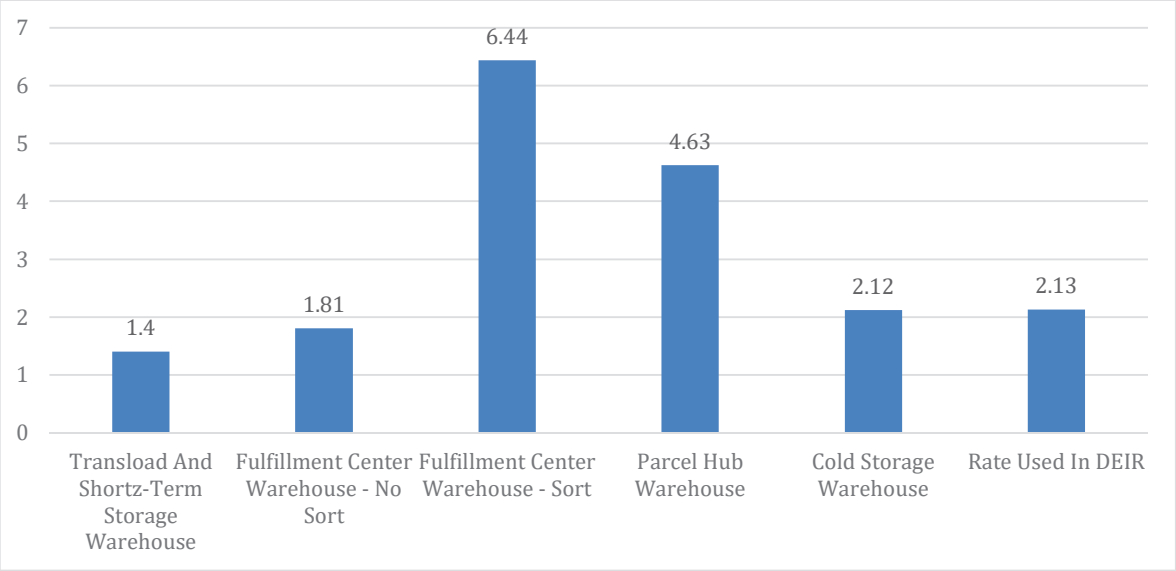

Figure 7: Trip rates per 1,000 square feet as reported in ITE manual

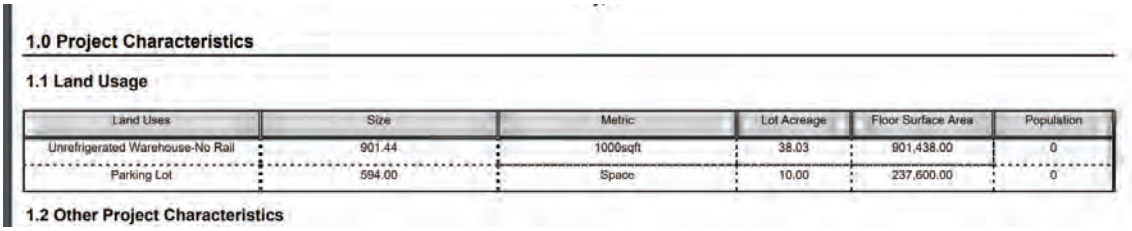

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Unrefrigerated Warehouse-No Rail	901.44	1000sqft	38.03	901,438.00	0
Parking Lot	594.00	Space	10.00	237,600.00	0

1.2 Other Project Characteristics

Figure 8: Project Description in CalEEMOD

Using the ITE manual rates above, the proposed 901,440 square foot HCW Project could result in 1,262.0 to 5,805.27 daily trips. The averaged value of the daily trips (assuming 3.28 trips per thousand feet on average) is 2,956.72 trips, nearly 1,000 more trips per day than those assumed in the DEIR.

B3-44 cont.

Comment Letter B3 Attach.

The ITE studies suggest that the value used to justify the number of vehicle trips per day utilized by the City are not supportable, and the DEIR lacks any supporting evidence to justify its reliance on a 2.13 daily trip rate. Based on the evidence and reasonable calculations provided in the ITE studies, the City should, at a minimum, re-evaluate the Project's operational emissions based on the average value reported by ITE (3.28) in a revised DEIR.

B3-44 cont.

6. The Air Dispersion Model Used For The Health Risk Assessment For Operational Phases Of The Project Has A Structural Flaw That Result In Inaccurate Estimates Of The Project Emissions Within The Community

The modeling approach has a significant flaw - the model does not account for the impact on emissions from building downwash. If the building downwash were included in the model, then the Proponent would be reasonably expected to call that out in the text summary of the model. The AERMOD model calculates the ground-level concentration of DPM emission associated with the project.

B3-45

Building downwash occurs as the wind flows over and around buildings and impacts the dispersion of pollution from nearby stacks. A plume caught in the path of this flow is drawn into the wake, temporarily trapping it in a recirculating cavity. This downwash effect leads to higher ground-level concentration of chemicals emitted from sources. The downwash effect increases as the relative difference between the release height and top of the building increases.[13] For the closest receptors to the site, the residences to the east of the Project, this difference will create an additional air quality impact that is not accounted for in the City's analysis. Guidance from authoritative bodies in California regarding the preparation of health risk assessments of mobile sources of diesel emissions[14] requires the inclusion of building heights and dimensions for building downwash calculations.

[13] The so-called good engineering practice height (GEP) of the source. The GEP is defined in Section 123 of the Clean Air Act as "the height necessary to ensure that emissions from a stack do not result in excessive concentrations of any air pollutant in the immediate vicinity of the source as a result of atmospheric downwash, eddies or wakes which may be created by the source itself, nearby structures or nearby terrain obstacles."

[14] SCAQMD. 2003. Health Risk Assessment Guidance For Analyzing Cancer Risks From Mobile Source Diesel Emissions. August, 2003. Page 2.

Comment Letter B3 Attach.

Omission of the building downwash effect underestimates the exposure point concentrations for receptors near the building(s). The City should address the impact of this issue in a R-DEIR. B3-45 cont.

7. The Air Quality Analysis Failed To Account For The Back-up Generator (BUG) Usage Onsite.

The DEIR's Air Quality Analysis does not account for the need for back-up generators on-site. Backup generators would only be used in the event of a power failure and would not be part of the Project's normal daily operations. In the CalEEMOD outputs provided in the Appendix C to the DEIR prepared by LSA[15], no BUGs are included in the analyses.

B3-46

Figure 9: CalEEMOD Output For Annual Operational Phase

The City's analysis is therefore incomplete and must be corrected in a revised DEIR for the Project.

In addition to the testing emissions the air quality analysis must include the substantial increase in operational emissions from BUGs in the Air Basin due to unscheduled events, including but not limited to Public Safety Power Shutoff (PSPS) events and extreme heat events. Extreme heat events are defined as periods where in the temperatures throughout California exceed 100 degrees Fahrenheit. The total duration of the PSPS events lasted between 141 hours to 154 hours in 2019. In 2021, the Governor Of California declared that during extreme heat events the use of stationary generators shall be deemed an emergency use under California Code of Regulations (CCR), title 17, section 93115.4 sub. (a) (30) (A)(2). The number of Extreme Heat Events is likely to increase in California with the continuing change in climate the State is currently undergoing.

[15] LSA. 2023. Public Review Draft Environmental Impact Report Technical Appendices – Volume I – Appendices A-I. 2740 West Nielsen Avenue Office/Warehouse Project, Fresno, California.

Comment Letter B3 Attach.

Power produced during PSPS or extreme heat events is expected to come from engines regulated by CARB and California's 35 air pollution control and air quality management districts (air districts). Of particular concern are health effects related to emissions from diesel back-up engines. Diesel particulate matter (DPM) has been identified as a toxic air contaminant, composed of carbon particles and numerous organic compounds, including over forty known cancer-causing organic substances. The majority of DPM is small enough to be inhaled deep into the lungs and make them more susceptible to injury.

According to the California Public Utilities Commission (CPUC) de-energization report in October 2019, there were almost 806 PSPS events (emphasis added) that impacted almost 973,000 customers (~7.5% of households in California) of which ~854,000 of them were residential customers, and the rest were commercial/industrial/medical baseline/other customers. CARB's data also indicated that on average each of these customers had about 43 hours of power outage in October 2019. Using the actual emission factors for each diesel BUG engines in the air district's stationary BUGs database, CARB staff calculated that the 1,810 additional stationary generators running during a PSPS in October 2019 generated 126 tons of NOx, 8.3 tons or particulate matter, and 8.3 tons of DPM.

B3-46 cont.

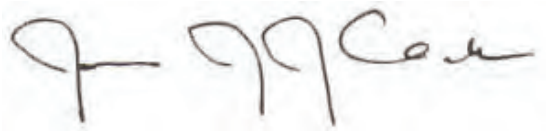
For every PSPS or Extreme Heat Event (EHE) triggered during the operational phase of the project, significant concentrations of DPM will be released. A R-DEIR should be prepared for the Project that includes an analysis of the operation of BUGs that will occur at the project site that are not accounted for in the current air quality and GHG analyses.

Conclusion

The facts identified and referenced in this comment letter lead me to reasonably conclude that the Project could result in significant unmitigated impacts if the DEIR is approved. The City must re-evaluate the significant impacts identified in this letter by requiring the preparation of a revised draft environmental impact report.

B3-47

Sincerely,



Comment Letter

James J. J. Clark, Ph.D.

Principal Toxicologist

Toxicology/Exposure Assessment Modeling

Risk Assessment/Analysis/Dispersion Modeling

Education:

Ph.D., Environmental Health Science, University of California, 1995

M.S., Environmental Health Science, University of California, 1993

B.S., Biophysical and Biochemical Sciences, University of Houston, 1987

Professional Experience:

Dr. Clark is a well-recognized toxicologist, air modeler, and health scientist. He has 30 years of experience in researching the effects of environmental contaminants on human health including environmental fate and transport modeling (SCREEN3, AEROMOD, ISCST3, Johnson-Ettinger Vapor Intrusion Modeling, RESRAD, GENII); exposure assessment modeling (partitioning of contaminants in the environment as well as PBPK modeling); conducting and managing human health risk assessments for regulatory compliance and risk-based clean-up levels; and toxicological and medical literature research.

SELECTED AIR MODELING RESEARCH/PROJECTS

Client(s) - Confidential

Dr. Clark performed a historical dose reconstruction for community members from an active 700 acre petroleum refinery in Los Angeles. The analysis included a multi-year dispersion model was performed in general accordance with the methods outlined by the U.S. EPA and the SCAQMD for assessing the health impacts in Torrance, California. The results of the analysis are being used as the basis for injunctive relief for the communities surrounding the refinery.

B3-48

Client(s) – Multiple

Indoor Air Evaluations, California: Performed multiple indoor air screening evaluations and risk characterizations consistent with California Environmental Protection Agency's (Cal/EPA) Department of Toxic Substances Control (DTSC) and Regional Water Quality Control Board (RWQCB) methodologies. Characterizations included the use of DTSC's

modified Johnson & Ettinger Model and USEPA models, as well as the attenuation factor model currently advocated by Cal/EPA's Office of Environmental Health and Hazard Assessment (OEHHA).

Client – Adams, Broadwell, Joseph Cardozo, P.C.

Dr. Clark has performed numerous air quality analyses and risk assessments of criteria pollutants, air toxins, and particulate matter emissions for sites undergoing evaluation via the California Environmental Quality Act (CEQA) process. The analyses include the evaluation of Initial Study (IS) and Environmental Impacts Reports (EIR) for each project to determine the significance of air quality, green house gas (GHG), and hazardous waste components of the projects. The analyses were compiled as comment letters for submittal to oversight agencies.

Client – Confidential

Dr. Clark performed a comprehensive evaluation of criteria pollutants, air toxins, and particulate matter emissions from a carbon black production facility to determine the impacts on the surrounding communities. The results of the dispersion model were used to estimate acute and chronic exposure concentrations to multiple contaminants and were be incorporated into a comprehensive risk evaluation.

B3-48 cont.

Client – Confidential

Dr. Clark performed a comprehensive evaluation of air toxins and particulate matter emissions from a railroad tie manufacturing facility to determine the impacts on the surrounding communities. The results of the dispersion model have been used to estimate acute and chronic exposure concentrations to multiple contaminants and have been incorporated into a comprehensive risk evaluation.

PUBLIC HEALTH/TOXICOLOGY

Client: Confidential

Dr. Clark performed a historical dose reconstruction for community members from radiologically impacted material (RIM) releases from an adjacent landfill. The analysis was performed in general accordance with the methods outlined by the Agency for Toxic Substances Control (ATSDR) for assessing radiation doses from historical source areas in North St. Louis County, Missouri.

Client: City of Santa Clarita, Santa Clarita, California

Dr. Clark managed the oversight of the characterization, remediation and development activities of a former 1,000 acre munitions manufacturing facility for the City of Santa

Clarita. The site is impacted with a number of contaminants including perchlorate, unexploded ordinance, and volatile organic compounds (VOCs). The site is currently under a number of regulatory consent orders, including an Immanent and Substantial Endangerment Order. Dr. Clark assisted the impacted municipality with the development of remediation strategies, interaction with the responsible parties and stakeholders, as well as interfacing with the regulatory agency responsible for oversight of the site cleanup.

Client: Confidential

Dr. Clark performed a historical dose reconstruction for community members exposed to radioactive waste released into the environment from legacy storage facilities. The releases resulted in impacts to soils, sediments, surface waters, and groundwater in the vicinity of the sites. The analysis was performed in general accordance with the methods outlined by the Agency for Toxic Substances Control (ATSDR) for assessing radiation doses from historical source areas in the community.

Client: Confidential

Dr. Clark performed a dose assessment of an individual occupationally exposed to metals and silica from fly ash who later developed cancer. A review of the individual's medical and occupational history was performed to prepare opinions regarding his exposure and later development of cancer.

B3-48 cont.

Client: Brayton Purcell, Novato, California

Dr. Clark performed a toxicological assessment of residents exposed to methyl-tertiary butyl ether (MTBE) from leaking underground storage tanks (LUSTs) adjacent to the subject property. The symptomology of residents and guests of the subject property were evaluated against the known outcomes in published literature to exposure to MTBE. The study found that residents had been exposed to MTBE in their drinking water; that concentrations of MTBE detected at the site were above regulatory guidelines; and, that the symptoms and outcomes expressed by residents and guests were consistent with symptoms and outcomes documented in published literature.

Client: Confidential

Dr. Clark performed a toxicological assessment of an individual occupationally exposed to hexavalent chromium who later developed cancer. A review of the individual's medical and occupational history was performed to prepare opinions regarding her exposure and later development of cancer.

Comment Letter B3 Attach.

Client: Covanta Energy, Westwood, California

Evaluated health risk from metals in biosolids applied as soil amendment on agricultural lands. The biosolids were created at a forest waste cogeneration facility using 96% whole tree wood chips and 4 percent green waste. Mass loading calculations were used to estimate Cr(VI) concentrations in agricultural soils based on a maximum loading rate of 40 tons of biomass per acre of agricultural soil. The results of the study were used by the Regulatory agency to determine that the application of biosolids did not constitute a health risk to workers applying the biosolids or to residences near the agricultural lands.

Client: Kaiser Venture Incorporated, Fontana, California

Prepared PBPK assessment of lead risk of receptors at a 1,100-acre former steel mill. This evaluation was used as the basis for granting closure of the site by lead regulatory agency.

RISK ASSESSMENTS/REMEDIAL INVESTIGATIONS

Kaiser Ventures Incorporated, Fontana, California

Prepared health risk assessment of semi-volatile organic chemicals and metals for a fifty-year old wastewater treatment facility used at a 1,100-acre former steel mill. This evaluation was used as the basis for granting closure of the site by lead regulatory agency.

B3-48 cont.

ANR Freight - Los Angeles, California

Prepared a comprehensive Preliminary Endangerment Assessment (PEA) of petroleum hydrocarbon and metal contamination of a former freight depot. This evaluation was as the basis for reaching closure of the site with lead regulatory agency.

Kaiser Ventures Incorporated, Fontana, California

Prepared comprehensive health risk assessment of semi-volatile organic chemicals and metals for 23-acre parcel of a 1,100-acre former steel mill. The health risk assessment was used to determine clean up goals and as the basis for granting closure of the site by lead regulatory agency. Air dispersion modeling using ISCST3 was performed to determine downwind exposure point concentrations at sensitive receptors within a 1 kilometer radius of the site. The results of the health risk assessment were presented at a public meeting sponsored by the Department of Toxic Substances Control (DTSC) in the community potentially affected by the site.

Subject: **2740 West Nielsen Avenue Office/Warehouse Project**
Fresno, California
Review and Comment on Draft EIR Noise Analysis

Dear Mr. Carmichael,

In June of last year, we reviewed and commented upon the noise impact analysis in the following document:

Mitigated Negative Declaration for Development Permit Application No. P21-02699 & Tentative Parcel Map No P21-05930 ("MND")
Project Address: 2740 West Nielsen Avenue, Fresno, California
City of Fresno, Planning and Development Department
May 13, 2022

Subsequently, the City of Fresno had the consulting firm LSA prepare a Draft Environmental Impact Report for this project:

Public Review Draft Environmental Impact Report ("DEIR")
2740 West Nielsen Avenue Office/Warehouse Project
LSA Project No. SNN2102
February 2023

This letter reports our comments on the noise analysis in the DEIR.

B3-49

Wilson Ihrig, Acoustical Consultants, has practiced exclusively in the field of acoustics since 1966. During our 57 years of operation, we have prepared hundreds of noise studies for Environmental Impact Reports and Statements. We have one of the largest technical laboratories in the acoustical consulting industry. We also utilize industry-standard acoustical programs such as Environmental Noise Model (ENM), Traffic Noise Model (TNM), Roadway Construction Noise Model (RCNM), SoundPLAN, and CADNA. In short, we are well qualified to prepare environmental noise studies and review studies prepared by others.

B3-50

Adverse Effects of Noise[1]

Although the health effects of noise are not taken as seriously in the United States as they are in other countries, they are real and, in many parts of the country, pervasive.

Noise-Induced Hearing Loss. If a person is repeatedly exposed to loud noises, he or she may experience noise-induced hearing impairment or loss. In the United States, both the Occupational Health and Safety Administration (OSHA) and the National Institute for Occupational Safety and Health (NIOSH) promote standards and regulations to protect the hearing of people exposed to high levels of industrial noise.

Speech Interference. Another common problem associated with noise is speech interference. In addition to the obvious issues that may arise from misunderstandings, speech interference also leads to problems with concentration fatigue, irritation, decreased working capacity, and automatic stress reactions. For complete speech intelligibility, the sound level of the speech should be 15 to 18 dBA higher than the background noise. Typical indoor speech levels are 45 to 50 dBA at 1 meter, so any noise above 30 dBA begins to interfere with speech intelligibility. The common reaction to higher background noise levels is to raise one's voice. If this is required persistently for long periods of time, stress reactions and irritation will likely result. The problems and irritation that are associated with speech disturbance have become more pronounced during the COVID-19 pandemic because many people find themselves and the people they live with trying to work and learn simultaneously in spaces that were not designed for speech privacy.

B3-51

Sleep Disturbance. Noise can disturb sleep by making it more difficult to fall asleep, by waking someone after they are asleep, or by altering their sleep stage, e.g., reducing the amount of rapid eye movement (REM) sleep. Noise exposure for people who are sleeping has also been linked to increased blood pressure, increased heart rate, increase in body movements, and other physiological effects. Not surprisingly, people whose sleep is disturbed by noise often experience secondary effects such as increased fatigue, depressed mood, and decreased work performance.

Cardiovascular and Physiological Effects. Human's bodily reactions to noise are rooted in the "fight or flight" response that evolved when many noises signaled imminent danger. These include increased blood pressure, elevated heart rate, and vasoconstriction. Prolonged exposure to acute noises can result in permanent effects such as hypertension and heart disease.

Impaired Cognitive Performance. Studies have established that noise exposure impairs people's abilities to perform complex tasks (tasks that require attention to detail or analytical processes) and it makes reading, paying attention, solving problems, and memorizing more difficult. This is why there are standards for classroom background noise levels and why offices and libraries are designed to provide quiet work environments. While sheltering-in-place during the COVID-19 pandemic, many people are finding working and learning more difficult because their home environment is not as quiet as their office or school was.

[1] More information on these and other adverse effects of noise may be found in *Guidelines for Community Noise*, eds B Berglund, T Lindvall, and D Schwela, World Health Organization, Geneva, Switzerland, 1999. (https://www.who.int/docstore/peh/noise/Comnoise-1.pdf)

Comments on Operational Noise Analysis – Traffic Noise

Our comments on the MND may succinctly be summarized as:

1. The MND failed to account for truck noise from the proposed facility, and
2. The MND selectively chose which City policy to use to establish thresholds of significance, thereby potentially failing to identify some significant impact.

B3-52

The DEIR corrects the first failing, and, in doing so, substantiates the second failing.

Policy NS-1-a of Fresno General Plan, Chapter 9, Noise and Safety, states:

> **Desirable and Generally Acceptable Exterior Noise Environment.** Establish 65 dBA Ldn or CNEL as the standard for the desirable maximum average exterior noise levels for defined usable exterior areas of residential and noise-sensitive uses . . .[2]

It is very important that cities like Fresno adopt absolute standards for the noise environments of their citizens because if only relative standards are used – like the sole standard adopted by the DEIR – then there would literally be no limit to environmental noise exposure over time. Such a notion clearly runs contrary to the spirit of CEQA.

The DEIR adopts as the significance criteria for traffic noise a relative increase of 3.0 dBA CNEL, and it concludes that the residences along Nielsen Avenue will not be significantly impacted by project noise because the increase will be, at most, 2.1 dBA CNEL. [DEIR at p. 4.9-21] The obvious fallacy of this analysis is that if the project wanted to expand its operations, say, 5 years after it becomes operational, the next DEIR could adopt this same threshold, the noise could increase by another 2.1 dBA CNEL (the baseline being "reset" to the then-prevalent conditions), and that would also be deemed a less-than-significant impact despite the 4.2 dBA CNEL increase relative to today's current conditions. The continual use of a relative threshold enables piecemealing project development with significant long-term impacts that evade identification.

B3-53

The obvious way to close this loophole in the application of CEQA is to adopt an absolute threshold in conjunction with, not in lieu of, a relative threshold. Caltrans recognizes the need for both types of standards when determining impacts:

> Traffic noise impacts as defined in 23CFR772.5 occur when the predicted noise level in the design year approaches or exceeds the Noise Abatement Criteria (NAC) specified in 23CFR772, or a predicted noise level substantially exceeds the existing noise level (a "substantial" noise increase).[3]

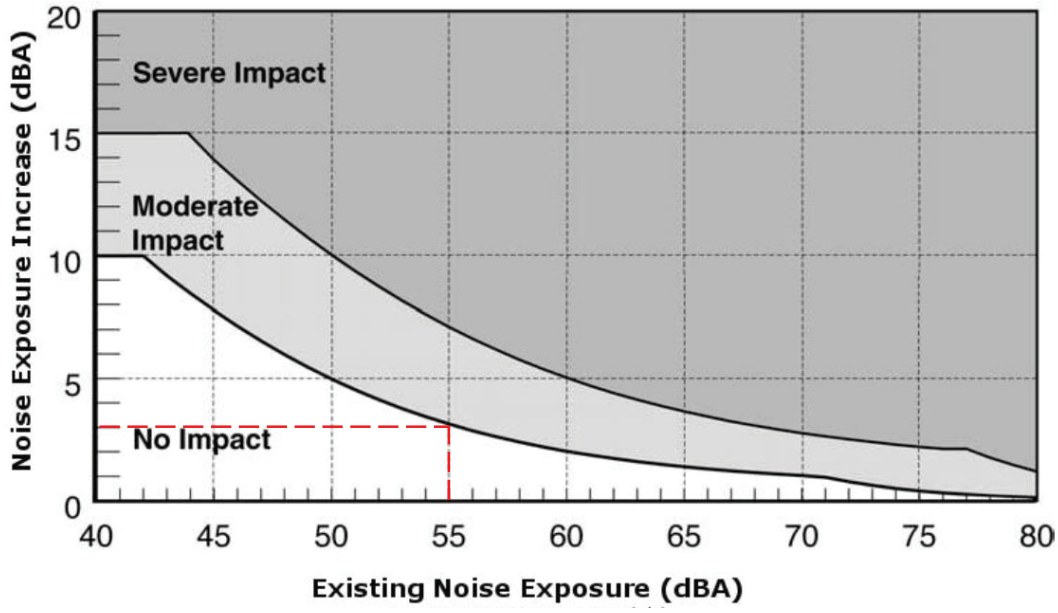
---

[2] The *day-night average sound level* (Ldn) is a 24-hour weighted average that incorporates a 10 dBA penalty during the night hours (10 p.m. to 7 a.m.) to account for the heighted sensitivity of people to noise during the night. The *community noise exposure level* (CNEL) additionally includes a 5 dBA penalty during the evening hours (7 p.m. to 10 p.m.). For transportation-dominated environments, the Ldn and CNEL are very similar, with the CNEL typically being higher than the Ldn by 0.1 to 0.5 dBA. In environmental acoustics, they are used interchangeably.

[3] California Department of Transportation, Division of Environmental Analysis. *Traffic Noise Analysis Protocol for New Highway Construction, Reconstruction Projects, and Retrofit Barrier Projects*. April 2020. p. 3-1.

The 23CFR772 Noise Abatement Criteria are absolute, not relative, values.

The Federal Transit Administration (FTA) also recognizes that as the absolute level of noise exposure increases, the relative increase that results in a significant impact reduces. In its formulation of noise impact assessment, a 3 dBA Ldn increase in noise exposure at residences would only be allowed if the existing noise exposure is 55 dBA Ldn or less. Above that, the allowable increase is progressively smaller. Where the existing noise exposure is 64.0 dBA CNEL, as it is along Nielsen Avenue according to the DEIR, the allowable increase is 1.5 dBA. [DEIR Table 4.9.L at p. 4.9-19]



Reference: FTA Transit Noise and Vibration Impact Assessment Manual, FTA Report No. 0123, September 2018. p. 30.

B3-53 cont.

Table I presents information extracted from DEIR Table 4.9.L [p. 4.9-19]. Note that at every point in time that the noise is assessed, the noise exposure goes from a level that is lower than that established by General Plan Policy NS-1-a (65 dBA CNEL) to one that is higher. This constitutes a significant noise impact.

Table I Traffic Noise Levels Without and With Proposed Project

Roadway Segment	CNEL (dBA) 50 ft from Centerline of Nearest Lane					
	Existing		Opening Year		Year 2035	
	Without	With	Without	With	Without	With
Nielsen Ave between Marks and Hughes	64.0	**66.1**	64.4	**66.4**	64.4	**66.4**

B3-54

Comments on Construction Noise Analysis

The project construction noise analysis is presented on pages 4.915 to 4.9-18 of the DEIR. On page 4.9-16, reference noise levels for various types of construction equipment are presented. These reference levels are taken from the FHWA Roadway Construction Noise Model and are acceptable. On page 4.9-17, the DEIR presents equations to calculate the composite average (equivalent) noise level for construction equipment, a level that takes into account the reference noise emission level, the amount of time each piece of equipment it typically used, distance, and – potentially – the total amount of equipment anticipated to be used on site. I write "potentially" because the DEIR only calculated "the composite noise level of the two loudest pieces of equipment for each construction phase". [DEIR at p. 4.9-17. This is a common error that stems from FTA guidance that preliminarily, before much is known about construction, the order of magnitude of construction noise may be had by combining the levels of the two loudest pieces of equipment assuming they are running at full power 100% of the time. In this matter, the types and number of equipment is known in detail from the air quality assessment, so it is appropriate to conduct a detailed calculation of construction noise. As an aside, the calculation that the DEIR makes does not assume usage 100% of the time for the two loudest pieces of equipment, so does not even comport with the FTA preliminary guidance. **B3-55**

Table II shows a proper analysis of the noise levels for the first three phases of construction. The types and number of equipment are taken from the DEIR Appendix C, CalEEMod Output Sheets, 9/20/2002, p. 9. The reference emission levels (E.F.) and usage factors (U.F.) are from Table 4.9.K of the DEIR. Finally, the "average acoustical distance" used for the calculations is, as the DEIR explains, "calculated by multiplying the shortest distance between the receiver and the noise source area by the farthest distance, and then taking the square root of the product." For the homes on Nielsen Avenue, the shortest distance to the project site is 115 feet and the distance to the far corner is about 1,930 feet. The square root of 115 x 1,930 is 471 feet. **B3-56**

Following the DEIR analysis, the construction noise levels are logarithmically ("decibel") summed with the ambient (62.3 dBA Leq DEIR Table 4.9.D at p. 4.9-7) to arrive at the combined noise levels shown in Table III. Also shown in Table III is the increase in noise exposure which is larger than the 5 dBA increase the DEIR is using as the threshold of significance. [DEIR at p. 4.9-18] As such, construction noise should be flagged as a significant noise impact. **B3-57**

Finally on this point, I note that Mitigation Measure NOI-1 requires the use of mufflers and the designation of a "disturbance coordinator". While both of these are good ideas that should be implemented, neither would reduce the noise levels shown in Table II. The noise calculations use reference levels from equipment fit with mufflers (so, if the mufflers fall off or rusts away, the noise would be louder than shown, but it's not reasonable to assert that a second muffler could or would be added). Having a disturbance coordinator is always helpful for getting noise issues resolved, but does not, in and of itself, reduce noise levels. **B3-58**

Table II Construction Noise Calculations

Site Preparation

Combined	70.2	71.0	69.0
Increase	**7.9**	**8.7**	**6.7**

B3-59

Conclusion

1. The DEIR noise analysis substantiates that project traffic noise will cause noise exposure at residences on Nielsen Avenue to go from levels that are below the City's "desired maximum" – established as 65 dBA CNEL per General Plan Policy NS-1-a – to levels that are above the desired maximum. Because the project would the proximate cause for exceedance of this absolute threshold established by City policy, the project's operational noise impact is significant.

2. The DEIR construction noise analysis erred in that it used a preliminary analysis when the requisite information for a detailed analysis is available, and (to no end) it misapplied the preliminary analysis procedure. A proper detailed analysis conducted using information from the DEIR indicates that construction noise levels will exceed the adopted threshold of significance. As such, the construction noise impact is also significant.

Subject: 2740 West Nielsen Avenue Warehouse Project

Dear Mr. Carmichael,

I have reviewed trip generation, vehicle miles traveled (VMT) impacts and greenhouse gas (GHG) impacts of the City of Fresno Draft Environmental Impact Report for a proposed warehouse project at 2740 West Nielsen Avenue ("DEIR"). I make the following findings:

1) Given that the tenants have not been identified, trip generation is highly uncertain. The trip generation study the DEIR relies on includes warehouse sites with trip rates of two to six times the rate used in the DEIR.
2) Undercounting trips translates directly into undercounting VMT and GHG.
3) The DEIR applied the Fresno COG ABM to estimate that the project would generate 19.8 VMT per employee per day. The model covers only Fresno County and excludes the portion of travel outside the county. This issue is particularly important for truck trips because major intermodal facilities are 110 – 240 miles from the proposed project. The VMT analysis should be supplemented to include an analysis of external travel with a particular focus on truck travel.
4) The DEIR answers affirmatively that the project includes transportation demand strategies. The DEIR needs to document these trip reduction programs and explain how they will be enforced on the currently unknown tenants.

B3-62

Comment Letter B3 Attach.

Project Trip Generation Could Be Much Higher Than Assumed

The project is comprised of four office/warehouse buildings with a total gross floor area of 901,438 square feet. (DEIR, p. 1-3) The tenants have not been identified, and the nature of the operations are unknown at this time.

The DEIR estimates trip generation based on a 2019 study of warehouse trip generation done by WSP for the Western Riverside COG.[1] This study was based on counts at 16 warehouses, segmented between 11 fulfillment centers and 5 parcel hubs. Using average rates, the DEIR calculated trip generation is shown in Table 8, partially reproduced here. The DEIR estimates that the project will generate 1,920 trips per day including 342 truck trips per day.

Table 4.10.A: Project Trip Generation

Trip Generation[1]	Average Daily Trips	Weekday AM Peak Hour[2]			Weekday PM Peak Hour[2]		
		In	Out	Total	In	Out	Total

[1] Rates from the Western Riverside Council of Governments (WRCOG) *TUMF High-Cube Warehouse Trip Generation Study*, January 2019, prepared by WSP.

[2] The WRCOG study does not provide in/out splits for the peak hour trip generation. Therefore, in/out splits from Institute of Transportation Engineers (ITE) Trip Generation Manual (10th Edition) supplement Land Use 155 - "High-Cube Fulfilment Center Warehouse" have been used for obtaining in/out traffic.

[3] A Passenger Car Equivalent (PCE) factor 2.0 has been taken for 2-4 axle trucks based on Highway Capacity Manual (HCM) recommendations. Further, as a conservative approach, a PCE factor of 3.0 is taken, for 5+ axle trucks, consistent with latest practices in numerous California jurisdictions.

The data in the Western Riverside COG study are much more variable than the average rates suggest. As shown in the figure below, the different fulfillment center sites have wildly different trip generation rates, with an Amazon facility having an especially high rate.

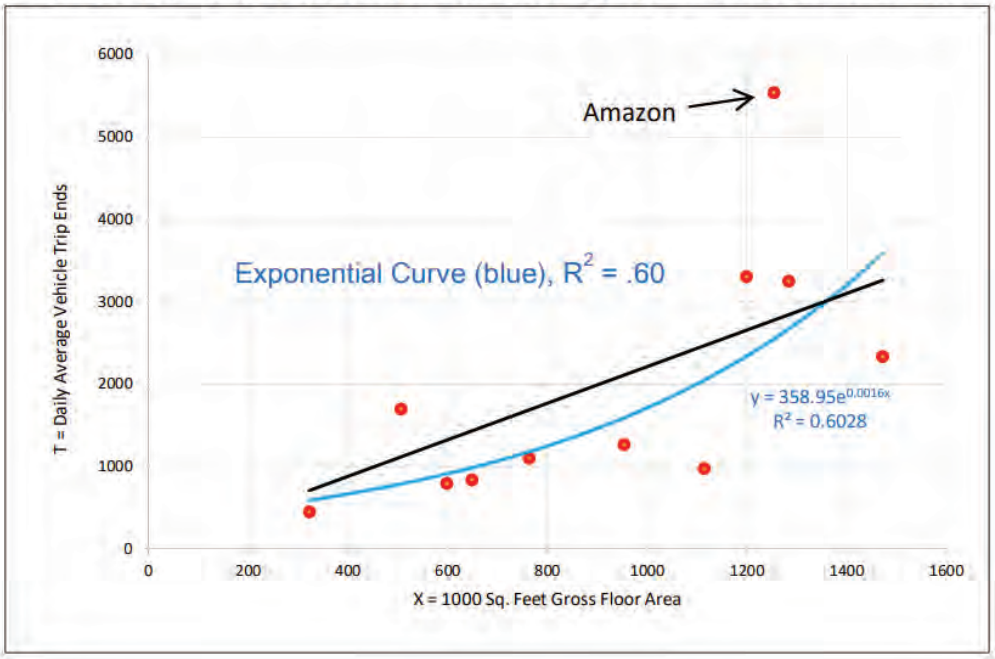
Attach.

Exhibit 1: Data Plot for Daily Total Vehicle Trip Ends against Building Size (Fulfillment Center)



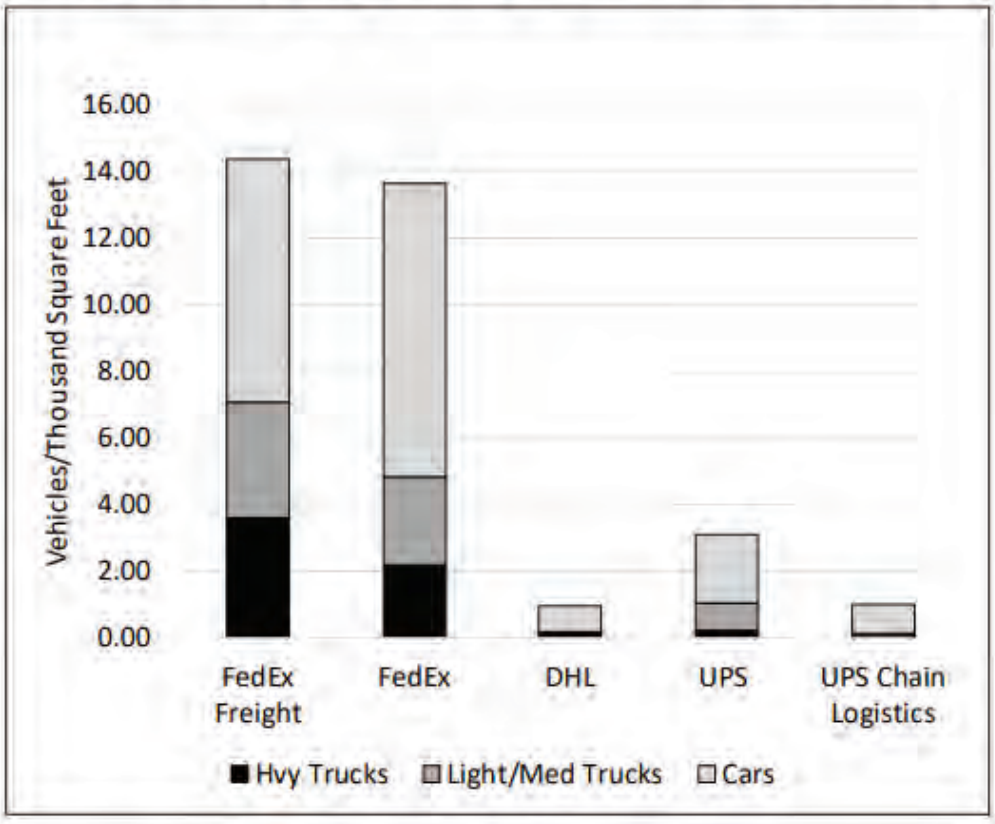
B3-63 cont.

Other businesses are copying many of Amazon's logistics methods, so the higher rate could be applicable to many new operations. For example, the trip generation rate at the Walmart site in the Western Riverside COG study also is higher than the average used in the DEIR. If the Amazon rate were applied to the proposed Fresno warehouse, project trip generation would be twice as high as estimated in the DEIR.

The observed trip generation rates at two of the parcel hub sites are even higher, i.e., more than six times the rate used in the DEIR.

Comment Letter B3 Attach.

Exhibit 11: Daily Trip Generation Rates at Parcel Hubs



B3-63 cont.

To be conservative, the DEIR should apply the Amazon trip generation rate, or possibly the even higher parcel hub rate if parcel hub tenants are possible in this project. The Amazon rate is about 4.5 daily trips per 1000 square feet. With the Amazon trip generation rate, the project would generate about 4,000 trips per day, i.e., twice the 1,920 trips per day estimated in the DEIR. The parcel hub trip generation rates are about 14 trips per day per 1000 square feet. At the parcel rate, the project would generate about 12,600 trips per day, i.e., over six times as many as estimated in the DEIR.

Comment Letter B3 Attach.

Project VMT and GHG Emissions Could Be Much Higher Than Assumed

The DEIR estimates project 5.6 million VMT per year using CalEEMod Version 4.0 (DEIR Vol. 1 Appendices A – I p. 146 of 1022). In CalEEMod, VMT is calculated from a combination of the assumed daily trip generation rate (discussed above) and assumptions about trip lengths.

If the Amazon trip generation rate were used instead, the VMT output from CalEEMod would be twice as high. If the parcel hub rate were used, the VMT output would six times as high.

The default CalEEMod trip lengths were applied in the DEIR:

- Work trips 9.5 miles
- Other trips 7.3 miles

If these default values are too low, this also would cause VMT to be underestimated. The DEIR estimates that 10.2% of daily trips are made by heavy trucks (5+ axles) and another 7.6% are made by medium trucks (2-4 axles). It is likely that the average truck trip lengths are much higher than assumed in the CalEEMod default values. Major intermodal facilities are far from the project site including: B3-64

- Rail intermodal facilities in Bakersfield 110 miles,
- Rail intermodal facilities in Stockton 120 miles,
- Port of Oakland 175 miles, and
- Port of Los Angeles 240 miles.

It is impossible to fully evaluate trip lengths until more is known about the facility operations.

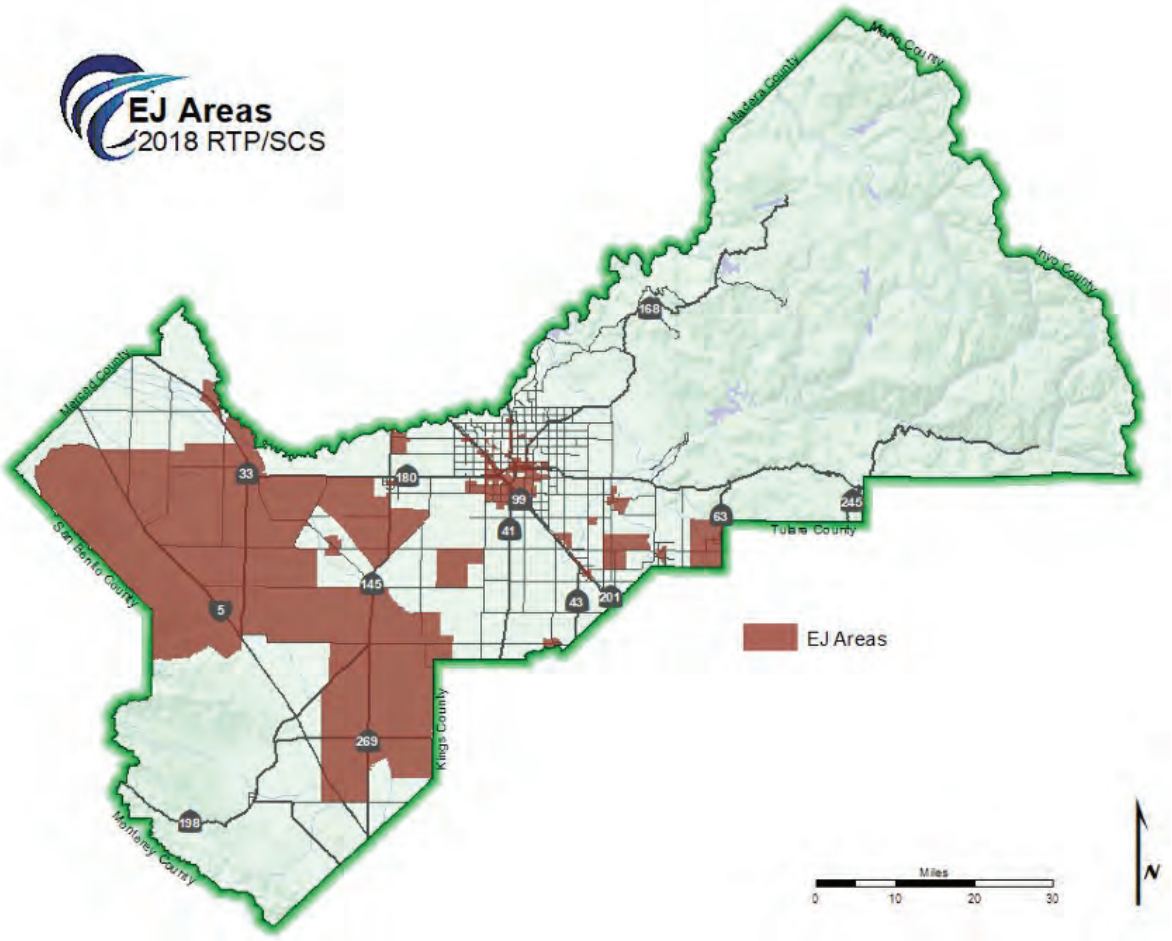
Any VMT underestimation translates to underestimating GHG as well.

Comment Letter
B3
Attach.

The DEIR Likely Underestimates VMT Impacts

The DEIR applied the Fresno COG ABM to estimate that the project would generate 19.8 VMT per employee per day. (DEIR, XHIBIT-6.-2740-W-Nielsen-Appendices-Vol-2_J-M-Copy.pdf, p. 396-398 of 786.

As shown in the Figure[2] below, the Fresno ABM covers only Fresno County.



A significant percentage of Fresno County trips have origins or destinations that are outside the County. As this issue is not discussed in the DEIR, it appears that all of the VMT outside the County ("external" travel) is excluded from the analysis.

This issue is particularly important for truck trips. As discussed in the previous section, major intermodal facilities are 110 – 240 miles from the proposed project. The VMT analysis should be supplemented to include an analysis of external travel with a particular focus on truck travel.

Comment Letter B3 Attach.

Transportation Demand Strategies Not Described in the DEIR

The DEIR includes a Greenhouse Gas (GHG) Reduction Plan Update – CEQA Project Consistency Checklist as Appendix H. This checklist answers in the affirmative:

- Does the project implement pedestrian bicycle, and transit linkages with surrounding land uses and neighborhoods? For GHG Reduction Plan consistency, the project must include all sidewalks, paths, trails, and facilities required by the General Plan and Active Transportation Plan, as implemented through the Fresno Municipal Code and project conditions of approval.
- Will the project accommodate a large employer (over 100 employees) and will it implement trip reduction programs such as increasing transit use, carpooling, vanpooling, bicycling, or other measures to reduce vehicle miles traveled pursuant to San Joaquin Valley Air Pollution Control District Rule 9410?

These transportation demand strategies are not described anywhere else in the DEIR, and they should be. In particular, the DEIR needs to explain how the second bullet regarding trip reduction programs will be enforced on the currently unknown tenants.

B3-66

Sincerely,

Norman L. Marshall

Resume

NORMAN L. MARSHALL, PRESIDENT

nmarshall@smartmobility.com

EDUCATION:

Master of Science in Engineering Sciences, Dartmouth College, Hanover, NH, 1982
Bachelor of Science in Mathematics, Worcester Polytechnic Institute, Worcester, MA, 1977

PROFESSIONAL EXPERIENCE: (33 Years, 19 at Smart Mobility, Inc.)

Norm Marshall helped found Smart Mobility, Inc. in 2001. Prior to this, he was at RSG for 14 years where he developed a national practice in travel demand modeling. He specializes in analyzing the relationships between the built environment and travel behavior and doing planning that coordinates multi-modal transportation with land use and community needs.

Regional Land Use/Transportation Scenario Planning

Portland Area Comprehensive Transportation System (PACTS) – the Portland Maine Metropolitan Planning Organization. Updating regional travel demand model with new data (including AirSage), adding a truck model, and multiclass assignment including differentiation between cash toll and transponder payments.

Loudoun County Virginia Dynamic Traffic Assignment – Enhanced subarea travel demand model to include Dynamic Traffic Assignment (Cube). Model being used to better understand impacts of roadway expansion on induced travel.

Vermont Agency of Transportation-Enhanced statewide travel demand model to evaluate travel impacts of closures and delays resulting from severe storm events. Model uses innovate Monte Carlo simulations process to account for combinations of failures.

B3-67

California Air Resources Board – Led team including the University of California in $250k project that reviewed the ability of the new generation of regional activity-based models and land use models to accurately account for greenhouse gas emissions from alternative scenarios including more compact walkable land use and roadway pricing. This work included hands-on testing of the most complex travel demand models in use in the U.S. today.

Climate Plan (California statewide) – Assisted large coalition of groups in reviewing and participating in the target setting process required by Senate Bill 375 and administered by the California Air Resources Board to reduce future greenhouse gas emissions through land use measures and other regional initiatives.

Chittenden County (2060 Land use and Transportation Vision Burlington Vermont region) – led extensive public visioning project as part of MPO's long-range transportation plan update.

Flagstaff Metropolitan Planning Organization – Implemented walk, transit and bike models within regional travel demand model. The bike model includes skimming bike networks including on-road and off-road bicycle facilities with a bike level of service established for each segment.

Chicago Metropolis Plan and Chicago Metropolis Freight Plan (6-county region)— developed alternative transportation scenarios, made enhancements in the regional travel demand model, and used the enhanced

model to evaluate alternative scenarios including development of alternative regional transit concepts. Developed multi-class assignment model and used it to analyze freight alternatives including congestion pricing and other peak shifting strategies.

Municipal Planning

City of Grand Rapids – Michigan Street Corridor – developed peak period subarea model including non-motorized trips based on urban form. Model is being used to develop traffic volumes for several alternatives that are being additional analyzed using the City's Synchro model

City of Omaha - Modified regional travel demand model to properly account for non-motorized trips, transit trips and shorter auto trips that would result from more compact mixed-use development. Scenarios with different roadway, transit, and land use alternatives were modeled.

City of Dublin (Columbus region) – Modified regional travel demand model to properly account for non-motorized trips and shorter auto trips that would result from more compact mixed-use development. The model was applied in analyses for a new downtown to be constructed in the Bridge Street corridor on both sides of an historic village center.

City of Portland, Maine – Implemented model improvements that better account for non-motorized trips and interactions between land use and transportation and applied the enhanced model to two subarea studies.

B3-67 cont.

City of Honolulu – Kaka'ako Transit Oriented Development (TOD) – applied regional travel demand model in estimating impacts of proposed TOD including estimating internal trip capture.

City of Burlington (Vermont) Transportation Plan – Led team that developing Transportation Plan focused on supporting increased population and employment without increases in traffic by focusing investments and policies on transit, walking, biking and Transportation Demand Management.

Transit Planning

Regional Transportation Authority (Chicago) and Chicago Metropolis 2020 – evaluated alternative 2020 and 2030 system-wide transit scenarios including deterioration and enhance/expand under alternative land use and energy pricing assumptions in support of initiatives for increased public funding.

Capital Metropolitan Transportation Authority (Austin, TX) Transit Vision – analyzed the regional effects of implementing the transit vision in concert with an aggressive transit-oriented development plan developed by Calthorpe Associates. Transit vision includes commuter rail and BRT.

Bus Rapid Transit for Northern Virginia HOT Lanes (Breakthrough Technologies, Inc and Environmental Defense.) – analyzed alternative Bus Rapid Transit (BRT) strategies for proposed privately-developing High Occupancy Toll lanes on I-95 and I-495 (Capital Beltway) including different service alternatives (point-to-point services, trunk lines intersecting connecting routes at in-line stations, and hybrid).

Roadway Corridor Planning

I-30 Little Rock Arkansas – Developed enhanced version of regional travel demand model that integrates TransCAD with open source Dynamic Traffic Assignment (DTA) software, and used to model I-30 alternatives. Freeway bottlenecks are modeled much more accurately than in the base TransCAD model.

Comment Letter B3 Attach.

South Evacuation Lifeline (SELL) – In work for the South Carolina Coastal Conservation League, used Dynamic Travel Assignment (DTA) to estimate evaluation times with different transportation alternatives in coastal South Caroline including a new proposed freeway.

Hudson River Crossing Study (Capital District Transportation Committee and NYSDOT) – Analyzing long term capacity needs for Hudson River bridges which a special focus on the I-90 Patroon Island Bridge where a microsimulation VISSIM model was developed and applied.

LETTER B3
Adams Broadwell Joseph & Cardozo
Kevin Carmichael
May 19, 2023

Response B3-1: This introductory comment is noted. This comment also provides a brief project description and does not contain any substantive comments or questions about the environmental analysis or conclusions contained in the Recirculated Draft EIR. Therefore, no further response is necessary.

Response B3-2: This introductory comment asserts that the DEIR fails to adequately analyze many of the project's significant environmental impacts and fails to propose enforceable mitigation measures that can reduce those impacts to a less than significant level. This comment is noted. Comments provided in this letter and in the technical appendices prepared by Clark and Associates, Wilson Ihrig, and Smart Mobility are further responded to below.

Response B3-3: This comment is a statement of the commenter's interest in enforcing environmental laws in the City of Fresno. The comment is noted, but it does not raise any significant environmental issues related to the project, or the analysis contained in the Recirculated Draft EIR.

Response B3-4: This comment is a statement of the commenter's understanding of various requirements under CEQA. The comment is noted, but it does not raise any significant environmental issues related to the project, or the analysis contained in the Recirculated Draft EIR.

Response B3-5: This comment claims that the Recirculated Draft EIR does not meet CEQA's requirements because it fails to include an accurate and complete Project Description, rendering the entire analysis inadequate.

Section 15124 of the CEQA Guidelines states that the description of the project shall contain the following information but should not supply extensive detail beyond that needed for evaluation and review of the environmental impact:

(a) The precise location and boundaries of the proposed project shall be shown on a detailed map, preferably topographic. The location of the project shall also appear on a regional map.

(b) A statement of the objectives sought by the proposed project. A clearly written statement of objectives will help the lead agency develop a reasonable range of alternatives to evaluate in the EIR and will aid the decision makers in preparing findings or a statement of overriding considerations, if necessary. The statement of objectives should include

the underlying purpose of the project and may discuss the project benefits.

(c) A general description of the project's technical, economic, and environmental characteristics, considering the principal engineering proposals, if any, and supporting public service facilities.

(d) A statement briefly describing the intended uses of the EIR, including: a list of the agencies that are expected to use the EIR in their decision making; a list of permits and other approvals required to implement the project; and a list of related environmental review and consultation requirements of federal, State, or local laws, regulations, or policies. To the fullest extent possible, the lead agency should integrate CEQA review with these related environmental review and consultation requirements and decisions subject to CEQA should be listed, preferably in the order in which they will occur.

Chapter 3.0, Project Description, of the Recirculated Draft EIR is consistent with these requirements and describes the characteristics of the proposed project. Figure 3-1 shows the project site's regional and local context and Figure 3-2 shows the project site and surrounding land uses, consistent with the requirements of Section 15124(a). In addition, the proposed project's objectives are listed in Section 3.2, Project Objectives, consistent with the requirements of Section 15124(b). A description of the proposed project is included in Section 3.3, Project Description, consistent with the requirements of Section 15124(c). In addition, the list of agencies and potential permits and approvals that may be required is included in Section 3.4, Approvals/Permits, consistent with the requirements of Section 15124(d). As such, the Project Description is consistent with CEQA requirements.

Response B3-6: This comment states that the Recirculated Draft EIR fails to identify the end uses of the project. Further, this comment suggests that the Recirculated Draft EIR uses an inappropriate trip generation rate. This comment claims that since the City lacks information about the type of end user that will ultimately occupy the project warehouses after construction, the Recirculated Draft EIR should have analyzed truck trips based on the most intensive reasonably foreseeable use of the site, such as an Amazon facility. Further, the comment also claims that since the Recirculated Draft EIR relies on average trip generation rates for its analysis of the project's operational air quality, health risk, GHG emissions, energy, noise, and VMT impact, the Recirculated Draft EIR may underestimate the severity of each of these impacts if a more trip-intensive use occurs at the project site.

The commenter claims that the Recirculated Draft EIR should have analyzed truck trips based on the most intensive reasonably foreseeable use of the site, such as an Amazon facility. As discussed in the Recirculated Draft EIR, the

proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. However, the project applicant has confirmed an Amazon facility is not under consideration to be a possible tenant. Since Amazon has not been identified as a tenant, using Amazon trip generation rates would not be accurate or applicable to the proposed project. The suggestion that Amazon trip generation rates would more accurately reflect the project's impacts is therefore speculative and unsupported by substantial evidence. (See CEQA Guidelines, § 15064, subd. (f)(5).) It should also be noted that Amazon has multiple existing facilities already located in Fresno. It is possible that Amazon could build another facility in Fresno; however, Amazon is not expected to locate another facility at the project site. (See id. at § 15145.)

As discussed in the TIS in Appendix M of the Recirculated Draft EIR, the trip generation for the proposed project was developed using rates from the Western Riverside Council of Governments (WRCOG) Study, included as an appendix to the TIS (Appendix M of the Recirculated Draft EIR). As discussed in the TIS, trip generation rates from the ITE manual for the High-Cube Fulfillment Center Warehouse land use have a small sample size. The WRCOG Study facilitated a trip generation study for such facilities. Further, trip generation rates using the WRCOG study are higher than trip generation rates from the ITE manual for the High-Cube Fulfillment Center Warehouse land use. As such, trip generation rates from the WRCOG Study are conservative and are appropriate for use. The WRCOG Study provides separate trip generation rates for passenger vehicles, 2- to 4-axle trucks, and 5+ axle trucks. The truck trips were converted to passenger car equivalent (PCE) trips using a PCE factor of 2.0 for 2- to 4-axle trucks, consistent with Highway Capacity Manual (HCM) recommendations. However, as a conservative approach, a PCE factor of 3.0 was used for 5+ axle trucks, consistent with the practices in several regions within the State. Additionally, as established in the WRCOG Study, the Amazon facility is an outlier. However, as further noted, that facility was also included to calculate the average trip generation rates for High-Cube Fulfilment Center Warehouse land uses. This methodology is also consistent with the recommended trip generation estimate methodology by ITE, which recommends using average trip generation rates for land uses. The WRCOG Study found that for larger projects, percentages of truck trips compared to total trips are lower than a fulfillment center of a smaller size. Therefore, the commenter is incorrect in stating that the trip generation assumptions substantially underestimated project trips.

As such, the project's operational air quality, health risk, GHG emissions, energy, noise, and VMT analyses used the correct traffic assumptions and the commenter has not provided evidence of a potentially significant environmental impact. This comment does not identify any new significant

environmental issues or impacts that were not already addressed in the Recirculated Draft EIR. Neither this comment nor the response constitutes new information requiring recirculation of the Recirculated Draft EIR.

Response B3-7: This comment states that the Recirculated Draft EIR did not disclose whether the project would require the use of backup generators. As discussed in the Recirculated Draft EIR, the proposed project would result in the construction of four office/warehouse buildings that would be configured for industrial uses by tenants that have not been identified. The use of such equipment would be dependent on specific tenants and is not being proposed as part of the project.

However, as described in Response A4-6, to be conservative, a supplemental analysis to evaluate potential emissions associated with equipment, emergency backup generators, and diesel fire pumps was conducted using CalEEMod. This supplemental analysis conservatively assumed that 40 diesel-powered forklifts would be used for 8 hours per day and that four diesel-powered 500 HP emergency backup generators and four diesel-powered 500 HP diesel fire pumps would be used for up to 50 hours per year. The results of the supplemental analysis, shown in Table A under Response A4-6, indicate that the use of equipment, emergency backup generators, and diesel fire pumps would not exceed the significance criteria for annual ROG, NO_X, CO, SO_X, PM_{10}, or $PM_{2.5}$ emissions. Because emissions would still be below the SJVAPCD's thresholds, operational emissions would still be considered less than significant. However, it is important to note that the use of equipment, emergency backup generators, and diesel fire pumps would be dependent on specific tenants and is not being proposed as part of the project.

Response B3-8: This comment states that the Recirculated Draft EIR did not disclose whether the project would require the use of diesel fire pumps. The comment also states that an email from the City Fire Department to the City Planning Department states that warehouse developments of this size will typically have high demand fire sprinkler systems for high rack storage and fire sprinkler systems will be supplemented with private fire pumps as needed.

The email from the City Fire Department states the following:

> A site plan entitlement has been submitted to the City of Fresno Planning and Development and circulated for comments from effected public agencies. With multiple public street frontages and the availability of 14 and 16 inch public water mains along those frontages, adequate fire access and water service connections for private fire hydrants and fire sprinkler systems are available. Based on the proposed buildings sizes, all buildings are required to install automatic fire sprinkler systems connected to an approved fire alarm monitoring service for rapid initiation

> of a fire department response. Warehouse developments of this size will typically have high demand fire sprinkler systems for high rack storage and fire sprinkler systems will be supplemented with private fire pumps as needed.

As such, this email states that fire sprinkler systems are only supplemented with private fire pumps needed. Diesel fire pumps are not being proposed as part of the project. Identifying such equipment would be speculative and unsupported by evidence. Further, as discussed in the Initial Study (provided in Appendix B of the Recirculated Draft EIR), the proposed project would be required to comply with all applicable codes for fire safety and emergency access. In addition, the project applicant would be required to submit plans to the FFD for review and approval prior to the issuance of building permits to ensure the project would conform to applicable building and fire codes.

However, as discussed in Responses A4-6 and B3-7, to be conservative, a supplemental analysis to evaluate potential emissions associated with equipment, emergency backup generators, and diesel fire pumps, was conducted using CalEEMod. This supplemental analysis conservatively assumed that 40 diesel-powered forklifts would be used for 8 hours per day and that four diesel-powered 500 HP emergency backup generators and four diesel-powered 500 HP diesel fire pumps would be used for up to 50 hours per year. The results of the supplemental analysis, shown in Table A under Response A4-6, indicate that the use of equipment, emergency backup generators, and diesel fire pumps would not exceed the significance criteria for annual ROG, NO_X, CO, SO_X, PM_{10}, or $PM_{2.5}$ emissions. Because emissions would still be below the SJVAPCD's thresholds, operational emissions would still be considered less than significant. However, it is important to note that the use of equipment, emergency backup generators, and diesel fire pumps would be dependent on specific tenants and is not being proposed as part of the project.

Response B3-9: This comment incorrectly claims that the Recirculated Draft EIR fails to accurately disclose the baseline environmental conditions related to the project's health risk impacts and that it lacks necessary baseline information against which to measure the project's environmental impacts with regard to impacts on sensitive receptors from construction.

The commenter is incorrect that the Recirculated Draft EIR fails to disclose the baseline environmental conditions related to the project's health risk impacts. Section 4.2.1, Environmental Setting of the Recirculated Draft EIR provides an overview of existing air quality conditions in the region and in the City of Fresno. Ambient air quality standards and the regulatory framework are summarized and climate, air quality conditions, and typical air pollutant types and sources are also described. Further, as identified on page 4.2-31 of the Recirculated Draft EIR, the closest sensitive receptors include the single-

family residences located approximately 110 feet south of the project site across West Nielsen Avenue.

As identified on pages 4.2-10 and 4.2-11 of the Recirculated Draft EIR, the OEHHA, on behalf of the CalEPA, released Version 4.0 of CalEnviroScreen in October 2021. CalEnviroScreen identifies California communities by census tract that are disproportionately burdened by, and vulnerable to, multiple sources of pollution. Pollution Burden scores for each census tract are derived from the average percentiles of the seven Exposures indicators (ozone and $PM_{2.5}$ concentrations, DPM emissions, drinking water contaminants, pesticide use, toxic releases from facilities, and traffic density) and the five Environmental Effects indicators (cleanup sites, impaired water bodies, groundwater threats, hazardous waste facilities and generators, and solid waste sites and facilities). According to the CalEnviroScreen 4.0 Map,[1] the project site has a pollution burden percentile of 97. Surrounding areas have pollution burdens ranging from 56 to 100.0. In addition, according to the SB 535 Disadvantaged Communities Map,[2] the project area is designated as an SB 535 disadvantaged community.

Although the project site has a pollution burden percentile of 97, there is no methodology to quantify the cumulative areawide or localized health risks within a community-wide area. The SJVAPCD's recommended thresholds of significance apply to individual development projects and evaluate the incremental increase in emissions from a proposed source. These thresholds do not apply to cumulative projects. The City relies on the SJVAPCD's recommended methodology to evaluate cumulative impacts, which is to conclude that an impact considered to be significant on a project-specific basis would also cause a significant cumulative impact. As shown in Table 4.2.K of the Recirculated Draft EIR, a project-specific HRA shows that the project would not result in a significant health risk to surrounding receptors at the project or cumulative level.

In addition, as described on page 4.2-26 of the Recirculated Draft EIR, the SJVAB is designated as non-attainment for ozone and $PM_{2.5}$ for federal standards and non-attainment for ozone, PM_{10}, and $PM_{2.5}$ for State standards. The SJVAPCD's non-attainment status is attributed to the region's development history. Past, present, and future development projects contribute to the region's adverse air quality impacts on a cumulative basis. By its very nature, air pollution is largely a cumulative impact. No single project is sufficient in size to, by itself, result in non-attainment of ambient

1 Office of Environmental Health Hazard Assessment (OEHHA). 2021. *CalEnviroScreen 4.0.* Website: https://oehha.ca.gov/calenviroscreen/report/calenviroscreen-40 (accessed May 2021).

2 OEHHA. 2022. *SB 535 Disadvantaged Communities using CalEnviroScreen 4.0 results.* Website: https://experience.arcgis.com/experience/1c21c53da8de48f1b946f3402fbae55c/page/SB-535-Disadvantaged-Communities/.pdf (accessed October 2022).

air quality standards. Instead, a project's individual emissions contribute to existing cumulatively significant adverse air quality impacts. If a project's contribution to the cumulative impact is considerable, then the project's impact on air quality would be considered significant. In developing thresholds of significance for air pollutants, the SJVAPCD considered the emission levels for which a project's individual emissions would be cumulatively considerable. If a project exceeds the identified SCAQMD significance thresholds, its emissions would be cumulatively considerable, resulting in significant adverse air quality impacts to the region's existing air quality conditions. Therefore, since a project's individual emissions are not cumulatively considerable, additional analysis to assess cumulative impacts is not necessary.

As shown in Tables 4.2-G and 4.2-H of the Recirculated Draft EIR, the proposed project would generate construction and operational emissions that are below the SJVAPCD's thresholds. As such, the proposed project would not result in a cumulative air quality impact.

Response B3-10: This comment states that the Recirculated Draft EIR fails to adequately establish the existing baseline with respect to Valley Fever. In addition, this comment asserts that the Recirculated Draft EIR must include a proper discussion of the potential for the presence of coccidioidomycosis fungus spores at the project site in order to accurately analyze and mitigate the project's potentially significant health risk impacts from Valley Fever.

Background information regarding Valley Fever is discussed on pages 4.2-5 and 4.2-6 of the Recirculated Draft EIR. However, the air quality analysis contained in Section 4.2, Air Quality, of the Recirculated Draft EIR was prepared using the methodologies and assumptions contained in the SJVAPCD's GAMAQI. The GAMAQI does not include requirements or thresholds of significance for addressing Valley Fever. The closest sensitive receptors include the single-family residences located approximately 110 feet south of the project site across West Nielsen Avenue. Except under high wind conditions, this distance is sufficient that particulate matter will settle prior to reaching the nearest sensitive receptor. In addition, crosswinds influenced by adjacent traffic intersections would help dissipate any particulate matter associated with the construction phase of the project. Therefore, any Valley Fever spores suspended with the dust will not reach the sensitive receptors. However, during project construction, it is possible that workers could be exposed to Valley Fever through fugitive dust. Dust control measures, consistent with SJVAPCD Regulation VIII (as required by Mitigation Measure AIR-1), would reduce the exposure of the workers. Dust from the construction of the project is not anticipated to exacerbate or significantly add to the existing exposure of people to Valley Fever.

Response B3-11: This comment is a statement of the commenter's understanding of CEQA's "substantial evidence" standard and discusses the standard of review that applies when a court is determining whether a lead agency failed to proceed in a manner required by law. The comment is noted, but it does not raise any significant environmental issues related to the project or the analysis contained in the Recirculated Draft EIR.

Response B3-12: This comment claims that the transportation impacts analysis is flawed with respect to the analysis of the project's trip generation and VMT impacts.

As discussed in Response B3-6, the proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. However, the project applicant has confirmed that an Amazon facility is not under consideration to be a possible tenant. Since Amazon has not been identified as a tenant, using Amazon trip generation rates would not be accurate or applicable to the proposed project. The suggestion that Amazon trip generation rates would more accurately reflect the project's impacts is therefore speculative and unsupported by substantial evidence. (See CEQA Guidelines, § 15064, subd. (f)(5).) It should also be noted that Amazon has multiple facilities already located in Fresno. It is possible that Amazon could build another facility in Fresno; however, Amazon is not expected to locate another facility at the project site. (See id. at § 15145.)

In addition, as demonstrated in Response B3-14, the Fresno COG ABM was used for the proposed project's VMT analysis. As discussed on page 4.10-14 of the Draft EIR, the project is non-residential in nature but would not be classified as an office or retail project. Additionally, the project does not require a General Plan Amendment. Therefore, the project's VMT per employee was compared to the existing regional average VMT per employee. The existing regional average is 25.6 VMT per employee, as established in the City of Fresno CEQA Guidelines for Vehicle Miles Traveled Thresholds. Based on the Fresno COG ABM output, the project's VMT was calculated to be 19.8 VMT per employee. As such, the project's VMT per employee rate is 22.66 percent lower than the existing regional average VMT per employee or the City's threshold. In conclusion, the project would result in a less than significant VMT impact concerning consistency with CEQA Guidelines Section 15064.3(b). Therefore, the commenter is incorrect in stating that the trip generation and VMT assumptions were flawed.

Response B3-13: This comment claims that the Recirculated Draft EIR incorrectly calculates the project's operational trip generation because the City does not have information on the future tenants of the project site or what the eventual use of the project buildings will be. The comment states the City's reliance on the selected trip rates is therefore unreasonable and unsupported.

Please refer to Response B3-6. The commenter claims that the Recirculated Draft EIR should have analyzed truck trips based on the most intensive reasonably foreseeable use of the site, such as an Amazon facility. As discussed in the Recirculated Draft EIR, the proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. However, the project applicant has confirmed that Amazon is not under consideration as a possible tenant. Since Amazon has not been identified as a tenant, using Amazon trip generation rates would not be accurate or applicable to the proposed project. As discussed in Response B3-6, Amazon has multiple existing facilities already located in Fresno and is not expected to locate another facility at the project site. The project applicant has confirmed that no tenants have been identified, and the suggestion that Amazon trip generation rates would more accurately reflect the project's impacts is therefore speculative and unsupported by substantial evidence. (See CEQA Guidelines, § 15064, subd. (f)(5).) Additionally, as established in the WRCOG Study, the Amazon facility is an outlier. Also, the WRCOG Study recommends using the average rates on page 4 of the WRCOG Study. However, as further noted, that facility was also included to calculate the average trip generation rates for High-Cube Fulfilment Center Warehouse land uses. This methodology is also consistent with the recommended trip generation estimate methodology by ITE, which recommends using average trip generation rates for land uses.[1] It should also be noted that the WRCOG Study found that for larger projects, percentages of truck trips compared to total trips are lower than a fulfillment center of a smaller size. Therefore, the commenter is incorrect in stating that the trip generation assumptions were not adequate. The commenter has not shown substantial evidence of a potentially significant environmental impact.

Response B3-14: This comment asserts that the Recirculated Draft EIR underestimates project VMT. This comment states that the Recirculated Draft EIR estimates that 10.2 percent of daily trips are made by heavy trucks (5+ axles) and another 7.6 percent are made by medium trucks (2 to 4 axles), and that the average trip lengths are calculated to be 9.5 miles for work trips and 7.3 miles for other trips. This comment claims that these estimates are likely much lower than the actual average truck trip lengths that could be generated by the project.

As discussed on pages 4.10-12 through 4.10-14 of the Recirculated Draft EIR, the Fresno COG ABM was used to estimate the project VMT and VMT metric. ABM is a tour-based model that captures the travel behavior of the region comprehensively. As such the project employee VMT included VMT from all employee tours and sub-tours. This comprises employee commute tours, project-related delivery tours within the region, and any other tours related

[1] Institute of Transportation Engineers. 2017. *Trip Generation Handbook, 3rd Edition* (page 26). September.

to the project. Also, project VMT and the VMT metric used for this analysis are consistent with both the City's and the Fresno COG's adopted methodology/guidelines for preparation of VMT analysis. The guidelines provide substantial evidence demonstrating the appropriateness of the VMT analysis methodology consistent with the intended goals for SB 743.

The commenter is incorrect in stating that the VMT analysis did not include or fully evaluate trips that originate/are destined outside Fresno County. As shown in Appendix G of the traffic study, the project VMT included employee trips that originated/were destined outside of Fresno County (internal-external/external-internal trips). Therefore, the project VMT estimates accounted for trips originating from outside the Fresno COG ABM region as well.

In addition, truck trips were not included in the VMT analysis, consistent with the CEQA Guidelines Section 15064.3, subdivision (a), which states "For the purposes of this section, 'vehicle miles traveled' refers to the amount and distance of automobile travel attributable to a project." The technical guidance from OPR does say that heavy-duty truck VMT "*could be included*"; however, the Guidance goes on to state that this would be for modeling convenience and ease of calculation. Heavy-duty trucks are not included in the CEQA guidelines for VMT analysis, are not included in the Fresno COG model, and therefore were not included in the VMT analysis. "An agency's use of a reasonable standard for gauging the significance of an impact may not be set aside on the ground the impact would have been found significant if other recognized standards had instead been used." (Kostka, § 6.45, p. 6-50/50; see *Jensen*, *supra*, 23 Cal.App.5th at 887; *Citizens for Responsible Equitable Environmental Development*, *supra*, 197 Cal.App.4th at 336–336.)

This comment does not identify any new significant environmental issues or impacts that were not already addressed in the Recirculated Draft EIR. Neither this comment nor the response constitutes new information requiring recirculation of the Recirculated Draft EIR.

Response B3-15: This comment claims that the Recirculated Draft EIR fails to include any mitigation measures to reduce the project's VMT impacts and fails to include analysis of the feasibility of the above methods, or any other methods, to reduce the project's potentially significant impacts.

Refer to Responses B2-13 and B3-14. As discussed on pages 4.10-13 and 4.10-14 of the Recirculated Draft EIR, a detailed VMT analysis discussion is included in Chapter 13 of the TIS (see Appendix M), consistent with the requirements of SB 743. As recommended in the City of Fresno CEQA Guidelines for Vehicle Miles Traveled Thresholds, for projects that could not be screened out from a quantitative VMT assessment, the VMT analysis should be conducted using the Fresno COG ABM, which is a tour-based model. Therefore, the Fresno

COG ABM was used for the project VMT analysis. The model database was updated with the project land uses to calculate project VMT.

The project is non-residential in nature but would not be classified as an office or retail project because of the warehouse and heavy industrial uses contemplated for the buildings. Additionally, the project does not require a General Plan Amendment. Therefore, the project's VMT per employee was compared to the existing regional average VMT per employee. The existing regional average is 25.6 VMT per employee, as established in the City of Fresno CEQA Guidelines for Vehicle Miles Traveled Thresholds. Based on the Fresno COG ABM output, the project's VMT was calculated to be 19.8 VMT per employee. As such, the project's VMT per employee rate is 22.66 percent lower than the existing regional average VMT per employee, or the City's threshold. In conclusion, the project would result in a less than significant VMT impact concerning consistency with CEQA Guidelines Section 15064.3(b). The commenter did not demonstrate that the project would result in a potentially significant environmental impact based on substantial evidence. Therefore, the Recirculated Draft EIR properly determined that the proposed project would result in a less than significant impact related to VMT. As such, identification and analysis of mitigation measures is not required.

Response B3-16: The comment asserts that the Recirculated Draft EIR states that the project may be subject to SJVAPCD Rule 9410 – Employer Based Trip Reduction, but that it does not include this rule as mitigation for the project. In addition, this comment claims that the Recirculated Draft EIR fails to include any mitigation measures to reduce the project's VMT impacts, including individual measures included in SJVAPCD Rule 9410.

As discussed in Response A4-18, the proposed project would comply with all required SJVAPCD rules and regulations. In addition, as identified in Appendix H, Greenhouse Gas Reduction Plan Update Checklist, of the Recirculated Draft EIR, the project would have over 100 employees and would be required to comply with SJVAPCD Rule 9410. Further, as discussed in Response B3-15, the project would result in a less than significant VMT impact concerning consistency with CEQA Guidelines Section 15064.3(b). As such, identification and analysis of mitigation measures is not required.

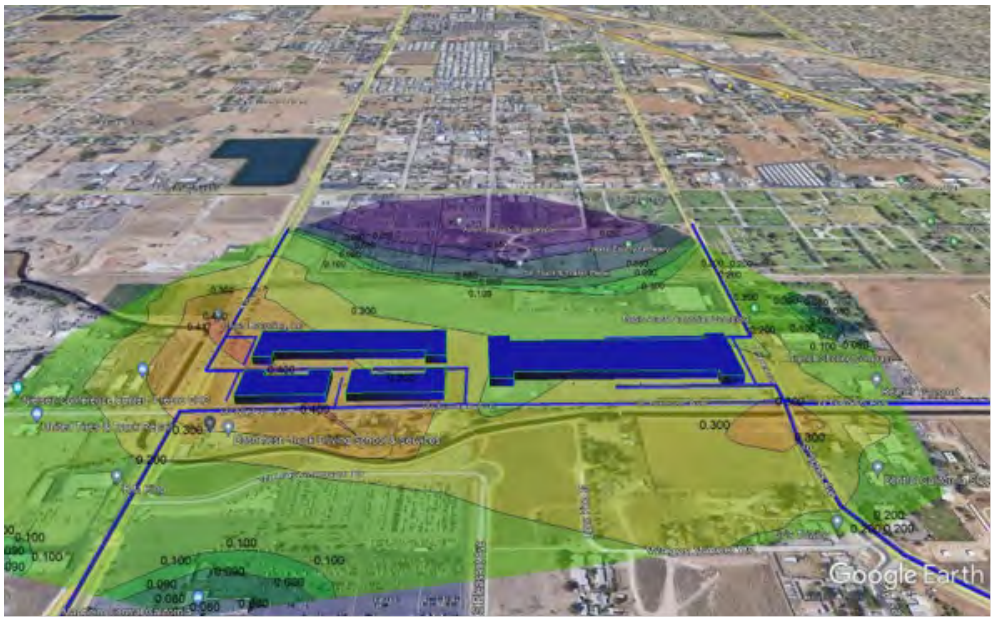
Response B3-17: This comment claims that the Recirculated Draft EIR failed to accurately analyze the project's operational health risk and that the air dispersion model used in the analysis has a structural flaw that results in inaccurate estimates of the project emissions within the community. In addition, this comment claims that building downwash effect was not included, resulting in an underestimation of exposure concentrations.

As discussed on page 4.2-34 of the Recirculated Draft EIR, an HRA was prepared in accordance with policies and procedures of the State OEHHA and the SJVAPCD. It evaluates the project against the significance criteria established by the SJVAPCD and was prepared in compliance with all applicable requirements, including, but not limited to, the City of Fresno General Plan Program EIR Mitigation Measure AIR-3.1. In order to assess the dispersion of emissions associated with the project, air dispersion modeling was performed using AERMOD. The model is approved by the USEPA when estimating the air quality impacts associated with point and fugitive sources in simple and complex terrain. The model was used to calculate the annual average pollutant concentrations associated with each emitting source.

CARB's HARP2 model was used to translate the TAC concentrations from AERMOD into long-term carcinogenic and chronic, and short-term acute health risk levels following the guidance in the SJVAPCD risk assessment guidelines. To estimate chronic noncancer risks at residential receptors, the "OEHHA-Derived Method" risk-calculation option was used. Following the OEHHA guidance, an 8-hour chronic noncancer risk was calculated for residential receptors because the project would operate more than 8 hours per day and 5 days per week.

Discrete variants for daily breathing rates, exposure frequency, and exposure duration were obtained from relevant distribution profiles presented in the OEHHA guidance document entitled *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments* and guidance from SJVAPCD. As such, the modeling conducted for the HRA is adequate.

The SJVAPCD Guidance suggests that building downwash effects be included. The commenter incorrectly states that the EIR fails to account for building downwash. In fact, the modeling conducted for the project included building downwash, as recommended by the SJVAPCD. The following image shows a snapshot of the model and 3-D representation of the building heights that were used to model the downwash effect. The model was made available to the public for review and download at the City. As such, the HRA represents an accurate representation of the project and the disclosed emissions are accurate.



Response B3-18: This comment states that the Recirculated Draft EIR fails to analyze and mitigate Valley Fever impacts from project construction. Refer to Response B3-10. Background information regarding Valley Fever is discussed on pages 4.2-5 and 4.2-6 of the Recirculated Draft EIR. The air quality analysis contained in Section 4.2, Air Quality, of the Recirculated Draft EIR was prepared using the methodologies and assumptions contained in the SJVAPCD's GAMAQI. Neither the GAMAQI nor the *State CEQA Guidelines* include requirements or thresholds of significance for addressing Valley Fever. The closest sensitive receptors include the single-family residences located approximately 110 feet south of the project site across West Nielsen Avenue. Except under high wind conditions, this distance is sufficient that particulate matter will settle prior to reaching the nearest sensitive receptor. In addition, crosswinds influenced by adjacent traffic intersections would help dissipate any particulate matter associated with the construction phase of the project. Therefore, any Valley Fever spores suspended with the dust will not reach the sensitive receptors. Dust control measures, consistent with SJVAPCD Regulation VIII (as required by Mitigation Measure AIR-1), would reduce the exposure of the workers. Dust from the construction of the project is not anticipated to exacerbate or significantly add to the existing exposure of people to Valley Fever.

Response B3-19: This comment states that the Recirculated Draft EIR fails to incorporate mitigation measures that would address Valley Fever risks to construction employees and sensitive receptors. Refer to Response B3-18. As noted above, there are no CEQA standards for coccidioidomycosis exposure. Any exposure to workers would be subject to the Occupational Safety and Health (OSH) Act of 1970, 29 United States Code (USC) 654(a)(1), and other appliable

Occupational Safety and Health Administration requirements, including Respiratory Protection (29 CFR 1910.134), which covers respirator use in the workplace. However, the proposed project would not exacerbate or significantly add to the existing exposure of people to Valley Fever and therefore mitigation to reduce CEQA impacts is not required.

Response B3-20: This comment states that the Recirculated Draft EIR did not analyze air quality impacts associated with the use of backup generator and fire pumps. This comment also claims that the project's trip generation rates and VMT are unsupported, resulting in significant air quality and GHG impacts.

The proposed project did not identify the use of backup generators or fire pumps. As discussed in the Recirculated Draft EIR, the proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. The use of such equipment would be dependent on specific tenants and is not being proposed as part of the project.

However, as discussed in Responses A4-6 and B3-7, to be conservative, a supplemental analysis to evaluate potential emissions associated with equipment, emergency backup generators, and diesel fire pumps was conducted using CalEEMod. This supplemental analysis conservatively assumed that 40 diesel-powered forklifts would be used for 8 hours per day and that four diesel-powered 500 HP emergency backup generators and four diesel-powered 500 HP diesel fire pumps would be used for up to 50 hours per year. The results of the supplemental analysis, shown in Table A under Response A4-6, indicate that the use of equipment, emergency backup generators, and diesel fire pumps would not exceed the significance criteria for annual ROG, NO_X, CO, SO_X, PM_{10}, or $PM_{2.5}$ emissions. Because emissions would still be below the SJVAPCD's thresholds, operational emissions would still be considered less than significant. However, it is important to note that diesel fire pumps are not being proposed as part of the project.

For a discussion of the project's trip generation rates and VMT, please refer to Responses B3-6, B3-12, B3-13, B3-14, and B3-15. As explained in these responses, the Recirculated Draft EIR properly evaluated the project's trip generation rates and VMT. As such, the project's air quality and GHG analyses used the correct trip generation and VMT assumptions and the commenter has not shown substantial evidence of a potentially significant environmental impact.

Response B3-21: This comment states that the Recirculated Draft EIR fails to account for the operation of backup generators. As discussed in the Recirculated Draft EIR, the proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. However, as discussed in

Responses A4-6 and B3-7, to be conservative, a supplemental analysis to evaluate potential emissions associated with equipment, emergency backup generators, and diesel fire pumps was conducted using CalEEMod. This supplemental analysis conservatively assumed that 40 diesel-powered forklifts would be used for 8 hours per day and that four diesel-powered 500 HP emergency backup generators and four diesel-powered 500 HP diesel fire pumps would be used for up to 50 hours per year. The results of the supplemental analysis indicate that the use of equipment, emergency backup generators, and diesel fire pumps would not exceed the significance criteria for annual ROG, NOX_x, CO, SO_X, PM_{10}, or $PM_{2.5}$ emissions. Because emissions would still be below the SJVAPCD's thresholds, operational emissions would still be considered less than significant. However, it is important to note that generators are not proposed as part of the project.

Response B3-22: This comment asserts that the transportation impact analysis fails to accurately analyze the project's operational truck trip generation rates and likely underestimates the project's VMT. This comment also asserts that the project's air quality analysis relies on the transportation impact analysis' trip generation numbers and VMT in order to calculate the project's air emissions and analyze the project's air quality and GHG emissions impacts. This comment claims that the project's transportation impact analysis must be corrected to accurately analyze the project's air quality impacts.

As described in Responses B3-6, B3-12, B3-13, B3-14, and B3-15, the traffic assumptions are supported by substantial evidence further explained in the TIS that was prepared for the project, included in Appendix M of the Recirculated Draft EIR. The Technical Memorandum prepared by WSP and dated January 29, 2019, which was included as an appendix to the TIS, explains in great detail the basis for the trip generation rates used in the traffic analysis and air quality analysis. Further, the air quality analysis did not incorporate the VMT from the TIS as the VMT analysis for SB 743 uses a different methodology than air quality. The air quality analysis utilized default trip lengths provided in CalEEMod. Refer to Response A4-3 for a detailed discussion of CalEEMod default assumptions. As demonstrated in Response A4-3, since a project-specific truck trip length is not yet known, the use of CalEEMod defaults is appropriate for projects in the SJVAPCD and the city of Fresno and is consistent with standard practice. As such, the project's air quality analyses used the correct trip generation and VMT assumptions.

Response B3-23: This comment claims that the Recirculated Draft EIR relies on a faulty methodology to analyze the project's construction noise and improperly relies on a relative threshold of significance with regard to the project's operational noise from traffic. It also claims that the Recirculated Draft EIR fails to properly analyze and mitigate the project's significant construction and operational noise impacts. This comment also states that CEQA requires

agencies to conduct noise analyses for projects that consider both the absolute noise levels expected and the degree noise levels are expected to increase. It claims that noise studies that rely on a single measure that excludes possible significant impacts from noise increases or noise extremes do not receive deference by reviewing courts.

This comment provides an introduction to following comments, which are responded to further in Response B3-24 and Response B3-25.

Response B3-24: This comment states that the Recirculated Draft EIR only relies on a relative threshold to determine that the project will not result in a significant impact. Further, this comment states that the City's General Plan Policy NS-1-a establishes "65 dBA L_{dn} or CNEL as the standard for the desirable maximum average exterior noise levels for defined usable exterior areas of residential and noise-sensitive uses" such as those along Nielsen Avenue, south of the project site. This comment also claims that based on the data provided in the Recirculated Draft EIR, the roadway segment on Nielsen Avenue between Marks Avenue and Hughes Avenue will see an increase from the existing 64.0 A-weighted decibels (dBA) Community Noise Equivalent Level (CNEL) to 66.1 dBA CNEL with the addition of project-generated traffic. Based on the Recirculated Draft EIR's own data, the project will cause noise levels at nearby sensitive receptors to exceed the desirable maximum average exterior noise levels for defined usable exterior areas of residential and noise-sensitive uses of 65 dBA CNEL, resulting in a significant impact.

As identified on page 4.9-13 of the Recirculated Draft EIR, as established in General Plan Policy NS-1-j: Significance Threshold, the City considers a 3 dBA increase to be a significant increase in ambient noise. As described on pages 4.9-18 through 4.9-21 of the Recirculated Draft EIR, project-related traffic noise would be no greater than 2.1 dBA. Noise level increases less than 3.0 dBA are not considered perceptible to most people in an outdoor environment. In addition, as shown in Table 4.9.D of the Recirculated Draft EIR, existing daily noise levels along West Nielsen Avenue near the existing sensitive receptors range from 67.6 dBA CNEL to 68.1 dBA CNEL. Because noise levels would increase less than 3.0 dBA, this is consistent with General Plan Policy NS-1-j: Significance Threshold, which states that an increase of 3 dBA CNEL or more is considered significant. There is currently no General Policy stating that a less than 3 dBA increase resulting in levels going from below 65 dBA CNEL to above 65 dBA CNEL would constitute a significant impact. Further, the 65 dBA CNEL standard applies to new development as a land use compatibility standard and is not an applicable threshold of significance for noise level increases. Therefore, the commenter is incorrect that 65 dBA CNEL is an applicable threshold. As such, traffic noise impacts from project-related traffic on off-site sensitive receptors would be less than significant.

Response B3-25: The commenter claims that they calculated the noise levels generated during each phase of construction combined with the existing ambient noise levels to determine the noise impacts on the closest residential receptors located south of the project site and found that the site preparation phase will result in a noise level of 70.2 dBA L_{eq}, while grading will result in a noise level of 71 dBA L_{eq} and building construction will result in a noise level of 69.0 dBA L_{eq}. Further, this comment claims that Mitigation Measure NOI-1 would not reduce the project's significant construction noise impacts.

As identified in Table 4.9.K of the Recirculated Draft EIR, construction noise levels were based on the Federal Highway Administration Roadway Construction Noise Model. In addition to the reference maximum noise level, the usage factor provided in Table 4.9.K is used to calculate the hourly noise level impact for each piece of equipment. Each piece of construction equipment operates as an individual point source. Therefore, a composite noise level can be calculated when multiple sources of noise operate simultaneously.

Using the equations from the methodology identified on page 4.9-17 of the Recirculated Draft EIR, the reference information in Table 4.9.K, and the construction equipment list provided, the composite noise level of the two loudest pieces of equipment for each construction phase was calculated. The project construction composite noise levels at a distance of 50 feet for would range from 74 dBA equivalent continuous noise level (L_{eq}) to 84 dBA L_{eq}, with the highest noise levels occurring during the grading phase.

Once composite noise levels are calculated, reference noise levels can then be adjusted for distance. In general, doubling the distance would decrease noise levels by 6 dBA, while halving the distance would increase noise levels by 6 dBA.

The Recirculated Draft EIR evaluated construction noise levels based on the composite noise level of the two loudest pieces of equipment for each construction phase, consistent with the Federal Transit Administration (FTA) Noise and Vibration Impact Assessment Manual (FTA Manual). The FTA Manual states that while it is not the purpose of the manual to specify standardized criteria for construction noise impacts, the guidelines can be considered reasonable criteria for assessment. The FTA Manual provides two options for noise assessment: Option A, General Assessment, to evaluate the two noisiest pieces of equipment for each phase of construction; and Option B, Detailed Analysis, to evaluate all equipment for each phase of construction. The air quality analysis utilized a default construction fleet from CalEEMod, which was used in the noise analysis. However, since the proposed project's specific construction equipment list is unknown at this time, for purposes of the noise assessment, it is likely that two pieces of equipment would be used at a specific distance from the receptor at any one time.

As discussed on pages 4.9-17 and 4.9-18 of the Recirculated Draft EIR, while construction noise will vary, it is expected that composite noise levels during construction at the nearest off-site sensitive residential use to the south would reach an average noise level of 64 dBA L_{eq} during daytime hours. While construction-related, short-term noise levels have the potential to be higher than quieter daytime ambient noise levels in the project area under existing conditions, the construction noise impacts would be approximately 1.7 dBA greater than the existing average daytime noise level of 64.7 dBA L_{eq} during the allowable hour of construction. When logarithmically combined with the existing average ambient noise level, the total noise level would be 66.2 dBA L_{eq}, resulting in an increase of 3.9 dBA L_{eq}. As identified in Table 4.9.I of the Recirculated Draft EIR, for stationary sources, mitigation shall only be required to limit noise to the ambient plus 5 dBA. Because the increase would be less than 5 dBA, construction noise would be considered less than significant.

However, when utilizing the detailed construction methodology and information from the CalEEMod results, assuming each piece of equipment operating simultaneously over the site for each phase, as suggested by the commenter, the composite noise levels during construction at the nearest off-site sensitive residential use to the south would reach an average noise level of 68.9 dBA L_{eq} at the acoustical average distance of 471 feet during daytime hours. Additionally, based on CalEEMod results, it is assumed that equipment would operate for no more than 8 hours per day. In order to provide a more accurate assessment consistent with CalEEMod results and the FTA methodology, the average ambient noise level at the nearest residential uses between the hours of 7:00 a.m. and 4:00 p.m., a period including an 8-hour work day and a 1 hour lunch, is 66.0 dBA L_{eq}. This noise level would be approximately 2.9 dBA greater than the existing average daytime noise level of 66.0 dBA L_{eq} during the allowable hours of construction. When logarithmically combined with the existing average ambient noise level, the total noise level would be 70.7 dBA L_{eq}, resulting in an increase of 4.7 dBA L_{eq}. Because the increase would still be less than 5 dBA, construction noise would still be considered less than significant.

The discrepancy between the 68.9 dBA L_{eq} calculated in the noise analysis and the commenter's calculation of 71 dBA L_{eq} is a result of the noise analysis using the actual measured noise levels as compared to spec data within the Roadway Construction Noise Model (RCNM). It is our professional opinion that the use of actual measured data is more accurate than spec data.

In addition, as discussed in the Recirculated Draft EIR, although the project's potential construction-related noise level increase would be less than 5 dBA, project construction noise has the potential to result in annoyance to surrounding receptors. Therefore, the applicant would be required to

implement Mitigation Measure NOI-1, which would ensure that all equipment, fixed or mobile, would be required to be equipped with properly operating and maintained mufflers, consistent with manufacturers' standards. Additionally, Mitigation Measure NOI-1 requires the project to designate a "disturbance coordinator" at the City who would be responsible for responding to any local complaints about construction noise. The disturbance coordinator would determine the cause of the noise complaint (e.g., starting too early, bad muffler) and would determine and implement reasonable measures warranted to correct the problem. This measure would reduce annoyance associated with construction noise as a significant construction noise impact was not identified. Additional construction noise mitigation measures are not required.

Response B3-26: This comment states that CEQA requires that EIRs include a discussion of the potential energy impacts of proposed projects and a detailed statement of mitigation measures designed to minimize significant effects on the environment (including, but not limited to, measures to reduce the wasteful, inefficient, and unnecessary consumption of energy). This comment also claims that the Recirculated Draft EIR falls short of the mandates of Appendix F.

As discussed in Section 4.5.3.1 of the Recirculated Draft EIR, thresholds for impacts related to energy used in the analysis are consistent with Appendix G of the *State CEQA Guidelines,* which state that development of the proposed project would result in a significant impact related to energy if it would: result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation; or conflict with or obstruct a State or local plan for renewable energy or energy efficiency.

Further, Appendix F of the *State CEQA Guidelines* states that EIRs must include a discussion of the potential energy impacts of proposed projects, with particular emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy. As demonstrated in Section 4.6, Energy, the proposed project would not result in inefficient, wasteful, and unnecessary consumption of energy, and the project would not result in a significant energy impact.

Response B3-27: This comment asserts that the Recirculated Draft EIR fails to adequately analyze the significance of the project's energy impacts related to the project's use of fossil fuels consumed by project-related vehicle trips. Further, this comment states that the Recirculated Draft EIR states that the project would increase gasoline consumption in the city of Fresno by 0.11 percent and diesel consumption by 0.5 percent, but that the Recirculated Draft EIR fails to establish a threshold for fossil fuel consumption that would be significant. Therefore, the comment claims that the conclusion that the

increased fuel consumption resulting from project operation would not be significant is unsupported.

As discussed on page 4.5-8, the proposed project would result in energy usage associated with gasoline and diesel fuel consumed by project-related vehicle trips. Trip generation rates for the proposed project were based on the project's trip generation estimates, as identified in Section 4.10, Transportation, of the Recirculated Draft EIR, which estimates that the proposed project would generate approximately 1,920 average daily trips, including 1,578 vehicle trips and 342 truck trips. Based on the operational energy consumption estimates shown in Table 4.5.B, operation of the proposed project would increase the annual natural gas consumption in Fresno County by approximately 0.05 percent. Further, vehicle and truck trips associated with the proposed project would increase the annual fuel use in Fresno County by approximately 0.11 percent for gasoline fuel usage and approximately 0.05 percent for diesel fuel usage.

The comment claims that the City must determine the appropriate threshold against which to measure the project's fossil fuel consumption in order to determine whether the project will result in a significant impact to energy resources. However, as identified in Response B3-26 and as discussed in Section 4.5.3.1 of the Recirculated Draft EIR, thresholds for impacts related to energy used in the analysis are consistent with Appendix G of the *State CEQA Guidelines,* which states that development of the proposed project would result in a significant impact related to energy if it would: result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation; or conflict with or obstruct a State or local plan for renewable energy or energy efficiency. Further, there is no quantitative energy threshold under CEQA, and given that the gasoline and diesel fuel demand generated by vehicle trips associated with the proposed project would be a minimal fraction of gasoline and diesel fuel consumption in Fresno County, project gasoline and fuel demand would not be considered wasteful, inefficient, or unnecessary consumption.

Therefore, as demonstrated in Section 4.6, Energy, the proposed project would not result in inefficient, wasteful, and unnecessary consumption of energy and the project would not result in a significant energy impact. The commenter has not shown evidence of a potentially significant environmental impact.

Response B3-28: This comment claims that the Recirculated Draft EIR fails to accurately account for the project's trip generation, which would lead to increased fossil fuel and energy use.

Refer to Response B3-6 for a discussion of the project's trip generation. The trip generation for the proposed project was developed using rates from the WRCOG Study based on a trip generation study for high-cube fulfilment center facilities. As demonstrated in Response B3-6, the commenter is incorrect in stating that the trip generation assumptions substantially underestimated project trips.

Response B3-29: This comment states that another goal for conserving energy is increasing reliance on renewable energy sources and that the Recirculated Draft EIR's discussion of renewable energy generation is virtually nonexistent and fails to provide a meaningful investigation into renewable energy options that might be available or appropriate for the project. This comment also claims that compliance with the Building Code and other energy efficiency requirements does not, by itself, constitute an adequate assessment of measures that can be taken to address the energy impacts during construction and operation of the project.

As discussed on page 4.5-8 of the Recirculated Draft EIR, the proposed buildings would likely be constructed using the 2022 Title 24 standards; however, based on available modeling tools, the CalEEMod analysis of energy use assumed the construction of buildings based on the 2019 Title 24 standards, which is a conservative analysis. As discussed on page 4.5-8, Title 24 Standards contain energy efficiency requirements and establish performance metrics in the form of an "energy budget" based on energy consumption per square foot of floor space. For this reason, the Title 24 Standards include both a prescriptive option, allowing builders to comply by using methods known to be efficient, and a performance option, allowing builders complete freedom in their designs provided the building achieves the same overall efficiency as an equivalent building using the prescriptive option. Reference appendices are adopted along with the Title 24 Standards containing data and various compliance tools to help builders achieve compliance. As discussed in Response, B1-7, after approval and preparation of detailed building plans, the project would be required to demonstrate compliance with Title 24 using the CBECC model.

In addition, as discussed on pages 4.5-9 and 4.5-10 of the Recirculated Draft EIR, proposed new development would be constructed using energy-efficient modern building materials and construction practices, and the proposed project also would use new modern appliances and equipment, in accordance with the Appliance Efficiency Regulations (Title 20, CCR Sections 1601 through 1608). The expected energy consumption during construction and operation of the proposed project would be consistent with typical usage rates for industrial uses; however, energy consumption is largely a function of personal choice and the physical structure and layout of buildings.

PG&E is the private utility that would supply the proposed project's electricity and natural gas services. In 2021, a total of 50 percent of PG&E's delivered electricity came from renewable sources, including solar, wind, geothermal, small hydroelectric, and various forms of bioenergy.[1] PG&E reached California's 2020 renewable energy goal in 2017 and is positioned to meet the State's 60 percent by 2030 renewable energy mandate set forth in SB 100. In addition, PG&E plans to continue to provide reliable service to its customers and upgrade its distribution systems as necessary to meet future demand.

Further, as discussed in Response B3-26, Appendix F of the *State CEQA Guidelines* states that EIRs must include a discussion of the potential energy impacts of proposed projects, with particular emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy. As demonstrated in Section 4.6, Energy, the proposed project would not result in inefficient, wasteful, and unnecessary consumption of energy and would not result in a significant energy impact.

Response B3-30: This comment states that the Recirculated Draft EIR fails to disclose inconsistency with the City's General Plan, which would result in a significant adverse environmental impact on land use and planning. As discussed in Section 3.1.3, Existing Zoning and General Plan Land Use Designation, in the Recirculated Draft EIR, the project site is designated Heavy Industrial in the City of Fresno General Plan. This land use is intended to accommodate the broadest range of industrial uses, including manufacturing, assembly, wholesaling, distribution, and storage activities that are essential to the development of a balanced economic base. Small-scale commercial services and ancillary office uses are also permitted. The maximum FAR is 1.5. In addition, as discussed in the Initial Study (provided in Appendix B of the Recirculated Draft EIR), the proposed project would not require a change to the General Plan land use designation or the current zoning and would be consistent with the City's General Plan and Zoning Ordinance. Therefore, the project is consistent with the City's General Plan and would not result in a significant adverse environmental impact on land use planning.

Response B3-31: This comment asserts that the proposed project would exceed the City's Noise Element Policy NS-1-a Desirable and Generally Acceptable Exterior Noise Environment, which establishes 65 dBA day-night average level (L_{dn}) or CNEL as the standard for the desirable maximum average exterior noise levels for defined usable exterior areas of residential and noise-sensitive uses for noise, but designate 60 dBA L_{dn} or CNEL (measured at the property line) for noise generated by stationary sources impinging upon residential and noise-

[1] Pacific Gas and Electric (PG&E). 2022. *Exploring Clean Energy Solutions*. Website: https://www.pge.com/en_US/about-pge/environment/what-we-are-doing/clean-energy-solutions/clean-energy-solutions.page?WT.mc_id=Vanity_cleanenergy (accessed October 2022).

sensitive uses. The policy further states that they should maintain 65 dBA L_{dn} or CNEL as the maximum average exterior noise levels for non-sensitive commercial land uses, and maintain 70 dBA L_{dn} or CNEL as maximum average exterior noise level for industrial land uses, both to be measured at the property line of parcels where noise is generated that may impinge on neighboring properties.

As discussed in Response B3-24, the 65 dBA CNEL standard applies to new residential development as a land use compatibility standard when new residential development is proposed and is not an applicable threshold of significance for noise level increases. Because the proposed project would develop a new industrial use, the 65 dBA CNEL would not apply as a tool used to make a land use compatibility decision. Therefore, the commenter is incorrect that 65 dBA CNEL used for determining where residential uses may be placed is an applicable threshold.

Further, as it relates to potential noise impacts on surrounding residential uses due to traffic noise, the 65 dBA CNEL policy that is being referred to is derived from applying a 10 dBA penalty to nighttime noise level hourly standards presented in Section 10-102 of the Municipal Code to calculate a daily noise level. The Recirculated Draft EIR and supporting Noise Impact Analysis Memorandum (Appendix L of the Recirculated Draft EIR) provide an in-depth analysis of impacts to the residential uses to the south using the appropriate standards presented in Section 10-102 of the Municipal Code. With the implementation of MM NOI-2, operational noise levels would be less than significant.

For commercial uses during nighttime conditions (the more conservative conditions), the hourly noise level standard is 60 dBA L_{eq} and the anytime noise level for industrial uses is 70 dBA L_{eq}. As presented in the SoundPLAN printouts of the Noise Impact Analysis Memorandum (Appendix L of the Recirculated Draft EIR), the 60 dBA L_{eq} noise contour is within the site boundary to the east and west. At the northern property line, operational noise levels are expected to approach 64 dBA L_{eq}, which is below the 70 dBA L_{eq} standard for industrial uses. As such, the proposed project would not exceed maximum exterior noise level standards. Thus, the project complies with both absolute and relative noise level standards.

Response B3-32: This comment includes a number of recommendations to reduce impacts related to air quality and GHG and asserts that the DEIR fails to consider the Attorney General's Best Practices and mitigation for warehouse projects. Comments related to the design of the proposed project are noted. As discussed in Section 4.3, Air Quality, of the Recirculated Draft EIR, implementation of Mitigation Measure AIR-2 requires the use of Tier 4 construction equipment, consistent with the recommendations to require diesel-fueled off-road construction equipment to be equipped with CARB Tier

4-compliant engines. In addition, through implementation of Mitigation Measure AIR-3, the project applicant shall ensure that the proposed project would provide the infrastructure for AC and/or DC chargers for electric heavy-duty trucks. The infrastructure provided shall accommodate a minimum of one future charger per 50,000 square feet. Mitigation Measure AIR-3 is consistent with the recommendations relating to zero-emission heavy-duty vehicles. With implementation of Mitigation Measures AIR-2 and AIR-3, the proposed project's potential air quality impacts from construction and operation would not expose sensitive receptors to substantial pollutant concentrations and impacts would be less than significant. The comment does not present substantial evidence of the identification of a potentially significant environmental impact requiring additional mitigation.

Response B3-33: This comment claims that the City cannot make all of the findings for the proposed project, precluding approval of the project's land use permits. In addition, this comment claims that the project is inconsistent with the General Plan's Noise and Safety Element and is therefore inconsistent with the General Plan. Refer to Responses B3-24 and B3-25 for a discussion of consistency with the General Plan Noise Element. For the reasons explained in the responses above, the Recirculated Draft EIR properly evaluated the proposed project's potential impacts, and the commenter has not presented evidence to the contrary. Therefore, a revised EIR is not required.

Response B3-34: This comment claims that the project is likely to have potentially significant impacts related to transportation, air quality, health risk, GHG emissions, noise, energy, and land use and planning, and, as a result, would fail to comply with the Subdivision Map Act.

For the reasons explained in the responses above, the Recirculated Draft EIR properly evaluated the proposed project's potential impacts related to transportation, air quality, health risk, GHG emissions, noise, energy, and land use and planning, and the proposed project would not result in any significant and unavoidable impacts. The project complies with the Subdivision Map Act and is consistent with the General Plan and zoning as described in the Recirculated Draft EIR. The commenter has not presented evidence to the contrary.

Response B3-35: This comment states that the City must prepare a revised EIR for the proposed project. This comment is noted. For the reasons explained in the responses above, the Recirculated Draft EIR properly evaluated the proposed project's potential impacts, and the commenter has not presented evidence to the contrary. Therefore, a revised EIR is not required.

Response B3-36: This introductory comment is noted. This comment does not contain any substantive comments or questions about the environmental analysis or

conclusions contained in the Recirculated Draft EIR. Therefore, no further response is necessary.

Response B3-37: This comment provides a brief project description and does not contain any substantive comments or questions about the environmental analysis or conclusions contained in the Recirculated Draft EIR. Therefore, no further response is necessary.

Response B3-38: This introductory comment asserts that the Recirculated Draft EIR fails to adequately analyze significant environmental impacts. This comment is noted. Comments provided in this letter are further responded to below.

Response B3-39: This comment states that the Recirculated Draft EIR fails to address impacts from exposure to *Coccidiodes immitis* (Valley Fever cocci) from particulate matter released from the project site during construction activities.

Refer to Response B3-10. Background information regarding Valley Fever is discussed on pages 4.2-5 and 4.2-6 of the Recirculated Draft EIR. However, the air quality analysis contained in Section 4.2, Air Quality, of the Recirculated Draft EIR was prepared using the methodologies and assumptions contained in the SJVAPCD's GAMAQI. The GAMAQI does not include requirements or thresholds of significance for addressing Valley Fever. The closest sensitive receptors include the single-family residences approximately 110 feet south of the project site across West Nielsen Avenue. Except under high wind conditions, this distance is sufficient that particulate matter will settle prior to reaching the nearest sensitive receptor. In addition, crosswinds influenced by adjacent traffic intersections would help dissipate any particulate matter associated with the construction phase of the project. Therefore, any Valley Fever spores suspended with the dust will not reach the sensitive receptors. However, during project construction, it is possible that workers could be exposed to Valley Fever through fugitive dust. Dust control measures, consistent with SJVAPCD Regulation VIII (as required by Mitigation Measure AIR-1), would reduce the exposure of the workers. Dust from the construction of the project is not anticipated to exacerbate or significantly add to the existing exposure of people to Valley Fever.

Response B3-40: This comment claims that the Recirculated Draft EIR fails to include adequate mitigation measures and medical monitoring information to prevent exposure to *Coccidiodes immitis* (Valley Fever cocci) from disturbed soils on site. This comment also recommends the inclusion of several mitigation measures in the Recirculated Draft EIR.

Refer to Responses B3-10 and B3-39, above. The GAMAQI does not include requirements or thresholds of significance for addressing Valley Fever. Further, dust control measures, consistent with SJVAPCD Regulation VIII (as required by Mitigation Measure AIR-1), would reduce the exposure of the

workers. Dust from the construction of the project is not anticipated to exacerbate or significantly add to the existing exposure of people to Valley Fever. Implementation of the proposed project would not exceed any applicable SJVAPCD significance criteria and would result in a less than significant impact; the commenter has not presented evidence to the contrary. As such, identification and analysis of mitigation measures suggested in the comment would not be required to reduce emissions to a less than significant level.

Response B3-41: This comment states that the air quality analysis contained in the Recirculated Draft EIR did not include emissions from an on-site fire pump system.

As discussed in the Recirculated Draft EIR, the proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. However, as discussed in Responses A4-6 and B3-7, to be conservative, a supplemental analysis to evaluate potential emissions associated with equipment, emergency backup generators, and diesel fire pumps was conducted using CalEEMod. This supplemental analysis conservatively assumed that 40 diesel-powered forklifts would be used for 8 hours per day and that four diesel-powered 500 HP emergency backup generators and four diesel-powered 500 HP diesel fire pumps would be used for up to 50 hours per year. The results of the supplemental analysis indicate that the use of equipment, emergency backup generators, and diesel fire pumps would not exceed the significance criteria for annual ROG, NO_X, CO, SO_X, PM_{10}, or $PM_{2.5}$ emissions. Because emissions would still be below the SJVAPCD's thresholds, operational emissions would still be considered less than significant. However, it is important to note that diesel fire pumps have not been identified as part of the project and are not included as part of the proposed project evaluated in this Recirculated Draft EIR.

Response B3-42: This comment claims that the air quality analysis contained in the Recirculated Draft EIR fails to consider the use of refrigeration units and transport refrigeration units (TRUs), resulting in underestimated foreseeable health risk to the community as well as associated GHG emissions.

The air quality analysis contained in the Recirculated Draft EIR assumed the trucks accessing the project site would idle using their main engines rather than an auxiliary power unit or plugging in to on-site electrical hookups throughout their time at the project site. This is a conservative assumption, as the loading docks are required to have electrical hookups and the trucks to have the ability to run their accessories from that electricity during any extended period of idling, so it is likely that the trucks would only briefly operate on their own power when maneuvering on site. It was also assumed that any refrigerated trucks would use the electrical hookups to power the

TRUs rather than operate their onboard diesel engines. Additionally, the CARB has developed a technical advisory to transition to near-zero-emission technologies and ultimately zero-emission technologies. These technologies will be phased in over time, possibly beginning in the 2020s and extending out to 2050. As such, because TRU trucks would be required to plug in, any increase in emissions associated with TRUs would be minimal and would not result in a significant increase in emissions. Therefore, no revisions to the analysis in the Recirculated Draft EIR are warranted.

Response B3-43: This comment states that the Recirculated Draft EIR states that the proposed project would result in a total of 1,920 average daily trips, including 1,578 passenger vehicle trips and 342 truck trips. This comment also claims that Appendix C of the Recirculated Draft EIR shows a total of 1,589 passenger vehicle trips per day.

Appendix C of the Recirculated Draft EIR contains the CalEEMod output sheets, which estimate that the proposed project would result in a total of 1,920 average daily trips. Appendix D of the Recirculated Draft EIR contains the HRA and its model output. The model output contained in Appendix D of the Recirculated Draft EIR does estimate 1,589 daily passenger vehicle trips and 344 truck trips, resulting in a total of 1,933 average daily trips. The proposed project's estimated trip generation is slightly less than the trip generation evaluated in the HRA; therefore, the analysis is conservative and likely overestimates operational project emissions. No revisions to the analysis in the Recirculated Draft EIR are warranted.

Response B3-44: This comment suggests that the Recirculated Draft EIR underestimates trip generation.

Refer to Response B3-5. As discussed in the TIS in Appendix M of the Recirculated Draft EIR, the trip generation for the proposed project was developed using rates from the WRCOG Study, which is included as an appendix to the TIS (Appendix M of the Recirculated Draft EIR). The study provides separate trip generation rates for passenger vehicles, 2- to 4-axle trucks, and 5+ axle trucks. The truck trips were converted to PCE trips using a PCE factor of 2.0 for 2- to 4-axle trucks, consistent with HCM recommendations. However, as a conservative approach, a PCE factor of 3.0 was used for 5+ axle trucks, consistent with the practices in several regions within the State. This methodology is also consistent with the recommended trip generation estimate methodology by ITE, which recommends using average trip generation rates for land uses. The WRCOG Study found that for larger projects, percentages of truck trips compared to total trips are lower than for a fulfillment center of a smaller size. Therefore, the commenter is incorrect in stating that the trip generation assumptions underestimated project trips.

Response B3-45: This comment claims that the Recirculated Draft EIR failed to account for the impact on emissions from building downwash, resulting in an underestimation of exposure concentrations.

Refer to Response B3-17. The SJVAPCD Guidance suggests that building downwash effects be included. The commenter incorrectly states that the EIR fails to account for building downwash. In fact, the modeling conducted for the project included building downwash, as recommended by the SJVAPCD. The image included in Response B3-17 shows a snapshot of the model and a 3-D representation of the building heights that were used to model the downwash effect. The model was made available to the public for review and download at the City. As such, the HRA represents an accurate representation of the project, and the disclosed emissions are accurate.

Response B3-46: This comment states that the air quality analysis contained in the Recirculated Draft EIR failed to account for backup generators.

The proposed project would not involve the use of backup generators. As discussed in the Recirculated Draft EIR, the proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. Therefore, such equipment has not been identified and is not included as part of the proposed project.

However, as discussed in Responses A4-6 and B3-7, to be conservative, a supplemental analysis to evaluate potential emissions associated with equipment, emergency backup generators, and diesel fire pumps was conducted using CalEEMod. This supplemental analysis conservatively assumed that 40 diesel-powered forklifts would be used for 8 hours per day and that four diesel-powered 500 HP emergency backup generators and four diesel-powered 500 HP diesel fire pumps would be used for up to 50 hours per year. The results of the supplemental analysis indicate that the use of equipment, emergency backup generators, and diesel fire pumps would not exceed the significance criteria for annual ROG, NO_X, CO, SO_X, PM_{10}, or $PM_{2.5}$ emissions. Because emissions would still be below the SJVAPCD's thresholds, operational emissions would still be considered less than significant. However, it is important to note that emergency backup generators are not being proposed as part of the project.

Response B3-47: This comment claims that the City must prepare a revised EIR for the proposed project. This comment is noted. For the reasons explained in the responses above, the Recirculated Draft EIR properly evaluated the proposed project's potential impacts, and the commenter has not presented evidence to the contrary. Therefore, a revised EIR is not required.

Response B3-48: This comment includes the commenter's resume. The comment is noted, but it does not raise any significant environmental issues related to the project or the analysis contained in the Recirculated Draft EIR.

Response B3-49: This introductory comment is noted. This comment does not contain any substantive comments or questions about the environmental analysis or conclusions contained in the Recirculated Draft EIR. Therefore, no further response is necessary.

Response B3-50: This comment includes the commenter's qualifications. The comment is noted, but it does not raise any significant environmental issues related to the project or the analysis contained in the Recirculated Draft EIR.

Response B3-51: This comment is a statement of references presenting a summary related to the adverse effects of noise. The comment is noted, but it does not raise any significant environmental issues related to the project or the analysis contained in the Recirculated Draft EIR.

Response B3-52: This comment summarizes comments previously provided on the Initial Study prepared for the proposed project. This comment is noted and is responded to further in Responses B3-53 through B3-59.

Response B3-53: This comment presents Policy NS-1-a of Fresno General Plan, Chapter 9, Noise and Safety, and states that it is important that cities like Fresno adopt absolute standards for the noise environments of their citizens because if only relative standards are used, then there would be no limit to environmental noise exposure over time. In addition, this comment claims that the FTA also recognizes that as the absolute level of noise exposure increases, the relative increase that results in a significant impact reduces.

Refer to Responses B3-2 and B3-31, above. As identified on page 4.9-13 of the Recirculated Draft EIR, as established in General Plan Policy NS-1-j: Significance Threshold, the City considers a 3 dBA increase to be a significant increase in ambient noise. There is currently no General Policy stating that a less than 3 dBA increase resulting in levels going from below 65 dBA CNEL to above 65 dBA CNEL would constitute a significant impact. As such, traffic noise impacts from project-related traffic on off-site sensitive receptors would be less than significant.

Response B3-54: This comment presents information extracted from Table 4.9.L in the Recirculated Draft EIR. This comment states that the noise exposure goes from a level that is lower than that established by General Plan Policy NS-1-a (65 dBA CNEL) to one that is higher, constituting a significant noise impact.

Refer to Responses B3-24 and B3-31. As identified on page 4.9-13 of the Recirculated Draft EIR, as established in General Plan Policy NS-1-j:

Significance Threshold, the City considers a 3 dBA increase to be a significant increase in ambient noise. As such, traffic noise impacts from project-related traffic on off-site sensitive receptors would be less than significant.

Response B3-55: This comment asserts that the Recirculated Draft EIR only calculated the composite noise level of the two loudest pieces of equipment for each construction phase. The comment claims that is a common error that stems from FTA guidance that preliminarily, before much is known about construction, the order of magnitude of construction noise may be determined by combining the levels of the two loudest pieces of equipment, assuming they are running at full power 100 percent of the time. The comment also claims that the types and number of equipment are known in detail from the air quality assessment, so it is appropriate to conduct a detailed calculation of construction noise. The commenter also claims that the calculation include in the Recirculated Draft EIR does not assume usage 100 percent of the time for the two loudest pieces of equipment, so it does not even comport with the FTA preliminary guidance. Refer to Response B3-25, above.

Response B3-56: This comment asserts that the commenter properly estimated noise levels using the CalEEMod output contained in Appendix C of the Recirculated Draft EIR and based on the reference emission levels and usage factors from Table 4.9.K of the Recirculated Draft EIR. This comment also states that the average acoustical distance used for the calculations is, as the Recirculated Draft EIR explains, calculated by multiplying the shortest distance between the receiver and the noise source area by the farthest distance, and then taking the square root of the product, which is 471 feet. Refer to Response B3-25, above.

Response B3-57: This comment states that construction noise levels would result in an increase over the 5 dBA threshold of significance identified in the Recirculated Draft EIR. Refer to Response B3-25, above.

Response B3-58: This comment states that Mitigation Measure NOI-1 requires the use of mufflers and the designation of a “disturbance coordinator.” The commenter states that while both of these are good ideas that should be implemented, neither would reduce the noise levels. Refer to Response B3-25, above.

Response B3-59: This comment includes the commenter’s calculation of construction noise level increases. Refer to Response B3-25, above.

Response B3-60: This comment includes a conclusion and a summary of the comments provided in the letter. This comment is noted. For the reasons explained in the responses above, the Recirculated Draft EIR properly evaluated the proposed project’s potential impacts, and the commenter has not presented evidence to the contrary.

Response B3-61: This comment provides a closing to the comment letter and does not question the adequacy of the analysis included in the Recirculated Draft EIR. No further response is required.

Response B3-62: This comment provides an introduction to following comments, which are responded to further in Responses B3-63 through B3-66.

Response B3-63: This comment states that the project's trip generation could be much higher than assumed as the different fulfillment center sites have different trip generation rates, with an Amazon facility having an especially high rate. This comment also suggests that the Recirculated Draft EIR apply the Amazon trip generation rate.

Refer to Response B3-6. As discussed in the Recirculated Draft EIR, the proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. However, the project applicant has confirmed an Amazon facility is not under consideration to be a possible tenant. Since Amazon has not been identified as a tenant, using Amazon trip generation rates would not be accurate or applicable to the proposed project. The suggestion that Amazon trip generation rates would more accurately reflect the project's impacts is therefore speculative and unsupported by substantial evidence. (See CEQA Guidelines, § 15064, subd. (f)(5).) It should also be noted that Amazon has multiple existing facilities already located in Fresno. It is possible that Amazon could build another facility in Fresno; however, Amazon is not expected to locate another facility at the project site. (See id. at § 15145.)

As discussed in the TIS, trip generation rates from the ITE manual for the High-Cube Fulfillment Center Warehouse land use have a small sample size. The WRCOG Study facilitated a trip generation study for such facilities. Further, trip generation rates using the WRCOG study are higher than trip generation rates from the ITE manual for the High-Cube Fulfillment Center Warehouse land use. As such, trip generation rates from the WRCOG Study are conservative and are appropriate for use. The WRCOG Study provides separate trip generation rates for passenger vehicles, 2- to 4-axle trucks, and 5+ axle trucks. The truck trips were converted to PCE trips using a PCE factor of 2.0 for 2- to 4-axle trucks, consistent with HCM recommendations. However, as a conservative approach, a PCE factor of 3.0 was used for 5+ axle trucks, consistent with the practices in several regions within the State. Additionally, as established in the WRCOG Study, the Amazon facility is an outlier. However, as further noted, that facility was also included to calculate the average trip generation rates for High-Cube Fulfilment Center Warehouse land uses. This methodology is also consistent with the recommended trip generation estimate methodology by ITE, which recommends using average trip generation rates for land uses. The WRCOG Study found that for larger

projects, percentages of truck trips compared to total trips are lower than a fulfillment center of a smaller size. Therefore, the commenter is incorrect in stating that the trip generation assumptions substantially underestimated project trips.

Response B3-64: This comment claims that project VMT and GHG emissions could be much higher than assumed because if the Amazon trip generation rate were used instead, the VMT output from CalEEMod would be twice as high. If the parcel hub rate were used, the VMT output would six times as high.

As described in Responses B3-6, B3-12, B3-13, B3-14, and B3-15, the traffic assumptions are supported by substantial evidence further explained in the TIS that was prepared for the project, included in Appendix M of the Recirculated Draft EIR. The Technical Memorandum prepared by WSP and dated January 29, 2019, which was included as an appendix to the TIS, explains in great detail the basis for the trip generation rates used in the traffic analysis and air quality analysis. Further, the air quality analysis did not incorporate the VMT from the TIS as the VMT analysis for SB 743 uses a different methodology for air quality. The air quality analysis utilized default trip lengths provided in CalEEMod. Refer to Response A4-3 for a detailed discussion of CalEEMod default assumptions. As demonstrated in Response A4-3, since a project-specific truck trip length is not yet known, the use of CalEEMod defaults is appropriate for projects in the SJVAPCD and the city of Fresno and is consistent with standard practice. As such, the project's air quality analyses used the correct trip generation and VMT assumptions.

Further, the commenter states that GHG emissions could be much higher than assumed. However, as described in Response 2-2, the City evaluated the proposed project using the Consistency Checklist for consistency with the City's GHG Reduction Plan Update as discussed on pages 4.6-22 and 4.6-23 of the Recirculated Draft EIR. The project's Consistency Checklist is included in Appendix H of the Recirculated Draft EIR. As shown in the Consistency Checklist, the proposed project would be consistent with the applicable strategies from the GHG Reduction Plan Update. Therefore, the proposed project would not generate GHG emissions, either directly or indirectly, that may have a significant effect on the environment, and impacts would be less than significant.

Response B3-65: This comment claims that a significant percentage of Fresno County trips have origins or destinations that are outside the county and claims that the Recirculated Draft EIR excluded all VMT outside of the county.

The commenter is incorrect in stating that the VMT analysis did not include or fully evaluate trips that originate/are destined outside Fresno County. As shown in Appendix G of the traffic study, the project VMT included employee trips that originated/were destined outside of Fresno County (internal-

external/external-internal trips). Therefore, the project VMT estimates accounted for trips originating from outside the Fresno COG ABM region as well.

In addition, as discussed in Response B3-14, truck trips were not included in the VMT analysis, consistent with the CEQA Guidelines Section 15064.3, subdivision (a), which states, "For the purposes of this section, 'vehicle miles traveled' refers to the amount and distance of automobile travel attributable to a project." The technical guidance from OPR does say that heavy-duty truck VMT "*could be included*"; however, the Guidance goes on to state that this would be for modeling convenience and ease of calculation. Heavy-duty trucks are not included in the CEQA Guidelines for VMT analysis, are not included in the Fresno COG model, and therefore were not included in the VMT analysis. "An agency's use of a reasonable standard for gauging the significance of an impact may not be set aside on the ground the impact would have been found significant if other recognized standards had instead been used."

Response B3-66: This comment asserts that transportation demand management strategies, including implementation of pedestrian, bicycle, and transit linkages with surrounding land uses and neighborhoods and trip reduction programs consistent with SJVAPCD Rule 9410.

As discussed on page 4.10-11 of the Recirculated Draft EIR, there are no existing dedicated transit facilities within the study area for the proposed project. The proposed project is not located in an important transit corridor in the city; therefore, it is not anticipated that the construction of additional transit facilities would be required in the study area as a result of the proposed project. Further, as discussed on page 4.10-11, there are existing Class II bike lanes along Marks Avenue and Nielsen Avenue within the study area for the proposed project, in the vicinity of the project site. Pursuant to the City's Active Transportation Plan, future Class II bike lanes will be added along Belmont Avenue and Hughes Avenue within the project study area to improve bicycle and pedestrian accessibility and connectivity in the vicinity of the project site. In addition, as discussed on page 4.10-11, paved sidewalks are currently present intermittently on both sides of Belmont Avenue and Marks Avenue. Pursuant to the City's Active Transportation Plan, the City recommends pedestrian sidewalks to be constructed on Marks Avenue, Nielsen Avenue, Belmont Avenue, and Hughes Avenue within the study area. The proposed project would construct sidewalks along the project frontage on Marks Avenue, Nielsen Avenue, and Hughes Avenue. Sidewalks would be constructed pursuant to City standards and would increase pedestrian access and safety in the study area. Therefore, the commenter is incorrect that the Recirculated Draft EIR does not discuss bicycle and transit linkages with surrounding land uses and neighborhoods.

In addition, as discussed in Response A4-18, the proposed project would comply with all required SJVAPCD rules and regulations. In addition, as identified in Appendix H, Greenhouse Gas Reduction Plan Update Checklist, of the Recirculated Draft EIR, the project would have over 100 employees and would be required to comply with SJVAPCD Rule 9410.

Response B3-67: This comment includes the commenter's resume. The comment is noted, but it does not raise any significant environmental issues related to the project or the analysis contained in the Recirculated Draft EIR.

4.0 RECIRCULATED DRAFT EIR TEXT REVISIONS

This chapter presents specific changes to the text of the Recirculated Draft EIR that are being made to clarify any errors, omissions, or misinterpretation of materials in the Recirculated Draft EIR in response to comments received during the public review period and clarifications that are City-initiated. In no case do these revisions result in a greater number of impacts or impacts of a greater severity than those set forth in the Recirculated Draft EIR. Further, the clarifications and corrections provided in the following revisions do not constitute significant new information requiring recirculation of the Recirculated Draft EIR. Where revisions to the main text are called for, the page and paragraph are set forth, followed by the appropriate revision. Added text is indicated with double-underlined text, and deleted text is shown in strikeout.

4.1 SECTION 4.2, AIR QUALITY

The following text revision is made to page 4.2-35 of the Recirculated Draft EIR:

> For this HRA, the truck travel emissions were modeled as a series of volume sources along the on-site driveway~~, and~~ along ~~East~~North Marks Avenue going north and south of the site driveway, and along West Nielsen Avenue going east and west of the site driveway consistent with standard methodology.

4.2 SECTION 4.8, HYDROLOGY AND WATER QUALITY

The following text revision was made to page 4.8-13 of the Recirculated Draft EIR:

> ~~Project-specific~~The City's projected future water demand was calculated using the methodology from the 2020 UWMP, as described above, based on the following assumptions:
>
> - Figure 4-3 of the 2020 UWMP indicates there will be 5,201 acres of industrial uses in Fresno in 2025.
>
> - Table 4-6 of the 2020 UWMP indicates the projected water demand for industrial land uses in 2025 will be 7,410 AFY.
>
> Therefore, ~~it is~~the 2020 UWMP assumed that industrial land uses~~, such as the proposed project,~~ will demand approximately 1.42 AFY per acre in 2025. The total project site is 48.03 acres~~.~~; t~~T~~herefore, based on the assumptions for water demand associated with industrial land uses identified above, the ~~proposed project is~~2020 UWMP estimated ~~to demand~~ approximately 68.2 AFY for the project site.
>
> The project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. In addition, at this time, the specific number of employees is not yet known. As such, the proposed project's water demand was calculated based on the

Water Study Demand Manual[1], which estimates that industrial uses demand approximately 0.9 acre-feet per year (AFY) per acre. The proposed project site is 48.03 acres; therefore, the proposed project is estimated to demand approximately 43.23 AFY. As such, the proposed project's water demand is below the 68.2 AFY planned for the project site in the 2020 UWMP.

4.3 SECTION 4.11, UTILITIES AND SERVICE SYSTEMS

The following text revision is made to page 4.11-5 of the Recirculated Draft EIR:

The FMFCD drainage area for stormwater from the project site is ~~b~~Basin Drainage Areas "AS" and "ZZ"~~, located southwest from the site~~.

The following text revision is made to page 4.11-14 of the Recirculated Draft EIR:

Once operational, water service to the project site would be provided by the City. New water within the project site would connect to the existing 14-inch main located on North Marks Avenue~~, and~~ the 16-inch main on North Hughes Avenue, and the 14-inch main on West Nielsen Avenue. The project would also include an on-site private 12-inch water main. Extension of the water infrastructure from the adjacent streets into the project site would be a routine part of the construction process analyzed in this EIR and would not have a material environmental impact. The water facility improvements would be limited to the project site and connection points to the adjacent, existing facilities. In addition, as described further in Threshold 4.11.2 below, the City has concluded that the City of Fresno's water system has sufficient capacity to supply the proposed project and other projected demands within the City's service area through the year 2045. Therefore, the proposed project would not require or result in the construction of new water facilities, or the expansion of existing facilities, which could cause a significant environmental impact, and the impact would be less than significant.

The following text revision is made to page 4.11-14 of the Recirculated Draft EIR:

Once operational, the City would provide wastewater collection and treatment for the proposed project, and maintains an existing 12- to 18-inch line located ~~in~~on West Nielsen Avenue, a 36-inch main on North Marks Avenue, and an 8-inch main on North Hughes Avenue. The proposed project includes the installation of a new on-site private 8-inch wastewater line that would connect to the City's existing line. Any sewer improvements associated with the proposed project would be designed and constructed to City standards. In addition, the City of Fresno Department of Public Utilities has determined that adequate sanitary sewer and wastewater services would be available to serve the proposed project subject to the payment of any applicable connection charges and/or fees and extension of services in a manner that is compliant with the Department of Public Utilities standards, specifications, and

[1] Sacramento, City of. 2018. *Water Study Demand Manual*. January.

policies. In addition, as described further in Threshold 4.11.2 below, the City has concluded that the City of Fresno's wastewater system has sufficient capacity to supply the proposed project and other projected demands within the City's service area through the year 2045. As such, the proposed project would result in less than significant impacts related to the construction or expansion of wastewater treatment facilities. Therefore, the proposed project would not require or result in the construction of new wastewater treatment or collection facilities, or the expansion of existing facilities, which could cause a significant environmental impact. Therefore, the impact would be less than significant.

The following text revision is made to page 4.11-18 of the Recirculated Draft EIR:

~~Project-specific~~The City's projected future water demand was calculated using the methodology from the 2020 UWMP, as described above, based on the following assumptions:

- Figure 4-3 of the 2020 UWMP indicates there will be 5,201 acres of industrial uses in Fresno in 2025.
- Table 4-6 of the 2020 UWMP indicates the projected water demand for industrial land uses in 2025 will be 7,410 AFY.

Therefore, ~~it is~~the 2020 UWMP assumed that industrial land uses~~, such as the proposed project,~~ will demand approximately 1.42 AFY per acre in 2025. The total project site is 48.03 acres~~.~~; t~~T~~herefore, based on the assumptions for water demand associated with industrial land uses identified above, the ~~proposed project is~~2020 UWMP estimated ~~to demand~~ approximately 68.2 AFY for the project site.

The project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. In addition, at this time, the specific number of employees is not yet known. As such, the proposed project's water demand was calculated based on the Water Study Demand Manual[1], which estimates that industrial uses demand approximately 0.9 acre-feet per year (AFY) per acre. The proposed project site is 48.03 acres; therefore, the proposed project is estimated to demand approximately 43.23 AFY. As such, the proposed project's water demand is below the 68.2 AFY planned for the project site in the 2020 UWMP.

4.4 APPENDIX K, WATER SUPPLY ASSESSMENT

The following text revision is made to page 1 of Appendix K, Water Supply Assessment, of the Recirculated Draft EIR:

[1] Sacramento, City of. 2018. *Water Study Demand Manual*. January.

EXECUTIVE SUMMARY

The proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. As such, the project-specific water usage is not yet known. Project-specific water demand was calculated based on the Water Study Demand Manual[1], which estimates that industrial uses demand approximately 0.9 acre-feet per year (AFY) per acre. The proposed project site is 48.03 acres; therefore, the proposed project is estimated to demand approximately 43.23 AFY.

The project water demand evaluated in this WSA will be compared to the water service planned for future industrial uses in the City using the City's adopted 2020 UWMP methodologies, which was calculated on the basis of the following assumptions:

- Figure 4-3 of the 2020 UWMP indicates there will be 5,201 acres of industrial uses in Fresno in 2025.
- Table 4-6 of the 2020 UWMP indicates the projected water demand for industrial land uses in 2025 will be 7,410 AFY.

Therefore, is the 2020 UWMP assumed that industrial land uses, will demand approximately 1.42 AFY per acre in 2025. The total project site is 48.03 acres; therefore, based on the assumptions for water demand associated with industrial land uses identified above, the 2020 UWMP estimated approximately 68.2 AFY for the project site.

As identified above, the proposed project is estimated to demand approximately 43.23 AFY. As such, the proposed project's water demand is below the 68.2 AFY planned for the project site in the 2020 UWMP.

Since land use acreages and water demand in the 2020 UWMP were based on the City's General Plan land use designations for 2020 and buildout in 2056 and since the acreage associated with the proposed project was assumed Industrial in the 2020 UWMP, this WSA assumes that demand for water was accounted for in the 2020 UWMP. There is no evidence, in consideration of the calculated project water demand, that such demand exceeds that estimated in the 2020 UWMP. The adequacy of the water supply for the project is thus consistent with the basis of the analysis of the City's water supply in the adopted 2020 UWMP.

As such, this WSA concluded that the City of Fresno's water system has sufficient capacity to supply the proposed project and other projected demands within the City's service area through the year 2045.

[1] Sacramento, City of. 2018. *Water Study Demand Manual*. January.

The following text revision is made to page 5 of Appendix K, Water Supply Assessment, of the Recirculated Draft EIR:

> The project site is located in an urban area and is currently served by existing utilities, including: water, sanitary sewer, storm drainage, electricity, and natural gas infrastructure. Water service to the project site would be provided by the City. New water within the project site would connect to the existing 14-inch main located on North Marks Avenue, ~~and~~ the 16-inch main on North Hughes Avenue, and the 14-inch main on West Nielsen Avenue. The project would also include an on-site private 12-inch water main. The City would provide wastewater collection and treatment for the proposed project, and maintains an existing 12- to 18-inch line located ~~in~~on West Nielsen Avenue, a 36-inch main on North Marks Avenue, and an 8-inch main on North Hughes Avenue. The proposed project includes the installation of a new on-site private 8-inch wastewater line that would connect to the City's existing lines. The proposed project would include construction of a new curb and gutter along North Marks Avenue, West Nielsen Avenue, and North Hughes Avenue that would connect to the existing Fresno Metropolitan Flood Control District (FMFCD) stormwater system.

The following text revision is made to page 6 of Appendix K, Water Supply Assessment, of the Recirculated Draft EIR:

> The City of Fresno relies on groundwater from the North Kings Subbasin; surface water from the Central Valley Project (CVP), through a contract with the United States Bureau of Reclamation (USBR); Kings River water, through a contract with Fresno Irrigation District (FID); and recycled water to meet current and future water demands. The information provided on the following pages ~~are~~is extracted directly from the 2020 UWMP (Pages 6-1 through 6-32) in satisfaction of Water Code sections 10910(A)(1) and 10910(D)(2). This information is applicable to the entire City of Fresno municipal water service area, including the project site.

The following text revision is made to page 18 of Appendix K, Water Supply Assessment, of the Recirculated Draft EIR:

> As such, the supply projections in this plan limit the City's FID supply with the 29.0 percent cap~~, but if the agreement were revised in the future the City's FID allocation percentage could grow beyond 29.0 percent as the water service area expands~~.

The following text revision is made to page 45 of Appendix K, Water Supply Assessment, of the Recirculated Draft EIR:

> **Assumptions**
>
> ~~Project specific~~The City's projected future water demand was calculated using the methodology from the 2020 UWMP, as described above, based on the following assumptions:

- Figure 7 above (Figure 4-3 of the 2020 UWMP) indicates there will be 5,201 acres of industrial uses in Fresno in 2025.

- Table M above (Table 4-6 of the 2020 UWMP) indicates the projected water demand for industrial land uses in 2025 will be 7,410 AFY.

Therefore, ~~it is~~the 2020 UWMP assumed that industrial land uses~~, such as the proposed project,~~ will demand approximately 1.42 AFY per acre in 2025. The total project site is 48.03 acres; therefore, based on the assumptions for water demand associated with industrial land uses identified above, the 2020 UWMP estimated approximately 68.2 AFY for the project site.

Proposed Project Water Demand

~~The total project site is 48.03 acres. Therefore, based on the assumptions identified above, the proposed project is estimated to demand approximately 68.2 AFY.~~The project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. In addition, at this time, the specific number of employees is not yet known. As such, the proposed project's water demand was calculated based on the Water Study Demand Manual[1], which estimates that industrial uses demand approximately 0.9 AFY per acre. The proposed project site is 48.03 acres; therefore, the proposed project is estimated to demand approximately 43.23 AFY. As such, the proposed project's water demand is below the 68.2 AFY planned for the project site in the 2020 UWMP.

APPENDIX A

COMMENT LETTER B3 ATTACHMENTS

This page intentionally left blank

EXECUTIVE DEPARTMENT
STATE OF CALIFORNIA

PROCLAMATION OF A STATE OF EMERGENCY

WHEREAS beginning on June 16, 2021, a significant heat wave struck California, bringing widespread near-record temperatures well in excess of 100 degrees throughout the State (the "Extreme Heat Event"); and

WHEREAS as a result of this Extreme Heat Event, the National Weather Service issued an Excessive Heat Warning within the State; and

WHEREAS the Extreme Heat Event has and will continue to put significant demand and strain on California's energy grid; and

WHEREAS on June 16, 2021, the California Independent System Operator (CAISO) issued a Flex Alert, calling for voluntary electricity conservation from 5:00 PM to 10:00 PM on June 17, 2021 to mitigate impact to energy supplies during this Extreme Heat Event; and

WHEREAS the Extreme Heat Event is expected to last through at least June 18, 2021; and

WHEREAS it is necessary to take action to reduce the strain on the energy infrastructure and increase energy capacity during the Extreme Heat Event; and

WHEREAS it is critical that power plants in the State generate as much power as possible to satisfy the increased demand created by the Extreme Heat Event; and

WHEREAS under the provisions of Government Code section 8558, subd. (b), I find that conditions of extreme peril to the safety of persons and property exist due to the Extreme Heat Event throughout California; and

WHEREAS under the provisions of Government Code section 8625, subd. (c), I find that local authority is inadequate to cope with the magnitude and impacts of the Extreme Heat Event; and

WHEREAS under the provisions of Government Code section 8571, I find that strict compliance with various statutes and regulations specified in this Order would prevent, hinder, or delay appropriate actions to prevent and mitigate the effects of the Extreme Heat Event.

NOW, THEREFORE, I, GAVIN NEWSOM, Governor of the State of California, in accordance with the authority vested in me by the State Constitution and statutes, including the California Emergency Services Act, and in particular, Government Code sections 8567, 8571, 8625, and 8627, **HEREBY PROCLAIM A STATE OF EMERGENCY** to exist in California.

IT IS HEREBY ORDERED THAT:

1. In preparing for and responding to the Extreme Heat Event, all agencies of state government use and employ state personnel, equipment, and facilities or perform any and all activities consistent with the direction of the Governor's Office of Emergency Services and the State Emergency Plan. Also, all residents are to obey the direction of emergency officials with regard to this emergency in order to protect their safety.

2. For purposes of regulations concerning stationary generators, use of stationary generators during the Extreme Heat Event shall be deemed an "emergency use" under California Code of Regulations (CCR), title 17, section 93115.4, subd. (a)(30)(A)(2).

3. For purposes of regulations concerning portable generators, the Extreme Heat Event shall be deemed an "emergency event" under CCR, title 17, section 93116.1, subd. (b)(14), and a loss of electrical service shall be deemed "beyond the reasonable control of the owner or operator" under CCR, title 17, section 93116.2, subd. (a)(12)(A)(2). In addition, the Extreme Heat Event shall be deemed an "emergency event" under CCR, title 13, section 2452, subd. (j), and interruptions caused by the Extreme Heat Event shall be deemed an "unforeseen interruption of electrical power from the serving utility" under CCR, title 13, section 2453, subd. (m)(4)(E)(1).

4. In regulations concerning the use of auxiliary engines by ocean-going vessels berthed in California ports, the Extreme Heat Event shall be deemed an "emergency event" under CCR, title 17, section 93118.3, subd. (c)(14).

5. This Order shall be deemed to provide notice to reduce use of grid-based electrical power under CCR, title 17, section 93118.3, subd. (c)(14)(C), and notice under that same section that reduction is no longer necessary at 11:59 p.m. on June 19, 2021. Ships that are berthed at California ports between June 16, 2021 and June 19, 2021 shall not be required to use shore power until after 11:59 pm on June 22, 2021.

6. A ship operating on auxiliary engines pursuant to an "emergency event" under Paragraph 4 of this Order shall be deemed to qualify for an exemption under CCR, title 17, section 93118.3, subd. (d)(1)(E)(1)(a), and any visit occurring during the period described in Paragraph 5 of this Order shall be counted towards compliance under CCR, title 17, section 93118.3, subd. (d)(1)(F)(1).

7. The Air Resources Board shall exercise maximum discretion to permit the use of stationary and portable generators or auxiliary ship engines to reduce the strain on the energy infrastructure and increase energy capacity during the Extreme Heat Event.

8. The provisions of Water Code section 13385, subd. (i)(1)(A) as they pertain to daily average and instantaneous temperature limitations in waste discharge requirements for thermal power plants are suspended for any thermal power plant that maintains operations to abate the effects of the Extreme Heat Event. Any exceedance of the daily average or instantaneous temperature limitations resulting from maintaining operations during this time shall not constitute a violation for purposes of calculating mandatory minimum penalties under Water Code section 13385, subd. (i).

9. Permitting requirements or conditions of certification adopted by the Energy Commission pursuant to Public Resources Code, sections 25216.5, subd. (a) and 25500 et seq., as well as related permitting requirements adopted by local air quality management districts, that restrict the amount of power that a facility may generate, restrict the amount of fuel that a facility may use, or impose air quality requirements that prevent the facility from generating additional power during peak demand hours, from 3:00 p.m. to 10:00 p.m. or as otherwise needed to respond to the Extreme Heat Event, are suspended.

10. Any facility that operates in violation of permitting requirements or conditions of a certificate suspended by Paragraph 9 shall:

    (i) notify the relevant local air quality management district, the Energy Commission, and the Air Resources Board of its actions within 48 hours; and

    (ii) report additional fuel use, additional hours of operation, and energy produced by that additional use and operation to the relevant local air quality management district, the Energy Commission, and the Air Resources Board within 30 days of this Order.

11. Any permit, regulation or law prohibiting, restricting or penalizing the use of stationary or portable generators or auxiliary ship engines or other conduct allowed by this Order during the Extreme Heat Event is suspended.

12. The provisions in Paragraphs 2-9 of this Order shall expire at 11:59 p.m. on June 19, 2021, with the exception that, as provided in Paragraph 5, ships that are berthed at California ports between June 16, 2021 and June 19, 2021 shall not be required to use shore power until after 11:59 pm on June 22, 2021.

I FURTHER DIRECT that as soon as hereafter possible, this proclamation be filed in the Office of the Secretary of State and that widespread publicity and notice be given of this proclamation.

IN WITNESS WHEREOF I have hereunto set my hand and caused the Great Seal of the State of California to be affixed this 17th day of June 2021.

GAVIN NEWSOM
Governor of California

ATTEST:

SHIRLEY WEBER
Secretary of State

2740 West Nielsen Avenue Office/Warehouse Project (Development Permit Application No. P21-02699 and Tentative Parcel Map No. P21-05930)

Summary

SCH Number	2022050265
Lead Agency	City of Fresno
Document Title	2740 West Nielsen Avenue Office/Warehouse Project (Development Permit Application No. P21-02699 and Tentative Parcel Map No. P21-05930)
Document Type	EIR - Draft EIR
Received	2/24/2023
Present Land Use	IH (Heavy Industrial) / Heavy Industrial
Document Description	The proposed project would result in the construction of four office/warehouse buildings that would be configured for heavy industrial uses by tenants that have not been identified. The proposed buildings would result in a total gross floor area of approximately 901,438 square feet. The buildings' exterior would be up to 44 feet high with an interior height of up to 36 feet and designed with a total of 201 loading dock doors on the north and south sides of the buildings. The four buildings would be comprised of the following: Building 1 would be 468,812 square feet and would provide 122 loading dock doors; Building 2 would be 248,786 square feet and would provide 46 loading dock doors; Building 3 would be 93,074 square feet and would provide 18 loading dock doors; and Building 4 would be 90,766 square feet and would provide 15 loading dock doors. A total of 594 on-site parking spaces would be provided for vehicles and trucks.

Project No. CFO1802

March 2020

This page intentionally left blank

EXECUTIVE SUMMARY

The City of Fresno (City) is committed to providing a livable, equitable, and economically vibrant community through the reduction of greenhouse gas (GHG) emissions. By using energy more efficiently, harnessing renewable energy to power buildings, recycling waste, and enhancing access to sustainable transportation modes, the City will keep dollars in the local economy, create jobs, and improve the community's quality of life. To that end, the City has implemented a number of sustainability and conservation efforts and seeks to continue those efforts through local planning and partnerships. This GHG Reduction Plan Update (GHG Plan Update) integrates the City's past and current efforts with its future efforts to grow and thrive sustainably.

The City adopted its first GHG Reduction Plan (GHG Plan) in December 2014.[1] The GHG Plan established a target of reducing per capita GHG emissions in the city by 21.7 percent below 2020 business-as-usual (BAU) levels by 2020 and includes GHG reduction measures designed to achieve the reduction target. The GHG Plan is considered a "Qualified Plan," according to California Environmental Quality Act (CEQA) Guidelines §15183.5.[2] Since adoption of the GHG Plan, two significant regulations/decisions have been established. First, on September 28, 2016, Governor Brown signed Senate Bill (SB) 32 into law that sets a Statewide goal of reducing GHG emissions to 40 percent below 1990 levels by 2030. Additionally, on November 30, 2015, the California Supreme Court published its decision on the Newhall Ranch Specific Plan invalidating the Environmental Impact Report (EIR) for a variety of reasons, including the use of 29 percent below business-as-usual (BAU) as a threshold to determine significance of GHG emissions under CEQA without any supporting evidence. The GHG Plan Update ensures conformity with the mandates of California Supreme Court in the Newhall Ranch case and the State of California's latest GHG regulations. The GHG Plan Update re-evaluates the City's GHG reduction targets and existing reduction strategies from the 2014 GHG Plan. New goals and supporting measures are proposed to reflect and ensure compliance with changes in the local and State policies and regulations such as SB 32 and California's 2017 Climate Change Scoping Plan. The City's GHG inventory, based on the most recent data available for the year 2016 is evaluated and the future growth in emissions for the BAU and adjusted BAU (ABAU) scenarios (the ABAU scenario takes into account the State policies) for the years 2020, 2030, and 2035 are projected. The 2020 and 2030 forecast years are consistent with the goals identified in Assembly Bill (AB) 32 and SB 32, which identify Statewide GHG reduction targets by 2020 and 2030. The 2035 forecast year correspond to the City's General Plan horizon year and will allow the City to develop long-term strategies to continue GHG reductions.

1 FirstCarbon Solutions. 2014. Fresno General Plan Update, Greenhouse Gas Reduction Plan, prepared for the City of Fresno. July. Website: https://www.fresno.gov/darm/wp-content/uploads/sites/10/2016/11/F-2-Greenhouse-Gas-Reduction-Plan.pdf (accessed December 2019).

2 CEQA Guidelines 15183.5 describes requirements of a GHG Reduction Plan that would mitigate cumulative levels of GHG emissions within a jurisdiction to a less-than-significant level and allows development project tiering from the GHG Reduction Plan.

The City's total GHG emissions in 2016 were 2,923,633 metric tons of carbon dioxide equivalent (MT CO_2e) (Table ES-A). Under the BAU scenario, in the absence of regulations and other measures to reduce GHG emissions, the City's BAU emissions in 2020 are estimated to be 3,092,486 MT CO_2e, or a 5.8 percent increase from 2016 emissions. By 2030, emissions are estimated to increase 19.7 percent from the 2016 level to 3,500,204 MT CO_2e. By 2035, emissions are estimated to increase 26.5 percent from the 2016 level to 3,697,738 MT CO_2e.

Table ES-A: City of Fresno 2016 Inventory Update and Business-as-Usual (BAU) Projections

Sector	2016 (MT CO_2e)	Percent of Total	2020 (MT CO_2e)	Percent of Total	2030 (MT CO_2e)	Percent of Total	2035 (MT CO_2e)	Percent of Total
Transportation	1,520,052	52	1,594,888	52	1,798,498	51	1,909,852	52

Notes:
- Residential Energy Includes emissions from both electricity and natural gas.
- Commercial Energy includes emissions from both electricity and natural gas.
- Industrial Energy includes emissions associated with electricity.
- Agriculture Energy includes emissions associated with electricity.MT CO_2e = metric tons of carbon dioxide equivalent

Under the ABAU forecast (which represents State efforts in reducing GHG emissions within the city), emissions will be 2,132,326 MT CO_2e in 2020; 1,939,325 MT CO_2e in 2030; and 1,801,137 MT CO_2e in 2035 (Table ES-B).

Table ES-B: City of Fresno Adjusted Business-as-Usual (ABAU) Emissions

Sector	2016	2020	2030	2035
Transportation	1,520,052	1,170,329	1,131,034	1,072,955
Commercial Energy	524,838	355,121	290,950	255,226
Residential Energy	479,371	324,760	190,210	124,904
Fugitive Emissions	270,130	144,287	167,658	178,504
Solid Waste	119,167	127,303	147,923	157,493
Industrial Energy	10,055	10,506	11,528	12,035
Agriculture	20	20	20	20
Total	**2,923,633**	**2,132,326**	**1,939,325**	**1,801,137**

This GHG Plan Update assesses the previous GHG reduction targets identified in the 2014 GHG Plan and proposes new targets that are consistent with State policies. In order to bring the City of Fresno GHG Plan in-line with the State's GHG reduction goals, emission reduction targets have been

identified as shown in Table ES-C and Figure ES-1. Based on the City's ABAU Inventory, the City would meet the reduction target in 2020. In 2030 and 2035, the City would need to reduce emissions by 29,316 MT CO_2e and 209,463 MT CO_2e below the ABAU scenario, respectively, to meet the State-aligned target.

Table ES-C: State-Aligned GHG Emission Reduction Targets By Year

Sector	2010 [1]	2016	2020	2030	2035
BAU Emissions (MT CO_2e)	3,745,115	2,923,633	3,092,486	3,500,204	3,697,738
Adjusted BAU Emissions (MT CO_2e)	3,745,115	2,923,633	2,132,326	1,939,325	1,801,137
State-Aligned Target (Percent change from 1990)	—	—	0	-40	-50
State-Aligned Target (Percent change from 2010)	—	—	-15	-49	-58
State-Aligned Emissions Goal (MT CO_2e)	—	—	3,183,348	1,910,009	1,591,674
Reductions from Adjusted BAU needed to meet the State-Aligned Target (MT CO_2e)	—	—	Target Met	29,316	209,463

BAU = Business-as-Usual
GHG = greenhouse gas
MT CO_2e = metric tons carbon dioxide equivalent

Figure ES-1: City of Fresno GHG Emissions Inventory, Forecast, and Targets

This GHG Plan Update provides a description of General Plan policies that support a reduction in GHGs from all sources within the City's ability to control or influence. These strategies enhance the effectiveness of State strategies by ensuring that the city is developed in ways that minimize emissions. In order to reach the long-term reduction targets, the City would also need to implement local reduction measures. These measures encourage Vehicle Miles Travel (VMT) reductions through mixed use and infill development, transportation demand management, development and penetration of electric vehicles (EVs), energy efficiency enhancement, water conservation, and

increased waste diversion. Public education and outreach would play a crucial role in educating stakeholders about the importance of implementing these measures.

Analysis of GHG emissions and potential climate change impacts for new development is required under CEQA. The GHG Plan Update provides strategies and guidelines for the reduction of GHG emissions in accordance with CEQA Guidelines Section 15183.5. A GHG Reduction Plan Consistency Checklist (Checklist) is presented to provide a streamlined review process for proposed new development projects that are subject to discretionary review and trigger environmental review pursuant to CEQA.

Finally, the GHG Plan Update in itself is not enough to meet the reduction goals without a commitment to implementation and recurring monitoring. The GHG Plan Update identifies the process for implementing and monitoring the GHG reduction strategies. Through successful implementation of this GHG Plan Update, the City will demonstrate the potential economic, social, and environmental benefits of reducing GHG emissions and providing environmental stewardship within the community.

1.0 INTRODUCTION

1.1 PURPOSE

The City of Fresno (City) prepared its first Greenhouse Gas Reduction Plan (GHG Plan) in 2014 as a part of its General Plan and Master Environmental Impact Report (MEIR), which provided a clear mandate for actions on reducing GHG emissions with GHG specific policies and an implementation measure for the City to prepare a GHG Plan. The GHG Plan set a target to reduce GHG emissions by 21.7 percent below 2020 business-as-usual (BAU) levels of emissions by 2020 and included a suite of reduction measures designed to achieve the reduction target. In addition, the GHG Plan also suggested a monitoring program designed to monitor progress by annually documenting the 19 key indicators and citywide vehicle miles traveled (VMT) every 3 years. The GHG Plan discussed "interim" targets for years 2035 and 2050, pursuant to Executive Order S-03-05[3] and the Fresno Green Sustainability Strategy[4]. The GHG Plan included projections to show the amount of emission reductions needed to achieve State-aligned targets, but the GHG Plan did not include comprehensive strategies to meet the targets beyond 2020, because of the pending adoption of Statewide regulations for later years. The GHG Plan was considered a "Qualified Plan," using the criteria found in California Environmental Quality Act (CEQA) Guidelines §15183.5.

Since the adoption of the GHG Plan in December 2014, several events within the California legislature and a decision of the California Supreme Court that affects the GHG Plan have occurred. These events include the California Supreme Court's published decision on the Newhall Ranch Specific Plan, Governor Brown signing into law Senate Bill (SB) 32, and the California adoption of the 2017 Climate Change Scoping Plan.

On November 30, 2015, the California Supreme Court published its decision on the Newhall Ranch Specific Plan invalidating the Environmental Impact Report (EIR) for a variety of reasons, including the use of 29 percent below BAU as a threshold level of significance for GHG emissions. In this case, the Court found that the EIR did not contain any evidence supporting the threshold. On September 28, 2016, Governor Brown signed SB 32 into law. SB 32 sets a Statewide goal of reducing GHG emissions 40 percent below 1990 levels by 2030. The California Air Resources Board (CARB) was directed to develop a climate change scoping plan update that would provide the regulations and policies to achieve the 2030 reduction target. On December 14, 2017, the CARB finalized "California's 2017 Climate Change Scoping Plan," providing quantitative summaries of the regulations needed to achieve the 2030 reduction target.

This GHG Reduction Plan Update (GHG Plan Update) re-evaluates the City's existing GHG reduction targets and strategies, provides new goals and supporting measures to reflect and ensure compliance with changes in local and State policies, and strives to encourage economic growth to

[3] Executive Order S-3-05 laid out GHG reduction targets for State of California: by 2010 reduce GHG emissions to 2000 levels, by 2020 reduce GHG emissions to 1990 levels and by 2050 reduce emissions to 80 percent below 1990 levels.

[4] The Fresno Green Sustainability Strategy included a commitment to meet the 2020 AB 32 goal and to meet a reduction target of 80 percent below 1990 levels by 2050.

keep the city economically competitive while achieving GHG reductions and maintaining the "CEQA Qualified Plan" status.

1.2 RELATIONSHIP TO THE GENERAL PLAN

The City of Fresno General Plan and the MEIR were adopted in 2014. The General Plan provides a clear mandate for action on GHG emissions with GHG policies and an implementation measure for the City to prepare a Climate Action Plan as part of the General Plan and MEIR. The City developed the GHG Plan, which was concurrently approved with the General Plan and included as an appendix to the MEIR. The intent of the GHG Plan was to achieve compliance with State mandates by focusing on feasible actions the City can take to minimize the adverse impacts of growth and development on climate change and air quality. Since the General Plan was adopted and the MEIR was certified in 2014, some new local, State, and/or federal regulations have been enacted. In order to bring the General Plan into technical conformance with current local and State law, the City is also updating and converting the existing General Plan MEIR to a Program EIR (PEIR) with the goal of extending the life of the Fresno General Plan and the accompanying environmental document by up to 10 years. This update is intended to streamline implementation of the General Plan's programs and policies by supporting them with updated environmental analysis, a current regulatory framework, and mitigation measures, pursuant to CEQA. As part of the General Plan MEIR Update, the City's existing GHG Plan is also being updated to comply with current State regulations including SB 32, which has a Statewide goal of reducing emissions 40 percent below 1990 levels by 2030. This GHG Plan Update also reflects the changes in local policies to ensure these changes are accounted for and included in the City's GHG reduction measures and strategy.

1.3 ORGANIZATION AND PLAN CONTENT

The GHG Plan Update includes the following sections:

- A **Background** section that describes the environmental and regulatory setting for GHGs;
- An **Emission Inventory and Forecasts** section that accounts for the sources of emissions and forecasts to year 2020, 2030, and 2035;
- A **Statewide Reduction Strategy** section that summarizes the reductions from State regulations as outlined in the 2017 Climate Change Scoping Plan, and the reduced 2020, 2030, and 2035 emission forecasts that take into account State and local GHG reduction strategies;
- A **Local Reduction Strategy** section that includes the updates and refinements to the GHG reduction strategies from the 2014 GHG Plan, and new measures to meet the 2020, 2030, and 2035 reduction targets;
- A **Development Project Requirements** section that outlines the development review process used to ensure that future proposed development projects are consistent with the GHG Plan Update. A GHG Reduction Plan Update Consistency checklist to determine future project consistency with GHG Reduction Plan Update; and

- An **Implementation and Monitoring** section that outlines the steps and recommendations for effective implementation and monitoring of the GHG Reduction Plan Update.

1.4 BUILDING ON PRIOR ACTIONS

1.4.1 Fresno Green 2007 Sustainability Strategy

The City of Fresno has taken several important steps to improve the City's sustainability and reduce impacts that include GHG emissions. The Sustainability Strategy includes five Green Visions:

- **New City Beautiful:** Fresno will be nationally recognized for the innovative integration of buildings within their neighborhood context; good urban design; and giving priority to public health, open spaces, public art, historic preservation, urban forests, and the protection of natural habitats.

- **Sierra View 2025:** The Sierra Nevada mountain range will be clearly visible to all Valley residents by 2025. Public health will be improved by having cleaner air, enhanced public transportation, and additional opportunities for walking and cycling.

- **Solar Valley:** Fresno will become a leader in renewable energy use by maximizing new renewable sources as well as increasing the efficiency of its existing uses. Fresno will lead the State in the creation of related innovative technology and new business enterprises. With its abundant sunshine and population growth, the opportunity exists to improve air quality, reduce dependence on foreign energy, and provide attractive new jobs by harnessing solar and other types of renewable energy.

- **Green Enterprises and Economic Development:** The City of Fresno will become a center for innovative business enterprises that focus on the "triple bottom line" of providing environmental, economic, and social benefits.

- **City as Good Steward:** The City of Fresno will lead by example by greening up its facilities and practices, embracing a zero waste initiative, providing appropriate staff resources, and collaborating with other municipalities and agencies to develop regionally based Green programs.

1.4.2 Zero Waste Strategic Action Plan

The City of Fresno Zero Waste Strategic Action Plan, approved February 11, 2008, aims to achieve 75 percent diversion by 2012 and zero waste status by 2025.[5] Zero Waste is a philosophy and a design principle for the 21st Century that includes recycling but goes beyond recycling by taking a "whole system" approach to the vast flow of resources throughout society. It is a goal and guide for people to emulate sustainable natural cycles, where all discarded materials are resources for others to use.

[5] Fresno, City of. 2008. *City of Fresno – Zero Waste Strategic Action Plan*. Available online at: swalco.org/DocumentCenter/View/955/Zero-Waste-and-Sustainability---Fresno-CA---Zero-Waste-PDF?bidId= (accessed October 23, 2019).

1.4.3 City of Fresno Urban Water Management Plan

The Water Conservation Act of 2009 (SBX7-7) was enacted in November 2009. SBX7-7 requires urban retail water suppliers, such as the City of Fresno, to develop per capita water use targets to be met by 2015 and 2020. The overall statewide objective of SBX7-7 is to reduce per capita water use by 20 percent by the year 2020. The 2010 Urban Water Management Plan (UWMP) was adopted by the Fresno City Council on November 29, 2012 to meet this requirement. The UWMP contains water conservation best management practices (BMP) to achieve the required reductions in water use. The 2010 UWMP was updated in 2015[6] and describes the City's water demands and supplies, reliability and water conservation strategies. The 2015 UWMP includes data covering the years from 2011 to 2015 and was adopted by the City Council on June 23, 2016.

1.4.4 Water Efficient Landscape Standards

The City has adopted water conserving landscape requirements that are specified in the City Municipal Code (Section 6-522. Water Efficient Landscape Standards). These requirements define standards and procedures for the design, installation, and management of landscapes in order to utilize available plant, water, land, and human resources to the greatest benefit of the people of the city.

1.4.5 Sustainable Groundwater Management Act

In September 2014, Governor Brown signed legislation requiring that California's critical groundwater resources be sustainably managed by local agencies. The Sustainable Groundwater Management Act (SGMA) provides a framework for the sustainable management of groundwater supplies by local agencies, with a role for State intervention when necessary to protect the resource. The SGMA requires that Groundwater Sustainability Plans (GSPs) be developed for medium- and high-priority groundwater basins identified within the Department of Water Resources (DWR) Bulletin 118 report. Fresno county overlies five groundwater subbasins; Kings, Madera, Delta-Mendota, Westside, and Pleasant Valley. With the exception of Pleasant Valley, the four other basins are currently designated by DWR as high priority and subject to a condition of critical overdraft. The SGMA does not apply outside of mapped groundwater basins. The SGMA defines a process and timeline for local agencies to achieve the goal of sustainable management of groundwater basins. It also provides tools and authorities to take the necessary steps to achieve that goal. For local agencies involved in implementation, the requirements are significant and can be expected to take years to accomplish. As a first step, in March 2015, the Fresno County Board of Supervisors formed a workgroup to advise the Board of Supervisors regarding items relating to the SGMA.

1.4.6 Recharge Fresno

Recharge Fresno is the City's program to improve the pipelines and water system facilities that will capture, treat, and deliver water to Fresno homes and businesses, including surface water from the Sierra Nevada Mountains. This program has the following objectives: ensure a reliable and sustainable water supply for Fresno's present and future prosperity by increasing the available

[6] Fresno, City of. 2016. *2015 Urban Water Management Plan*. Available online at: www.fresno.gov/publicutilities/wp-content/uploads/sites/16/2016/11/CityofFresno2015UWMP_adopted.pdf (accessed October 23, 2019).

water supply; bring new, treated surface water from the Sierra Nevada Mountains to our community; improve natural and intentional groundwater recharge; maintain focus on conservation and its role in ensuring a sustainable water supply for Fresno; and ensure a safe and reliable water supply.

1.4.7 General Plan Air Quality Update 2009

The Air Quality Update satisfied the requirements of AB 170 that mandated cities and counties of the San Joaquin Valley to address air quality in their General Plans. Many of the goals, policies, and implementation measures that reduce air pollutant emissions also reduce GHGs. In addition, the Air Quality Update included GHG specific policies that are carried forward into the General Plan and formed the basis of the strategy defined in the existing GHG Plan. The GHG Plan Update is built upon the strategies identified in the existing GHG Plan.

1.4.8 Fresno General Plan

The Fresno General Plan was adopted in 2014 and includes the Resource Conservation Element that has objective RC-5, which requires the City to take the necessary and cost-effective actions to achieve and maintain reductions in GHG emissions. The General Plan specifies implementing policies (RC-5-a to RC-5-g) to achieve this objective. The policy RC-5-a requires the City to "Support State Goal to Reduce Statewide GHG Emissions" and RC-5-b requires developing a "GHG Plan" that should be periodically updated to reflect the State GHG regulations. Policy RC-5-b provides the following outlines to achieve objective RC-5:

- A baseline inventory of all known or reasonably discoverable sources of greenhouse gases (GHGs) that currently exist in the city and sources that existed in 1990 (Updated to 2010).
- A projected inventory of the GHGs that can reasonably be expected to be emitted in the city in the year 2035 in accordance with discretionary land use decisions pursuant to this General Plan and foreseeable communitywide and municipal operations.
- A target for the reduction of emissions from those identified sources.
- A list of feasible GHG reduction measures whose purpose shall be to meet the established local reduction target, including energy conservation and "green building" requirements in municipal buildings and private development.
- Periodically update municipal and community-wide GHG emissions inventories to determine the efficacy of adopted measures and to guide future policy formulation needed to achieve and maintain GHG emissions reduction targets.

1.5 CEQA TIERING AND STREAMLINING ANALYSIS OF GREENHOUSE GAS EMISSIONS

New development that would occur with the buildout of the General Plan must address GHG impacts to comply with CEQA. The California legislature has adopted tiering and streamlining provisions in SB 97 that encourage cities to adopt GHG reduction plans as a mechanism to assist with project CEQA

compliance. According to the CEQA Guidelines Section 15183.5,[7] GHG reduction plans and CAPs must meet the following criteria in order to use CEQA tiering and streamlining provisions:

A. Quantify GHG emissions, both existing and projected over a specified time period, resulting from activities within a defined geographic area;

B. Establish a level, based on substantial evidence, below which the contribution to GHG emissions from activities covered by the plan would not be cumulatively considerable;

C. Identify and analyze the GHG emissions resulting from specific actions or categories of actions anticipated within the geographic area;

D. Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level;

E. Establish a mechanism to monitor the plan's progress toward achieving the level and to require amendment if the plan is not achieving specified levels;

F. Be adopted in a public process following environmental review.

This GHG Plan Update is structured to meet the streamlining criteria listed above. Project compliance with the applicable General Plan policies and strategies identified in the Checklist would result in less-than-significant impacts related to GHG emissions.

1.6 HOW DOES THE PLAN REDUCE GREENHOUSE GAS EMISSIONS?

The largest source of GHGs is the combustion of carbon containing fuels resulting in carbon dioxide (CO_2). Although there are many other GHGs, the GHG Plan Update emphasizes actions under the City's control or influence that can reduce CO_2 emissions. Other GHGs such as methane (CH_4), nitric oxide (N_2O) and refrigerants such as hydrofluorocarbons (HFCs) are addressed in the plan, but have fewer sources and fewer control opportunities at the City level.

Strategies to reduce Citywide GHG emissions include:

- Improve the efficiency of the vehicles so they can achieve the same amount of work using less fuel (e.g., improve aerodynamics in cars and trucks/low friction oils).
- Move to low carbon power generation with zero or low GHG facilities such as solar, wind, biofuels.
- Improve the efficiency of the combustion process in the City-owned facilities to obtain more energy from the fuel being burned (e.g., high-efficiency burners, better fuels).

[7] CEQA Guidelines 15183.5 describes requirements of a GHG Reduction Plan that would mitigate cumulative levels of GHG emissions within a jurisdiction to a less-than-significant level and allows development project tiering from the GHG Reduction Plan.

- Conservation programs to reduce water use (reduced energy for water pumping and transport).
- Sequestration in urban forests (storing greenhouse gases).
- Reduce municipal waste to reduce emissions from transport and decomposition (e.g. recycling, reuse, diversion).

The GHG Plan Update provides a comprehensive approach utilizing different GHG reduction strategies to achieve emission reductions sufficient to demonstrate consistency with State of California targets. The GHG Plan Update builds on the General Plan policies and implementation measures. Where needed, the GHG Plan Update provides more details to clarify and focus action and to streamline implementation.

1.7 RELATIONSHIP TO STATE AND FEDERAL ACTIONS TO REDUCE GREENHOUSE GAS EMISSIONS

Efforts by cities to reduce GHGs are an important part of larger effort implemented by the State of California and to a lesser degree the federal government. Limited action has taken place on the federal level to reduce GHG emissions, making State of California actions the most important to the City. California has implemented ambitious control strategies to reduce GHG emissions. The State recognizes the magnitude of the challenge of reducing GHGs to the extent needed to prevent catastrophic effects of climate change is such that reductions throughout the state, including those at the local level, are required. Climate change is a global problem that will take unprecedented cooperation and action at international, national, state, and local levels. California has chosen to be a leader in this effort and a model for others to follow.

1.8 COMMUNITY REDUCTION TARGETS

Future development anticipated by the City of Fresno creates challenges and opportunities for reducing GHG emissions sufficiently to ensure that growth will not hinder or obstruct the implementation of State GHG regulations including AB 32 and SB 32. Cities with relatively high rates of growth, such as Fresno will produce a larger share of GHG emissions in the future compared with slow-growing and built-out parts of the State. However, new development presents opportunities, with its ability to incorporate the latest technologies into buildings to reduce energy use and its ability to build complete neighborhoods and commercial areas in ways that reduce vehicle travel. The policy mechanisms such as SB 743 further support environmentally beneficial development by allowing CEQA to facilitate the implementation of transit-oriented infill development.

1.8.1 2020 Reduction Target

AB 32 requires CARB to reduce Statewide GHG emissions to 1990 levels by 2020. As part of this legislation, CARB was required to prepare a “Scoping Plan” that demonstrates how the State will achieve this goal. The Scoping Plan was first adopted in 2011 and in it local governments were described as “essential partners” in meeting the Statewide goal, recommending a GHG reduction level of 15 percent below 2005 to 2008 level, depending on when a full emissions inventory is available, by 2020.

Reductions will be achieved by existing development and new projects. Residents of new development projects will achieve lower per capita rates than residents of existing development. This is because of greater energy efficiency in new structures and lower motor vehicle travel resulting from the project designs and higher development densities anticipated from General Plan implementation.

1.8.2 Targets After 2020

The CARB released the First Update to the Climate Change Scoping Plan on February 10, 2014 (CARB 2014). The draft update emphasized the need for a mid-term target between 2020 and 2050 to provide a continuum of action to reduce cumulative emissions. The EO B-30-15 and SB 32 required CARB to reduce Statewide GHG emissions to 40 percent below 1990 levels by 2030. The EO B-30-15 further stated that the emission reduction target of 40 percent below 1990 levels by 2030 is an interim-year goal to make it possible to reach the ultimate goal of reducing emissions 80 percent under 1990 levels by 2050. The order directs CARB to provide a plan with specific regulations to reduce Statewide sources of GHG emissions. The Executive Order does not include a specific guideline for local governments. The 2017 Scoping Plan recommends local plan level GHG emissions reduction goals (CARB 2017).

At the growth rates projected for General Plan buildout, the city could continue to grow through 2050 without designating additional land for development. The General Plan and the GHG Plan Update ensure that the City of Fresno will do its part of reducing GHG emissions for the short-term (2020) and the long term (2050).

1.9 CHALLENGES AND OPPORTUNITIES

The effects of GHG emissions are cumulative. Global warming is the result of emissions from every source on the globe that combine to increase GHG concentrations in the atmosphere. Scientific evidence supports the need for drastic worldwide reductions to prevent catastrophic climate change. According to the Intergovernmental Panel on Climate Change (IPCC) to limit the global warming to 1.5 degree Celsius above pre-historic levels the world would have to curb its carbon emissions by at least 49 percent of 2017 levels by 2030 and then achieve carbon neutrality by 2050 (Nature 2018). This leads to the following questions:

- What is California's responsibility for reducing emissions?
- What is local government's responsibility for reducing emissions?
- What is an individual development project's responsibility for reducing emissions?
- What is each person's responsibility for reducing emissions?

The government structure in the United States with its checks and balances limits the power of the states to take action to reduce GHGs. For example, states are not allowed to interfere with interstate and international commerce; however, powers that are not vested in the federal government are reserved for the states. Individual rights for people to live how and where they want are also highly prized. This structure creates challenges for reducing GHG emissions that touch every sector of the economy and that are greatly influenced by individual choices and actions. With uneven action among the states and nations, the potential exists for regulations to cause businesses simply to relocate their emissions to nations, states, or cities with weak or no regulations. Fortunately, many

actions that reduce GHG emissions produce multiple benefits that offset the cost of implementation. However, it must be recognized that individuals or organizations implementing the action may not directly benefit from cost savings or may have difficulty with initial capital costs.

A thorough discussion of regulatory authority for GHG emissions is provided in Section 2. In short, the State has broad authority to regulate GHG emission sources. It has authority to regulate GHGs from motor and transit vehicles, power generation, and industrial processes, and sets efficiency standards for buildings, lighting, appliances, water use, and waste management/recycling. On the other hand, local government's role is mostly a supportive one. Local government is called upon to support state programs and to use its land use authority and police power to reduce GHG impacts. For example, local government is authorized by the State to adopt ordinances that exceed energy standards for buildings and exceed water conservation and recycling mandates. Through the development review process and CEQA, local government can require or encourage project designs that produce fewer vehicle trips and miles traveled and include mitigation measures with which projects must comply as conditions of approval.

Individual choice plays an important role in reducing GHG emissions. The State can mandate increasing numbers of EVs to be sold in California to meet emission standards, but it cannot force people to buy them. It can mandate energy efficient appliances and buildings but cannot make people turn out the lights and turn down the thermostat to save energy. It cannot prevent people from buying more and bigger televisions. However, the State and the City can provide incentives and disincentives that affect choice to align with the goal of reducing GHG emissions.

2.0 BACKGROUND INFORMATION

GHG emissions and climate change are complex issues that are the topics of hundreds of books, research papers, and policy documents. This section of the GHG Plan Update provides a brief overview of climate change and the local factors that affect the GHG emission inventory. The following information provides a discussion in a city of Fresno context.

2.1 CITY OF FRESNO BACKGROUND

The GHG Plan Update uses population, employment, and housing statistics as the basis for estimating current and future year emissions and reduction targets.

2.1.1 Location and Constraints to Growth

The city of Fresno is located in Fresno county, which is generally located in the center of the San Joaquin Valley, the most productive agricultural region in the nation and the world. Fresno's central location in California between San Francisco (184 miles) to the north and Los Angeles (222 miles) to the southwest has made it an important regional center.

There are no significant physical barriers to Fresno's future growth; however, political boundaries and policy considerations are very important in shaping future growth. The San Joaquin River and the Fresno/Madera County line run along the northern edge of the city. The city of Clovis abuts Fresno to the northeast and east, preventing growth in that direction. The land southeast, south and west are mostly prime farmland. The southeast area is a long-term growth area in the General Plan. No expansion of the sphere of influence is planned in the General Plan.

2.1.2 Transportation Facilities

The city of Fresno is crossed by two important State highways used for regional travel and commerce. State Route 99 (SR-99) runs northwest/southeast through the city, connecting Fresno to northern and southern California. State Route 41 (SR-41) connects Fresno to the Central Coast and is a main route to Yosemite National Park. SR-41 also acts as a primary commuter facility between northern and southern parts of Fresno. State Route 168 (SR-168) runs north/east to Clovis acting as a commute facility and beyond to the Sierra Nevada. SR-168 intersects with State Route 180 (SR-180), which runs east/west through the city, connecting Fresno with the communities of western Fresno county and with Kings Canyon and Sequoia National Parks.

Fresno is on the California High Speed Rail route and a station is planned for downtown Fresno. High Speed Rail is anticipated to be a major catalyst for development and redevelopment in Fresno, although the General Plan is not reliant on it to achieve its stated infill, development, and redevelopment goals. Fresno currently receives rail service from Amtrak. The City of Fresno's Transportation Department, via Fresno Area Express (FAX), provides bus transit service. FAX offers

17 fixed-route bus lines and Handy Ride Paratransit Service[8] FAX operates a modern clean and green fleet of over 100 buses.

2.1.3 General Plan Footprint and Buildout Statistics

The city of Fresno has a substantial development footprint. The General Plan Planning Area is 166 square miles (106,027 acres), which includes the 162 square miles (103,570 acres) sphere of influence, and the 4 square miles (2,486 acres) North Area, located at the northern tip of the city. The sphere of influence consists of both the incorporated 113 square mile city (72,224 acres) and the 49 square mile unincorporated county (33,803 acres) land. Some of the unincorporated land is completely surrounded by the city of Fresno and is referred to as a "county island," whereas other unincorporated land lies adjacent to the outer fringe of the city.

The sphere of influence is a boundary that encompasses lands that are expected to ultimately be annexed into the city. Until annexed, the lands are unincorporated and fall under the jurisdiction of the County of Fresno.

In accordance with the requirements of the State of California, the Local Agency Formation Commission (LAFCO) authorizes a "sphere of influence" around municipalities as the probable physical boundary and ultimate service area of that government.

Table 2-A shows the acreage within the General Plan Planning Area when the General Plan was approved.

Table 2-A: General Plan Statistics

Land Use Designations	General Plan Acreage
Residential	46,043
Commercial	6,913
Industrial	9,578
Mixed use	4,223
Public facilities	17,671
Open space	3,001
Other	18,598
TOTAL	**106,027**
Projected Population at Build-out	970,000

Source: City of Fresno Planning and Development Department (2019)

Table 2-B provides additional detail in terms of land use type for existing development and development anticipated with the continued implementation of the General Plan. The General Plan envisions an increase in the amount of multi-family residential compared with single-family residential development. The City assumes buildout of the General Plan Planning Area would occur after 2056.

msf = million square feet

The growth statistics reveal two important points. First, substantial growth is projected for Fresno over the coming decades and that growth will increase GHG emissions. Second, the proposed mix of land uses that would accommodate the growth in population will increase development density.

Increased density when combined with a strong pedestrian and transit orientation can reduce motor vehicle travel and related GHG emissions.

2.2 CLIMATE CHANGE BACKGROUND

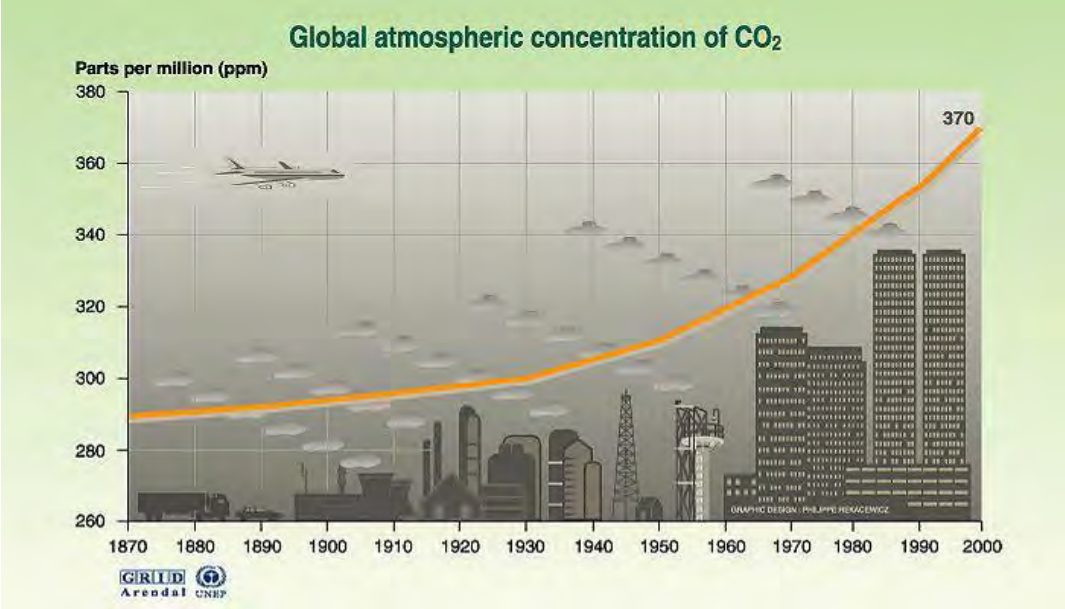
Climate scientists refer to gases that trap heat in the atmosphere as greenhouse gases. The effect is analogous to the way a greenhouse retains heat. The energy influx is maintained by three main factors: the amount of energy coming in, which depends on the earth's distance from the sun and solar activity; the albedo (the ability of the earth's surface to reflect light); and the chemical composition of the atmosphere. The presence of GHGs in the atmosphere regulates the earth's temperature.

The chemical composition of the atmosphere changes over time. Natural processes and human activities emit GHGs. As shown in Figure 2-1, carbon dioxide concentrations in the atmosphere have increased over time. The global atmospheric concentration of carbon dioxide (CO_2) data in Figure 2-1 prior to 1958 is from ice core measurements and post-1958 data are from the Mauna Loa, Hawaii site (NOAA 2019).

2.2.1 Global Warming Potential

GHGs have varying global warming potential and atmospheric lifetimes. Carbon dioxide, the reference gas for global warming potential, has a global warming potential of 1. The calculation of the carbon dioxide equivalent (CO_2e) is a consistent methodology for comparing emissions, since it normalizes various emissions to a consistent metric. Methane's warming potential of 21 indicates that methane has a 21 times greater warming effect than carbon dioxide on a molecule per

Figure 2-1: Global Atmospheric Concentration of CO_2



molecule basis. A carbon dioxide equivalent is the mass emissions of an individual GHG multiplied by its global warming potential. Emissions are typically shown in MT CO_2e or a million times that, million metric tons of carbon dioxide equivalents (MMT CO_2e). Global warming potentials are shown in Table 2-C.

Table 2-C: Global Warming Potentials

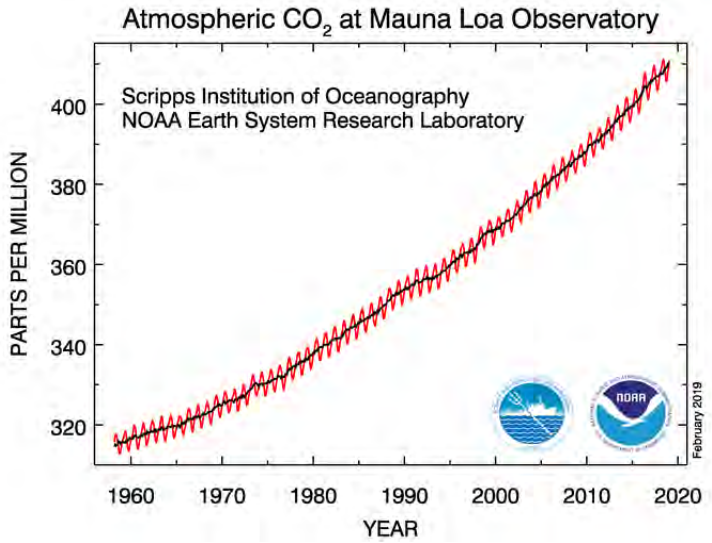
Greenhouse Gas	Global Warming Potential
Carbon dioxide (CO_2)	1
Methane (CH_4)	21
Nitrous oxide (N_2O)	310

Source: Intergovernmental Panel on Climate Change (2007).

2.2.2 Global Climate Change Trends

Figure 2-2 provides a more detailed look of concentrations since 1960 showing continuing steady increases even with international actions that have been taken to date. The National Oceanic and Atmospheric Administration reported that the global average CO_2 concentration was 410 parts per million (ppm) in 2019 (NOAA 2019).

Figure 2-2: Carbon Dioxide Concentrations 1960 to 2019



Source: NOAA 2019: Trends in Atmospheric Carbon Dioxide. Full Mauna Loa CO_2 Record.

2.2.3 Greenhouse Gas Emission Inventories

Emission inventories are databases that list by source and pollutant the amount of air pollutants discharged into the atmosphere during a given period of time. Inventories can range from individual businesses, cities, counties, states, nations, to global in scope. Emission inventories are used to help determine significant sources of air pollutants, establish emission trends over time, and target regulatory actions.

Emissions of GHGs are a true cumulative impact. Emissions anywhere and everywhere in the world contribute to increased concentrations of GHGs in the atmosphere and the potential for climate change. Viewing the emissions output at global, national, state, and local levels is important to understanding the scale of the problem and the relative contribution of each level of government organization.

Global carbon emissions from fossil fuels have increased rapidly since 1900 and continue to increase at an even faster pace since the year 2000 (EPA 2018). Figure 2-3 shows this trend with particularly dramatic increases after World War II and more recently with rapid increases in China and other rapidly industrializing nations in the last decade. Emissions have increased over 600 percent since 1950. The increases in emissions are consistent with the atmospheric concentrations shown in Figure 2-2 and Figure 2-3.

GHG 2017 inventory for all sources in the United States and California is shown in Table 2-D. The percentage of emissions for the United States is 12.2 percent of the global total yet accounts for only 4.4 percent of the world's population. This places extra responsibility for the United States to take a leadership role and to act as a model for other nations to follow. Although previous international efforts have not made substantial progress in slowing the growth in GHG emissions,

Figure 2-3: Increases in Global Carbon Dioxide Emissions from Fossil Fuels 1900 to 2014

Source: EPA (2018).

Table 2-D: United States, California, and World GHG Emission Inventory (CO_2e)

Inventory	MMT CO_2e	Percent of Total
California (2017)	424.1	0.8
United States (2017)	6,457	13.09
World (2016)	49,300	100

Sources: CARB 2019, EPA 2018, and PBL 2017.
CO_2e = carbon dioxide equivalent
GHG = greenhouse gas
MMT = million metric tons

the United States has many reasons to change to lower carbon economy. For example, reducing energy imports and increased energy security, cost savings from efficiency, employment in renewable energy.

2.3 EFFECTS OF CLIMATE CHANGE ON FRESNO

Scientific research indicates that an increase in global average temperature of 2 degrees Centigrade (°C) (3.6 degrees Fahrenheit [°F]) above pre-industrial levels poses risks to natural systems and human health and well-being. This is only 1.1°C (2.0°F) above present levels. In order to avoid temperatures above those levels, studies indicate that a concentration at or below 450 ppm CO_2e must be achieved. Other studies indicate a stable concentration of about 400 ppm CO_2e will be needed to prevent the 2.0°C (3.6°F) increase. As shown in Figure 2-2 above, readings at the Mauna Loa monitoring station have already exceeded 410 ppm CO_2e and the international average is likely to exceed 400 ppm in a few years. The existing trend is likely to cause substantial harm to future generations and nature (CARB 2014).

Despite efforts to reduce GHG emissions, these gases can remain in the atmosphere for hundreds of years and emissions are expected to continue to increase globally for some time. Therefore, it is probable that climate change impacts will be observed. The impacts are predicted to vary by region. In California, climate change may result in a decreased water supply, sea level rise, and increased wildfires, to name a few. In order to manage these impacts, the city's vulnerability to these impacts is assessed and strategies have been developed to adapt to the projected changes.

Determining potential future impacts from climate change is an evolving process. The 2009 California Climate Adaptation Strategy provides a proactive foundation for an ongoing adaptation process within California for the sectors with the greatest risks. The document provides strategies for state and local governments to adapt to climate change (CNRA 2009). By incorporating applicable strategies as Implementation Strategies, the City is taking a proactive approach to ensure that impacts to the city are minimized.

The following discussion describes the main risks from climate change that could be experienced in the city of Fresno. The General Plan sections related to safety, public utilities, hydrology, and resource conservation contain policies that would decrease the risks to residents of the city. In general, City programs and policies to respond to existing levels of risk may need to be implemented more frequently or expanded to protect city residents and resources from potential impacts from climate change. Response to more or bigger events can be expected to demand more city resources.

2.3.1 Wildfire

The city of Fresno is surrounded by irrigated agricultural lands, rural residential development, and the city of Clovis that are not subject to wildfire to any great extent. Fallow farmland and vacant land with weedy growth can become a fire hazard if not maintained. The San Joaquin River bluff area along the city's northern boundary could experience longer dry seasons and greater threats from wildfire.

2.3.2 Water

One of the potential impacts of climate change is a loss of natural snowpack, particularly the Sierra Nevada snowpack. Snowmelt provides an annual average of 15 million acre-feet of water, released between April and July each year (Department of Water Resources 2008). The California Department of Water Resources projects that the Sierra snowpack will experience at least a 25 percent reduction from its historic average by 2050 (DWR 2014). Climate change is also anticipated to bring warmer storms that result in less snowfall at lower elevations, reducing the total snowpack.

Changes in precipitation patterns are expected to cause increased flooding. For the purposes of federal flood insurance, the Federal Emergency Management Agency (FEMA) has traditionally used the 100-year flood event, which refers to the level of flood flows that has a 1 percent chance of being exceeded in any single year. As California's hydrology changes, what is currently considered a 100-year flood may strike more often, leaving many communities at greater risk. Moreover, as peak flows and precipitation change over time, climate change calls into question assumptions of "stationarity" that are used in flood-related statistical analyses such as the 100-year flood. That is, the probable area of inundation does not change from year to year.

The California Department of Water Resources (2008) recommends that local governments implement land use policies that decrease flood risk. These following recommendations are included as GHG Plan implementation policies where applicable and feasible.

San Joaquin River Bluffs

San Joaquin River

- Local land use agencies should update General Plans to address increased flood risks posed by climate change. General Plans should consider an appropriate risk tolerance and planning horizon for each locality.
- Local governments should site new development outside of undeveloped floodplains unless the floodplain has at least a sustainable, 200-year level of flood protection.
- Local governments should use low-impact development techniques to infiltrate and store runoff.
- Local governments should include flood-resistant design requirements in local building codes. State, federal, and local agencies should develop conjunctive use management plans that integrate floodplain management, groundwater banking, and surface storage. Such plans could help facilitate system reoperation and provide a framework for the development of local projects that are beneficial across regions.
- Local land use agencies should adopt ordinances that protect the natural functioning of groundwater recharge areas.

As precipitation falls in the form of rain rather than snow with greater storm intensity, high-frequency flood events are projected to increase. There is currently no known literature that suggests an increase in flooding from climate change in the Fresno area; however, it is possible that there could be changing weather patterns that would result in heavy downpours of rain in the area, which could cause street flooding. In addition, the potential for increased wildfires in foothill and mountain areas upstream from Fresno resulting from climate change could increase floods following fire if reservoirs had insufficient capacity to capture the runoff at that time.

2.4 FEDERAL, STATE, AND REGIONAL ACTIONS TO ADDRESS CLIMATE CHANGE

2.4.1 United States Environmental Protection Agency

The United States Environmental Protection Agency (EPA) is responsible for implementing federal policy to address global climate change. The federal government's early efforts have focused on public-private partnerships to reduce GHG intensity through energy efficiency, renewable energy, methane and other non-CO_2 gases, agricultural practices, and implementation of technologies to achieve GHG reductions.

The EPA is required to regulate carbon dioxide and other GHGs as pollutants under Section 202(a)(1) of the federal Clean Air Act. The first step in implementing its authority was the Mandatory Reporting Rule that required inventory data collection commencing on January 1, 2010 with first reports due March 2011. Effective January 2, 2011, the EPA requires new and existing sources of GHG emissions of 75,000 tons per year to obtain a permit under the New Source Review Prevention of Significant Deterioration and Title V Operating Permit Program.

The main federal regulatory program for automobiles is the Corporate Average Fuel Economy (CAFE) program, which has been in place since 1975. Under previous administrations, CAFE was the primary means of limiting mobile source carbon emissions. Rules finalized in 2012 put in place binding standards through Model Year 2021 and offered estimated standards through 2024. The federal light-duty vehicle standards were developed in two phases that harmonized with California standards through 2016 (Phase 1) and 2025 (Phase 2) and developed the first ever federal GHG standards for medium-duty and heavy-duty vehicles. At the time, the EPA estimated that the new standards in this rule would reduce CO_2 emissions by approximately 270 MMT and save 530 million barrels of oil over the life of vehicles sold during the 2014 through 2018 model years.

In 2018, however, the EPA proposed a new, less-stringent set of standards called the Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021–2026 Passenger Cars and Light Trucks. The SAFE Vehicles Rule would amend certain existing CAFE and tailpipe CO_2 emissions standards for passenger cars and light trucks and establish new standards, all covering model years 2021 through 2026. The standards have yet to be finalized.

In June 2013, President Obama approved the nation's first Climate Action Plan that lays out a series of executive actions to reduce carbon pollution, prepare the nation for the impacts of climate change, and lead international efforts to address global climate change. The Plan reiterated the President's 2009 pledge to reduce United States GHG emissions by 17 percent below 2005 levels by 2020. Under the President Trump administration, the nation's stance on climate change has shifted from being a part of global action to policy stagnation and deregulation. In June 2017, the U.S. decided to withdraw from the Paris Climate Agreement, which was an agreement among countries to reduce global GHG emissions resulting from the 2015 United Nations Climate Change Conference. Currently, the EPA has been engaged in research into approaches to reduce the U.S. contribution to climate change. Areas of climate research include economic analyses of regulatory policy instruments (e.g., emissions trading, estimation of GHG reduction benefits, the role of uncertainty, and modeling the economic impacts of ocean acidification). In the meantime, many U.S. States and

companies are putting in place their own commitments to reduce global climate change by enacting local climate action plans, policies, and standards.

2.4.2 State of California

California has adopted a variety of regulations aimed at reducing the State's GHG emissions. While state actions alone cannot stop climate change, the adoption and implementation of this legislation demonstrates California's leadership in addressing climate change. Key legislation and Executive Orders pertaining to the State's reduction targets are described below.

2.4.2.1 Executive Order S-3-05

California Governor Arnold Schwarzenegger announced on June 1, 2005, through Executive Order S-3-05, the following reduction targets for GHG emissions:

- By 2010, reduce GHG emissions to 2000 levels.
- By 2020, reduce GHG emissions to 1990 levels.
- By 2050, reduce GHG emissions to 80 percent below 1990 levels.

The State achieved the first goal of reducing emissions to 2000 levels by 2010. Total GHG emissions were reduced by 2.9 percent during that period even though population increased by 10.9 percent in the same period (CARB 2014). The State also appears to be on track for achieving the 2020 target.

2.4.2.2 Executive Order B-30-15

On April 29, 2015, California Governor Jerry Brown announced through EO B-30-15 the following GHG emissions target:

- By 2030, California shall reduce GHG emissions to 40 percent below 1990 levels.

The emissions reduction target of 40 percent below 1990 levels by 2030 is an interim-year goal to make it possible to reach the ultimate goal of reducing emissions 80 percent below 1990 levels by 2050. The order directs CARB to provide a plan with specific regulations to reduce Statewide sources of GHG emissions. EO B-30-15 does not include a specific guideline for local governments.

2.4.2.3 Assembly Bill 32 (AB 32) and Senate Bill 32 (SB 32), California Global Warming Solutions Act

AB 32 requires CARB to reduce Statewide GHG emissions to 1990 levels by 2020. As part of this legislation, CARB was required to prepare a "Scoping Plan" that demonstrates how the State will achieve this goal. The Scoping Plan was adopted in 2011, and in it, local governments were described as "essential partners" in meeting the Statewide goal, recommending a GHG reduction level of 15 percent below 2005 to 2008 levels (depending on when a full emissions inventory is available) by 2020.

CARB released the 2017 Scoping Plan in November 2017. The 2017 Scoping Plan provides strategies for achieving the 2030 target established by EO B-30-15 and codified in SB 32 (40 percent below 1990 levels by 2030). The 2017 Scoping Plan recommends local plan-level GHG emissions reduction goals.

2.4.2.4 SB 375

SB 375 aligns regional transportation planning efforts, regional GHG reduction targets, and affordable housing allocations. Metropolitan Planning Organizations (MPOs) are required to adopt a Sustainable Communities Strategy, which allocates land uses in the Metropolitan Planning Organization's Regional Transportation Plan. Qualified projects consistent with an approved Sustainable Communities Strategy or Alternative Planning Strategy and categorized as "transit priority projects" would receive incentives under new provisions of CEQA. SB 375 requires regional reduction targets for light duty passenger vehicle CO_2 emissions for each MPO.

2.4.2.5 AB 1493 (Pavley)

The Pavley Bill enacted in 2002 requires the maximum feasible and cost-effective reduction of GHGs from automobiles and light-duty trucks. In 2004, CARB approved the "Pavley I" regulations that applied to new passenger vehicles beginning with model year 2009 through 2016. Pavley I is expected to reduce GHG emissions from regulated vehicles by 30 percent from 2002 levels by 2016. Pavley II was incorporated into Amendments to the Low- Emission Vehicle Program referred to as LEV III. The amendments, effective August 7, 2012, apply to vehicles for model years 2017 through 2025. The regulation will reduce GHGs from new cars by 34 percent from 2016 levels by 2025 (CARB 2011).

2.4.2.6 Title 24 Energy Efficiency Standards

The State has adopted several other major regulations that will provide substantial reductions in GHGs. Title 24, Part 6 California's Energy Efficiency Standards for Residential and Nonresidential Buildings were first established in 1978 to reduce California's energy consumption. The California Energy Commission revises Title 24 about every three years to incorporate cost-effective energy efficiency technological advancements into the construction of new buildings. The latest version is the 2019 Title 24 update, which will go into effect January 1, 2020. The 2019 Title 24 standards include the requirement by the California Public Utilities Commission (CPUC) Energy Efficiency Strategic Plan for net zero energy consumption for new residential development starting in 2020 and will ultimately incorporate requirements for net zero in new non-residential development by 2030.

2.4.2.7 Green Building Code

The California Green Building Standard Code (CALGreen) was adopted in 2010 and went into effect January 2011 (CGBSC 2010). CALGreen is a mandatory green building code that sets minimum environmental standards for new buildings including standards for volatile organic compound (VOC) emitting materials, water conservation, and construction waste recycling.

2.4.2.8 Senate Bill 97

SB 97, enacted in 2007, amends the CEQA statute to clearly establish that GHG emissions and the effects of GHG emissions are appropriate subjects for CEQA analysis. The legislation directed the California Office of Planning and Research to develop draft CEQA Guidelines "for the mitigation of GHG emissions or the effects of GHG emissions" and directed the California Natural Resources

Agency to certify and adopt the State CEQA Guidelines. CEQA Guidelines Section 15183.5, Tiering and Streamlining the Analysis of GHG Emissions, was added as part of the CEQA Guideline amendments that became effective in 2010 and describes the criteria needed in a GHG reduction plan that would allow for the tiering and streamlining of CEQA analysis for development projects.

2.4.2.9 Senate Bill x7-7

SB x7-7 requires water suppliers to reduce urban per capita water consumption 20 percent from a baseline level by 2020.

2.4.2.10 Renewable Portfolio Standard

The Renewable Portfolio Standard (RPS) requires energy providers to derive 33 percent of their electricity from qualified renewable sources by 2020. In 2018, the State Assembly passed and Governor Jerry Brown signed SB 100, which requires energy providers to derive 60 percent of their electricity from qualified renewable sources by 2030 and 100 percent by 2045. The RPS is anticipated to lower emission factors (i.e., fewer GHG emissions per kilowatt-hour used) from utilities across the State, including Pacific Gas and Electric (PG&E).

2.4.2.11 Innovative Clean Transit (ICT) Regulation

The ICT regulation was adopted in December 2018 and requires all public transit agencies to gradually transition to a 100 percent zero-emission bus (ZEB) fleet. Beginning in 2029, 100 percent of new purchases by transit agencies must be ZEBs, with a goal for full transition by 2040. It applies to all transit agencies that own, operate, or lease buses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds. It includes standard, articulated, over-the-road, double-decker, and cutaway buses.

2.4.2.12 **Other Regulations**

The CARB has adopted numerous regulations on sources of GHGs since the approval of the Climate Change Scoping Plan. Some of the more notable regulations include the Low Carbon Fuel Standard (LCFS) and regulations affecting vehicle efficiency such as the Tire Pressure Program, Low Friction Oil, and Heavy Duty Vehicle Aerodynamic Efficiency Standards. Also important are CARB regulations that apply to high global warming potential consumer products and refrigerants. SB 734, which requires the Governor's Office of Planning and Research (OPR) to amend the CEQA Guidelines to provide an alternative to level of service (LOS) for evaluating transportation impacts. The law requires that those alternative criteria promote the reduction of GHG, the development of multimodal transportation networks, and a diversity of land uses.

2.4.3 Fresno County Council of Governments

2.4.3.1 SB 375 Regional Targets and Sustainable Community Strategy (SCS)

SB 375 aligns regional transportation planning efforts, regional GHG reduction targets, and affordable housing allocations. Metropolitan Planning Organizations (MPO) are required to adopt a Sustainable Communities Strategy (SCS), which allocates land uses in the Metropolitan Planning Organization Regional Transportation Plan (RTP). Qualified projects consistent with an approved SCS

or Alternative Planning Strategy and categorized as "transit priority projects" would receive incentives under new provisions of CEQA.

In 2010, as part of its mandate under SB 375, the CARB set specific GHG emission reduction targets for cars and light trucks for each of the State's 18 metropolitan planning organizations from a 2005 base year. The GHG targets set for the Fresno region in 2010 called for a 5 percent per capita reduction by 2020 and a 10 percent per capita reduction by 2035. SB 375 requires that Fresno Council of Governments (COG) demonstrate in its SCS that GHG emission reduction targets will be met for 2020 and 2035. If not, then an Alternative Planning Strategy (APS) shall be prepared to demonstrate how the targets can be met through the alternative strategies in the APS. These numbers are subject to changes due to model validation, calibration, and ongoing local coordination efforts. The MPO growth scenario focuses on existing core areas without expansion of the city of Fresno sphere of influence (CARB 2010). Under the General Plan, growth would be distributed along major corridors and activity centers supported by the Bus Rapid Transit (BRT) system, and has a theme of complete neighborhoods to provide convenient access to different uses at the neighborhood level. The strategy relies on a combination of increasing density, mixed uses, and infill.

The Fresno COG developed an SCS to implement SB 375 requirements. The SCS, adopted by the Fresno COG on June 26, 2014 demonstrated that Fresno County will be able to achieve the GHG targets for light-duty vehicle travel adopted by the CARB for this area. In July 2018, the Fresno COG adopted a second SCS based on the previous SCS adopted in 2014. The Fresno COG would be able to meet the CARB GHG targets through 2018 RTP/SCS (Fresno COG 2018).

2.4.3.2 San Joaquin Valley Blueprint

The San Joaquin Valley Blueprint Planning Process is an effort by agencies, organizations, and individuals, including the Fresno COG, to identify visions, values, guiding principles, and alternative growth scenarios for development over a 20-year planning horizon. The 2018 RTP/SCS continues the blueprint development process that started in 2006.

The adopted 12 Blueprint Smart Growth Principles from this process are:

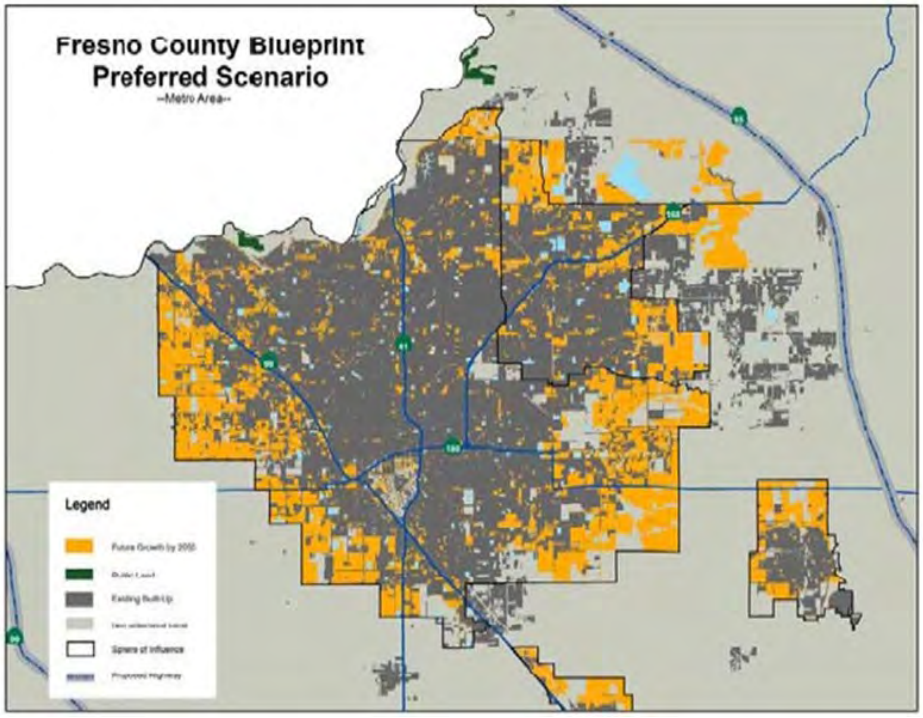
1. Create a range of housing opportunities and choices.
2. Create walkable neighborhoods.
3. Encourage community and stakeholder collaboration.
4. Foster distinctive, attractive communities with a strong sense of place.
5. Make development decisions predictable, fair, and cost-effective.
6. Mix land uses.
7. Preserve open space, farmland, natural beauty, and critical environmental areas.
8. Provide a variety of transportation choices.
9. Strengthen and direct development towards existing communities.
10. Take advantage of compact building design.
11. Enhance the economic vitality of the region.
12. Support actions that encourage environmental resource management.

Fresno County's Blueprint Vision is as follows:

- Fresno County will be composed of unique cities, communities and a diverse population in a connected high quality environment that accommodates anticipated population growth and is supported by:
    - A vibrant economy built on competitive strength and world class education
    - A healthy and sustainable environment where air, aquifers, surface waters, forests, soil, agriculture, open space and wildlife resources are enhanced and protected
    - A focus on cultural and community stewardship where all people enjoy fundamental rights as members of a free society, and where the community takes ownership of problems and their solutions.

The form of the Fresno region blueprint recognizes its economic, environmental, and cultural connectedness while maintaining a system of high-capacity multimodal transportation corridors that link the metro area to the rural areas and the State while preserving and maintaining the character of individual communities and the vital agricultural and natural resources between and around them (Fresno COG 2009). Figure 2-4 shows the Fresno County Blueprint preferred scenario.

Figure 2-4: Fresno County Blueprint Preferred Scenario



Source: Fresno Council of Governments (2009).

The Blueprint preferred scenario would result in a countywide average of 8.0 dwelling units/acre residential density for new growth between now and 2050. The density of new growth in the Fresno Clovis Metropolitan Areas (FCMA) will be 9.0 units/acre, while the average density of new development in the non-FCMA areas will be around 5.7 units/acre. This is comparable with the current trend density for Fresno county of 3.8 dwelling units/acre (Fresno COG 2009).

2.4.4 San Joaquin Valley Air Pollution Control District

The city of Fresno is within the San Joaquin Valley Air Basin, which is under the jurisdiction of the San Joaquin Valley Air Pollution Control District (SJVAPCD). The District has regulatory authority over certain stationary and industrial GHG emission sources and provides voluntary technical guidance on addressing GHGs for other emission sources in a CEQA context. District initiatives related to GHGs are described below.

2.4.4.1 Climate Change Action Plan

The District Governing Board approved the SJVAPCD Climate Change Action Plan (CCAP) on August 21, 2008. The CCAP began a public process to bring together stakeholders, land use agencies, environmental groups, and business groups, and to conduct public workshops to develop comprehensive policies for CEQA Guidelines, a carbon exchange bank, and voluntary GHG emissions mitigation agreements for the Governing Board's consideration. The CCAP contains the following goals and actions:

Goals.

1. Assist local land-use agencies with California Environmental Quality Act (CEQA) issues relative to projects with GHG emissions increases.

2. Assist Valley businesses in complying with mandates of AB 32 (Global Warming Solutions Act of 2006).

3. Ensure that climate protection measures do not cause increases in toxic or criteria pollutants that adversely impact public health or environmental justice communities.

Actions.

1. Develop GHG significance threshold(s) or other mechanisms to address CEQA projects with GHG emissions increases.

2. Develop necessary regulations and instruments for establishment and administration of the San Joaquin Valley Carbon Exchange Bank for voluntary GHG reductions created in the Valley.

3. Enhance the District's existing criteria pollutant emissions inventory reporting system to allow businesses subject to AB 32 emission reporting requirements to submit simultaneous streamlined reports to the District and the state of California with minimal duplication.

4. Develop and administer voluntary GHG emission reduction agreements to mitigate proposed GHG increases from new projects.

2.4.4.2 CEQA Greenhouse Gas Guidance

The District developed several resource documents that were used as guidance for developing the GHG Plan. The most important is the Guidance for Valley Land-use Agencies in Addressing GHG Emission Impacts for New Projects under CEQA, which is intended to assist local agencies in complying with CEQA and which contains a GHG threshold approach that has been widely accepted for use in the San Joaquin Valley and in other parts of the State. The District concluded that the existing science is inadequate to support quantification of the impacts that project-specific GHG emissions have on global climatic change. The District found that the effects of project-specific emissions to be cumulative, and without mitigation, their incremental contribution to global climatic change could be considered cumulatively considerable. The District found that this cumulative impact is best addressed by requiring all projects to reduce their GHG emissions, whether through project design elements or mitigation. Many San Joaquin Valley local jurisdictions, including Fresno, have used the District guidance for CEQA compliance.

The primary features of the District's approach include:

- Projects exempt from the requirements of CEQA, and projects complying with an approved plan or mitigation program would be determined to have a less than significant cumulative impact. The GHG Plan is intended to meet the criteria as an approved plan or mitigation program.

- Projects for which there is no applicable approved plan or program, or those projects not complying with an approved plan or program, the lead agency would evaluate the project against a performance-based standards and would require the adoption of design elements, known as a Best Performance Standard, to reduce GHG emissions.

- Projects incorporating Best Performance Standards would not require specific quantification of GHG emissions, and automatically would be determined to have a less than significant cumulative impact for GHG emissions.

2.4.4.3 San Joaquin Valley Carbon Exchange and Rule 2301

The District initiated work on the San Joaquin Valley Carbon Exchange in November 2008. The Exchange was implemented with the adoption of Amendments to Rule 2301 Emission Reduction Credit Banking on January 19, 2012. The purpose of the carbon exchange is to quantify, verify, and track voluntary GHG emissions reductions generated within the San Joaquin Valley.

The District incorporated a method to register voluntary GHG emission reductions with amendments to Rule 2301. The purposes of the amendments to the rule include the following:

- Provide an administrative mechanism for sources to bank voluntary GHG emission reductions for later use.

- Provide an administrative mechanism for sources to transfer banked GHG emission reductions to others for any use.

- Define eligibility standards, quantitative procedures, and administrative practices to ensure that banked GHG emission reductions are real, permanent, quantifiable, surplus, and enforceable.

The District is participating in a new program developed by the California Air Pollution Control Officers Association (CAPCOA) to encourage banking and use of GHG reduction credits referred to as the CAPCOA Greenhouse Gas Reduction Exchange (GHGRx). The GHGRx provides information on GHG credit projects within participating air districts. The District is one of the first to have offsets available for trading on the Exchange.

2.4.4.4 Community Emissions Reductions Program: Assembly Bill 617 (AB 617)

AB 617 requires the CARB and air districts to develop and implement a Community Emission Reduction Plan (CERP) with additional emissions reporting, monitoring, and reduction plans and measures in an effort to reduce air pollution exposure in disadvantaged communities. Given that 20 of the 30 most disadvantaged communities in California are in the San Joaquin Valley, this process is expected to bring additional clean air resources and strategies to many Valley communities.

South Central Fresno and the City of Shafter are the first Valley communities selected by the California Air Resources Board for investment of additional resources under AB 617. The Valley Air District has established a steering committee for each of these communities comprising community residents, businesses, community advocates, and government representatives to assist in the development and implementation of community air monitoring and emission reduction programs.

This page intentionally left blank

3.0 EMISSION INVENTORY

Emission inventories are compilations of emissions generated by sources in a geographic area at a given time. GHG emission inventories are reported in units of MT CO_2e emissions per year. Emission inventories identify the contribution of each type or category of emissions to the total inventory of pollutants of interest. Emission inventories help rank sources by size to determine those that are most important to control.

Inventories are required to determine existing conditions and to forecast emissions in future years to account for the effects of growth.

3.1 INVENTORY METHODS AND ASSUMPTIONS

3.1.1 Inventory Protocols

Emission inventory protocols have been developed for many emission sources by governmental and independent agencies, and professional associations. The U.S. Community Protocol for Accounting and Reporting of Greenhouse Gas Emissions, developed by ICLEI Local Governments for Sustainability, provides guidance for developing community inventories prepared in the United States. The U.S. Community Protocol is not entirely applicable to inventories in California communities. For some inventory categories, a more detailed inventory may be required to ensure its adequacy for use in a CEQA context. California specific emission factors and data are available for many sources that when used produce a more accurate inventory. The inventory prepared for the City of Fresno GHG Plan Update follows the U.S. Community Protocol as modified for use in California.

3.1.2 Baseline Inventory Source Categories

The City developed its year 2010 baseline GHG inventory, which included the following source sectors:

- Motor Vehicles
- Electricity Use (Residential and Commercial)
- Natural Gas Use (Residential and Commercial)
- Waste
- Off-Road Equipment
- Refrigerants

The inventory did not include sources that comprise less than 3 percent of the inventory and sources that are not within the control or influence of the City of Fresno. One exception is off-road equipment, which is less than 1 percent but is commonly included in project level GHG analyses. Large industrial sources of emissions that are subject to CARB's reporting regulation and Cap-and-Trade regulation were not included in the inventory. The inventory did not include impacts of upstream emissions (e.g., emissions associated with an extraction process for purchased fuels—extraction, production, and transportation of fuels) because those sources are not within the control or influence of the City.

3.2 BASELINE INVENTORY SELECTION CRITERIA

The baseline inventory year is important because it forms the starting point for setting emission reduction targets in future years. Several criteria were considered in selecting the best year for the baseline inventory, including:

- Data availability;
- Relationship with State inventories and targets; and
- Recommended practices from other agencies and organizations.

Since the AB 32 target is based on returning emissions to 1990 levels by 2020, some jurisdictions include a 1990 inventory. The 1990 baseline represents Statewide emissions and not the emissions of individual cities and counties. Growth rates vary widely from city to city since 1990. A 1990 inventory and target that do not account for variations in growth from community to community do not provide a valid comparison of the effectiveness or stringency of a GHG reduction program. In addition, the City cannot go back in time and change the amount and type of development that has occurred since 1990; it can only work from existing conditions. Therefore, the City had determined that a 2010 baseline provides the most recent year with complete data available suitable for describing existing conditions.

3.3 BASELINE INVENTORY

The City of Fresno baseline inventory year for the GHG Plan is 2010. The CARB has prepared an updated inventory for 2010 that accounts for regulations adopted to that point in time. Therefore, 2010 provides the best available baseline for the GHG Plan and can be compared directly with State progress to date and targets. Table 3-A shows the baseline inventory.

Table 3-A: GHG Emissions by Sector for 2010

Sector	2010 (MT CO_2e)	Percent of Total
Motor Vehicles	1,899,799	51
Electricity - Residential	327,813	9
Electricity - Commercial	361,836	10
Natural Gas - Residential	362,832	10
Natural Gas - Commercial	394,417	11
Waste	123,945	3
Off-road Equipment	1,051	<1
Ozone Depleting Substance (ODS) Substitutes	273,422	7
Total	**3,745,115**	**100**

Source: City of Fresno Greenhouse Gas Reduction Plan (2014).
MT CO_2e = metric tons of carbon dioxide equivalent

3.4 BASELINE INVENTORY UPDATE

In September 2018, ICLEI Local Governments for Sustainability developed an inventory update for the year of 2016 for the City through the Statewide Energy Efficiency Collaborative. This inventory update is more recent and captures the GHG reductions from Statewide and local measures since 2010, therefore better reflects the current GHG emission levels in the city. The inventory update has

different source categories than the 2010 baseline inventory. The 2016 inventory update includes Agriculture and Industrial Energy sectors, which are additional to the 2010 baseline inventory. Therefore, the 2016 inventory update is more complete. Table 3-B shows the source categories comparison between 2010 baseline inventory and 2016 inventory update.

Table 3-B: Source Categories Comparison Between 2010 and 2016 Inventories

2010 Baseline Inventory Sector	2016 Inventory Update Sector
Motor Vehicles	Transportation
Electricity - Residential	Residential Energy
Electricity - Commercial	Commercial Energy
Natural Gas - Residential	Residential Energy
Natural Gas - Commercial	Commercial Energy
Waste	Solid Waste
Off-road Equipment	Transportation
Ozone Depleting Substance (ODS) Substitutes	Fugitive Emissions
Not Included	Agriculture
Not Included	Industrial Energy

Source: Compiled by LSA Associates, Inc. (2019).

The City's total emissions in 2016 were 2,923,633 MT CO_2e. As shown in Table 3-C and Figure 3-1, the Transportation sector was the largest contributor to emissions in the 2016 inventory, with 52 percent of the City's total GHG emissions. Commercial and residential energy use were the second and third largest contributor of GHG emissions with 18 percent and 16 percent of total emissions, respectively. Fugitive emissions accounted for 9 percent of total emissions, solid waste accounted for 4 percent of total emissions, and industrial energy and agriculture sectors emitted less than 1 percent.

Table 3-C: City of Fresno 2016 Inventory Update and Business-as-Usual Projections

Sector	2016 (MT CO_2e)	Percent of Total	2020 (MT CO_2e)	Percent of Total	2030 (MT CO_2e)	Percent of Total	2035 (MT CO_2e)	Percent of Total
Transportation	1,520,052	52	1,594,888	52	1,798,498	51	1,909,852	52
Commercial Energy	524,838	18	557,142	18	627,373	18	657,379	18
Residential Energy	479,371	16	514,053	17	579,546	17	603,951	16
Fugitive Emissions	270,130	9	288,573	9	335,316	10	357,008	10
Solid Waste	119,167	4	127,303	4	147,923	4	157,493	4
Industrial Energy	10,055	<1%	10,506	<1%	11,528	<1%	12,035	<1%
Agriculture Energy	20	<1%	20	<1%	20	<1%	20	<1%
Total	**2,923,633**	**100**	**3,092,486**	**100**	**3,500,204**	**100**	**3,697,738**	**100**

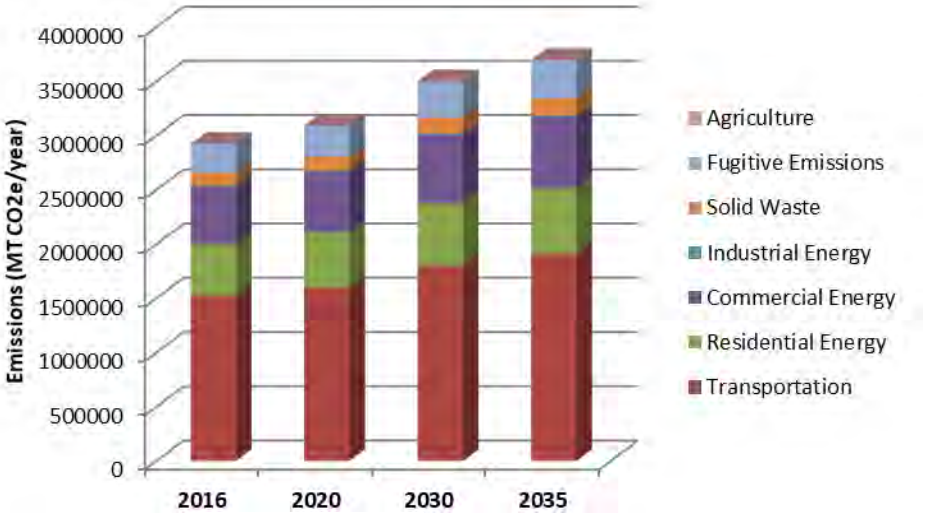
MT CO_2e = metric tons of carbon dioxide equivalent

Figure 3-1: City of Fresno 2016 Inventory Update and Business-as-Usual Projections



Source: Compiled by LSA Associates, Inc. (2019).

3.5 INVENTORY PROJECTIONS

The GHG Plan includes inventory projections for 2020, 2030, and 2035. The 2020 and 2030 forecast years are consistent with the goals identified in AB 32 and the 2017 Scoping Plan, which identify Statewide GHG reduction targets by 2020 and 2030. The 2035 forecast year correspond to the General Plan horizon and will allow the City to develop long-term strategies to continue GHG reductions.

3.5.1 BAU Inventory

BAU scenarios are commonly used in climate action planning to ensure that control measures are adequate to overcome the effects of cumulative growth in emissions by a target year. BAU is defined in the CARB AB 32 Scoping Plan as the forecasted GHG emissions through 2030 with existing policies and programs, but without any further action to reduce GHGs. BAU inventories allow for separate accounting of the benefits of regulations, strategies, and programs on future emissions.

The City's BAU GHG emissions for 2020, 2030, and 2035 were projected based on 2016 Inventory Update data using population, households, and employment growth rate from the Fresno County 2050 Growth Projections developed by Fresno County Council of Governments.[9] The BAU inventory for each forecast year is provided in Table 3-C and Figure 3-1.

[9] Applied Development Economics. 2017. Fresno County 2050 Growth Projections. Prepared for Fresno County Council of Governments. Website: www.fresnocog.org/wp-content/uploads/publications/Demographics/Fresno_COG_2050_Projections_Final_Report_050417.pdf (accessed March 4, 2019).

The BAU inventories presented above show that in the absence of regulations and other measures to reduce GHG emissions, the City's BAU emissions in 2020 are estimated to be 3,092,486 MT CO_2e, or a 5.8 percent increase from 2016 emissions. By 2030, emissions are estimated to increase 19.7 percent from the 2016 level to 3,500,204 MT CO_2e. By 2035, emissions are estimated to increase 26.5 percent from the 2016 level to 3,697,738 MT CO_2e.

This page intentionally left blank

4.0 REDUCTIONS FROM STATE REGULATIONS

The State has enacted many regulations pursuant to the requirements in AB 32 that would reduce emissions within the city. The State's strategy is detailed in the Climate Change Scoping Plan adopted by the CARB in November 2017. Scoping Plan strategies are primarily implemented through the adoption of regulations. The most important and applicable strategies from the previous iterations and most recent 2017 Scoping Plan are discussed below.

4.1 MOTOR VEHICLES

The CARB has adopted many Scoping Plan measures for mobile sources as regulations both in the previous versions and most recent Scoping Plan (CARB 2008, 2014 and 2017). Only the measures that have been adopted or put into practice are included in this assessment. The following regulations are included:

- **Pavley and Low Carbon Fuel Standard:** EMFAC2017 emission factors that include Pavley and the LCFS were used to estimate the impact of those regulations. In this way, the reductions from those measures are more specific than simply applying the statewide reduction estimates because the reductions in EMFAC take into account the variations between vehicle classes and region.

- **Low Emission Vehicle (LEV) III Standards:** The LEV III standards amend the exhaust and evaporative emission standards for passenger cars and light- and medium-duty trucks. The standards provide requirements for model years 2017 to 2025. The regulation applies to both criteria pollutant and GHG emissions. The standard drops GHG emission to 166 grams per mile, a reduction of 34 percent compared with 2016 levels. LEV III implements the Pavley II standards described in the Scoping Plan.

- **Tire Pressure Program:** This regulation is categorized under vehicle efficiency measures in the Scoping Plan. This regulation applies to automotive service providers performing or offering to perform automotive maintenance or repair services in California. This applies to passenger cars, light-duty trucks, medium-duty vehicles, and light heavy-duty trucks with gross vehicle weight ratings of less than or equal to 10,000 pounds (CARB 2010). This measure is anticipated to reduce emissions by 0.5 percent for those vehicle types.

- **Low Friction Oil:** CARB indicates that this measure has been achieved in practice. It is assumed that this measure would apply to the same vehicle types as in the tire pressure program. This measure is anticipated to reduce emissions by 2.2 percent.

- **Aerodynamic Efficiency:** This regulation improves the fuel efficiency of heavy-duty tractors that pull 53-foot or longer box-type trailers. Fuel efficiency is improved through improvements in tractor and trailer aerodynamics and the use of low rolling-resistance tires. This measure would reduce emissions by 2.1 percent from heavy-duty vehicles.

4.2 ENERGY

The State's strategy for reducing energy-related GHGs targets electric power utilities on the production side and energy efficiency on the consumer side. Two regulations are in place to reduce emissions from this source. The Renewable Portfolio Standard requires electric utilities to provide an increasing share of their energy from renewable sources with 33 percent by 2020, 60 percent by 2030, and 100 percent by 2045. Title 24 Energy Efficiency Standards for Residential and Non-Residential Buildings requires new structures to meet increasingly stringent energy efficiency standards. California's Green Building Code mandates increased water conservation that results in less electricity consumed to pump and transport water.

4.2.1 Renewable Portfolio Standard (RPS)

The electricity emission factor was decreased to account for the renewable energy regulations, which require 33 percent renewable energy by the year 2020, 60 percent by 2030, and 73 percent by 2035, which is interpolated from the 100 percent by 2045 requirement. The average renewable energy use for 2005-2009 for PG&E was calculated as 12.6 percent (California Public Utilities Commission 2013). Based on an approximation of electric generation from RPS-eligible sources divided by forecasted electricity retail sales for the year 2018, the Energy Commission estimates that 34 percent of California’s retail electricity sales in 2018 will be provided by RPS-eligible renewable resources. This shows that the State is already ahead of its 2020 goal (CEC 2018).

4.2.2 Title 24, Part 6 Building Energy Efficiency Standards

Building energy efficiency standards are designed to ensure that new and existing buildings achieve energy efficiency and preserve outdoor and indoor environmental quality. These standards are contained in the California Code of Regulations (CCR) Title 24, Part 6. The California Energy Commission (CEC) is required by State law to update energy efficiency standards every 3 years. The 2019 Standards, which will become effective in January 2020, are focused on achieving zero net energy (ZNE) homes by increasing energy efficiency and requiring solar photovoltaic (PV) systems for new homes (CEC 2019).

The reductions from Title 24 are applied to the energy consumption related emissions for new development and remodeling projects at existing buildings subject to the regulations. The benefits of the standards accrue as buildings subject to the standards are constructed to meet the standard applicable at the time. PG&E provided actual electricity and natural gas usage for 2008 through 2010, which reflect the benefits of all development subject to previous versions of the Title 24 standards. New development would provide additional reductions as buildings are constructed to comply with the latest standards.

4.2.3 California's Green Building Standard Code

CCR Title 24, Part 11 (California Green Building Standard Code [CALGreen]), was adopted on January 12, 2010. The State Building Standards Commission unanimously adopted updates to the California Green Building Standards Code, which went into effect on January 1, 2011. The Code is a comprehensive and uniform regulatory code for all residential, commercial, and school Buildings. Further updates to CALGreen went into effect on January 1, 2017. CALGreen is the first Statewide

mandatory green building code and significantly raises the minimum environmental standards for construction of new buildings in California. The mandatory provisions in CALGreen will reduce the use of VOC-emitting materials, will strengthen water conservation, and will require construction waste recycling.

4.3 REFRIGERANTS

The State has adopted several refrigerant management regulations that are anticipated to achieve substantial reductions. For example, CARB predicts that the regulations that will apply to large commercial refrigeration units will reduce emissions by more than 50 percent.

4.4 REDUCTIONS FROM STATE REGULATIONS

The predicted reduction in emissions from State measures on city of Fresno emissions is shown in Table 4-A.

Table 4-A: Reductions from Statewide Measures

Sector	State Measures	Emission Reductions (MT CO_2e/year)		
		2020	2030	2035
Transportation	Pavley and Low Carbon Fuel Standard; Low Emission Vehicle Program III; Tire Tread Program; Tire Pressure Program; Low Friction Oil; HD Aerodynamic/MHD Hybridization	424,559	667,463	836,897
Residential Energy	Renewable Portfolio Standards	164,477	299,049	363,843
	Title 24 – Electricity	16,833	79,525	102,708
	Title 24 – Natural Gas	7,983	10,762	12,496
Commercial Energy	Renewable Portfolio Standards	174,877	317,958	386,849
	Title 24 – Electricity	9,614	5,532	4,196
	Title 24 – Natural Gas	17,530	12,933	11,108
Fugitive Emissions	Limit High GWP Use in Consumer Products; Motor Vehicle Air Conditioning; High GWP Refrigerant Management Program for Stationary Sources	144,287	167,658	178,504
	Total	**960,160**	**1,560,880**	**1,896,602**

Source: Compiled by LSA Associates, Inc. (2019).
GWP = global warming potential
HD = Heavy Duty
MHD = Medium Heavy Duty
MT CO_2e/year = metric tons of carbon dioxide equivalent per year

4.4.1 Adjusted Business-as-Usual

The adjusted business-as-usual (ABAU) inventory applies emission reductions achieved by Statewide regulations, programs, and measures. This inventory identifies the base from which reductions are needed from local strategies and measures to demonstrate consistency with the State-aligned targets. Table 4-B shows the emission inventories for each year after the application of State regulatory measures.

Table 4-B: City of Fresno Adjusted Business-as-Usual Emissions

Sector	2016	2020	2030	2035
Transportation	1,520,052	1,170,329	1,131,034	1,072,955
Commercial Energy	524,838	355,121	290,950	255,226
Residential Energy	479,371	324,760	190,210	124,904
Fugitive Emissions	270,130	144,287	167,658	178,504

4.4.2 Target Analysis

The State has set goals for reducing GHG emissions by 2020, 2030, and 2050 through AB 32, SB 32, and EO B-30-15, respectively. The State has also provided guidance to local jurisdictions as "essential partners" in achieving the State's goals by identifying a 2020 recommended reduction goal. That goal, stated in the AB 32 Scoping Plan, was for local governments to achieve a 15 percent reduction below baseline levels by 2020, which aligns with the State's goal of not exceeding 1990 emissions levels by 2020. The State's long-term target is to emit no more than 20 percent of 1990 levels by 2050 (or, a reduction of 80 percent below 1990 levels by 2050). The State has also provided an interim target, which is 40 percent below 1990 levels by 2030. It is clear that the issue of climate change will not end in 2030 and continued reduction goals should be implemented to keep the State on a path toward the 2050 goal. A straight-line projection from the 2030 to 2050 goals would result in a reduction goal of 58 percent below baseline levels by 2035.

In order to keep the City of Fresno GHG Reduction Plan in line with the State's reduction goals, the targets, as shown in Table 4-C, have been identified. Based on these targets, the City would meet the reduction target from an ABAU forecast in 2020. In 2030 and 2035, the City would need to reduce 29,316 MT CO_2e and 209,463 MT CO_2e emissions below the ABAU scenario, respectively, to meet the State-aligned target (Table 4-C and Figure 4-1).

Table 4-C: State-Aligned GHG Emission Reduction Targets By Year

Sector	2010[1]	2016	2020	2030	2035
BAU Emissions (MT CO_2e)	3,745,115	2,923,633	3,092,486	3,500,204	3,697,738
Adjusted BAU Emissions (MT CO_2e)	3,745,115	2,923,633	2,132,326	1,939,325	1,801,137
State-Aligned Target (Percent change from 1990)			0	-40	-50
State-Aligned Target (Percent change from 2010)			-15	-49	-58
State-Aligned Emissions Goal (MT CO_2e)			3,183,348	1,910,009	1,591,674
Reductions from Adjusted BAU needed to meet the State-Aligned Target (MT CO_2e)			Target Met	29,316	209,463

5.0 GREENHOUSE GAS REDUCTION STRATEGY

The GHG Reduction Plan is a comprehensive vision of the City's plan to reduce GHG emissions. The City is already on a path toward lower emissions through its prior actions. The City has adopted a several goals, policies, and programs from the General Plan that contributed towards reducing GHG emissions. The General Plan provides a comprehensive strategy to reduce GHG emissions from all sources within the City's ability to control or influence. The strategies enhance the effectiveness of State strategies by ensuring that the city is developed in ways that minimize emissions and by application to City-owned facilities. The relevant General Plan objectives and policies are listed throughout the following section. For convenience, a compilation of the General Plan objectives and policies is provided as Appendix A to this GHG Plan Update. Table 5-A provides a listing of General Plan Elements/Chapters and the associated letter designations to enable the reader to identify the General Plan Element/Chapter associated with the objectives and policies listed in this section.

Table 5-A: General Plan Chapter Cross Reference

General Plan Element and Chapter	Policy Prefix
Urban Form (Chapter 3)	UF
Land Use (Chapter 3)	LU
Design (Chapter 3)	D
Mobility and Transportation (Chapter 4)	MT
Park and Open Space (Chapter 5)	POSS
Public Utilities and Services (Chapter 6)	PU
Resource Conservation and Resilience (Chapter 7)	RC
Healthy Communities (Chapter 10)	HC
Economic Development and Fiscal Sustainability (Chapter 2)	ED

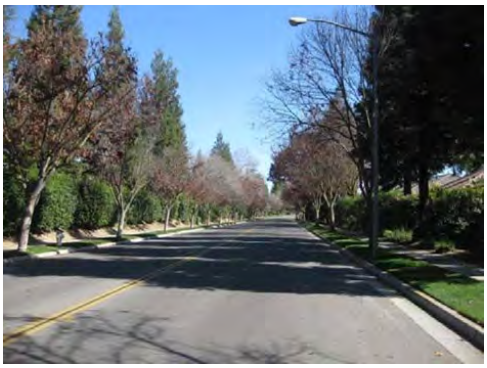
Source: FirstCarbon Solutions. 2014. Fresno General Plan Update, Greenhouse Gas Reduction Plan, prepared for the City of Fresno. July. Website: https://www.fresno.gov/darm/wp-content/uploads/sites/10/2016/11/F-2-Greenhouse-Gas-Reduction-Plan.pdf (accessed December 2019).

5.1 GHG PLAN REDUCTION STRATEGY

The City can control or influence GHG emissions in several ways. The City has direct control over its own fleet vehicles and buildings where it can use its budgeting authority and purchasing decisions for high efficiency/low emission options. The City has influence over emissions from development and redevelopment projects through its land use authority and its responsibilities as a Lead Agency under CEQA. The City can also provide leadership and education to the community to encourage voluntary actions to reduce GHG emissions. The General Plan provides the comprehensive objectives and policies that direct development in the city. The GHG Plan Update relies upon the General Plan as the basis of the development related strategies to reduce GHG emissions.

Greenhouse gas emissions are generated by a multitude of sources and activities. There is no single technology or individual program that provides a silver bullet for addressing this problem. Comprehensive solutions on multiple fronts are required to make the progress needed to achieve reduction targets for 2020, 2030 and beyond.

The GHG Plan Update strategies are categorized as follows:



- Land Use and Transportation
- Transportation Facilities Strategies
- Transportation Demand Strategies
- Energy Conservation Strategies for New and Existing Buildings
- Water Conservation Strategies
- Waste Diversion and Recycling and Energy Recovery
- Strategies for Existing Development
- Municipal Strategies

As described in the previous section, motor vehicle emissions dominate the City's emission inventory. The City has control over the emissions from its government fleet vehicles through its purchasing decisions, but no control over the emissions from other vehicles that operate in and pass through the city. However, the City's authority over land use provides opportunities to influence the amount people drive and their choice of travel mode. In planning circles, this is called the land use, transportation, air quality connection.

Land use and transportation strategies are supported by the General Plan land use and circulation plans and policies that provide the City's vision of future development in the planning area to the extent that they reduce vehicle trips and miles traveled compared with alternative development plans and patterns. The City's General Plan includes many land use and transportation policies that when implemented result in lower greenhouse gas emissions through the promotion of smart growth; jobs/housing balance; transit-oriented development; and infill development through that application of land use designations, and zoning, and the use of public-private partnerships to encourage action.

The following are land use strategies utilizing goals and policies in the General Plan that with application to individual projects will achieve GHG emission reductions. Key GHG Plan Update indicators associated with the applicable General Plan policies are also identified to help the individual projects account for GHG emission reductions.

5.1.1 Land Use Strategies

Development that is more dense and compact places people closer to destinations that can be accessed by walking or bicycling, and transit. Higher densities near transit routes and facilities also increases the potential for more frequent high-quality transit service such as BRT. The General Plan includes the following related policy.

Policy RC-2-a **Link Land Use to Transportation.** Promote mixed-use, higher density infill development in multi-modal corridors. Support land use patterns that make more efficient use of the transportation system and plan future transportation investments in areas of higher-intensity development. Discourage investment in infrastructure that would not meet these criteria.

5.1.1.1 Compact and Infill Development

The General Plan provides for a substantial increase in development density in new growth areas compared to existing development. In addition, development trends show that more project developers can be expected to propose higher-density, single- and multi-family development than was constructed in the past. The General Plan land use designations provide density ranges that allow for higher average densities than experienced in the past for land already designated by the General Plan. The General Plan provide an increase in density in new growth areas.

Higher-density development tends to produce fewer vehicle trips per dwelling unit and more intense commercial development increases opportunities for walking, bicycling, and transit use for some trips. Although higher density is a prerequisite for achieving compact development, the design of the new projects is critical for maximizing reductions from being more compact related to walking, bicycling, and transit use. Approved but undeveloped subdivisions would comply with existing General Plan designations; however, market forces could result in requests for revisions to these subdivisions that would increase development density. Another way to increase density is to allow second units on residential lots. This practice increases overall development density and promotes more compact development that brings more people closer to commercial development.

Relevant General Plan Policies.

Policy UF-1-c **Identifiable City Structure**. Focus integrated and ongoing planning efforts to achieve an identifiable city structure, comprised of a concentration of buildings, people, and pedestrian-oriented activity in Downtown; along a small number of transit-oriented, mixed-use corridors and strategically located Activity Centers; and in existing and new neighborhoods augmented with parks and connected by multi-purpose trails and tree-lined bike lanes and streets.

Objective UF-12 Locate roughly one-half of future residential development in infill areas—defined as being within the City on December 31, 2012—including the Downtown core area and surrounding neighborhoods, mixed-use centers and transit-oriented development along major BRT corridors, and other non-corridor infill areas, and vacant land.

Policy UF-12-b **Activity Centers.** Mixed-use designated areas along BRT and/or transit corridors are appropriate for more intensive concentrations of urban uses. Typical uses could include commercial areas; employment centers; schools; compact residential development; religious institutions; parks; and other gathering points where residents may interact, work, and obtain goods and services in the same place.

Policy LU-2-a **Infill Development and Redevelopment.** Promote development of vacant, underdeveloped, and redevelopable land within the City Limits where urban services are available by considering the establishment and implementation of supportive regulations and programs.

Policy LU-2-b **Infill Development for Affordable Housing.** Establish a priority infill incentive program for residential infill development of existing vacant lots and underutilized sites within the City as a strategy to help to meet the affordable housing needs of the community.

Policy LU-3-b **Mixed-Use Urban Corridors that Connect the Downtown Planning Area.** Support the development of mixed-use urban corridors that connect the Downtown Planning Area with the greater Fresno-Clovis Metropolitan Area with functional, enduring, and desirable urban qualities along the Blackstone Avenue, Shaw Avenue, California Avenue, and Ventura Avenue/Kings Canyon corridors, as shown on Figure LU-1: General Plan Land Use Diagram.

Policy LU-3-c **Zoning for High Density on Major BRT Corridors.** Encourage adoption of supportive zoning regulations for compact development along BRT corridors leading to the Downtown Core that will not diminish long-term growth and development potential for Downtown.

Policy LU-5-f **High Density Residential Uses**. Promote high-density residential uses to support Activity Centers and BRT corridors, and walkable access to transit stops.

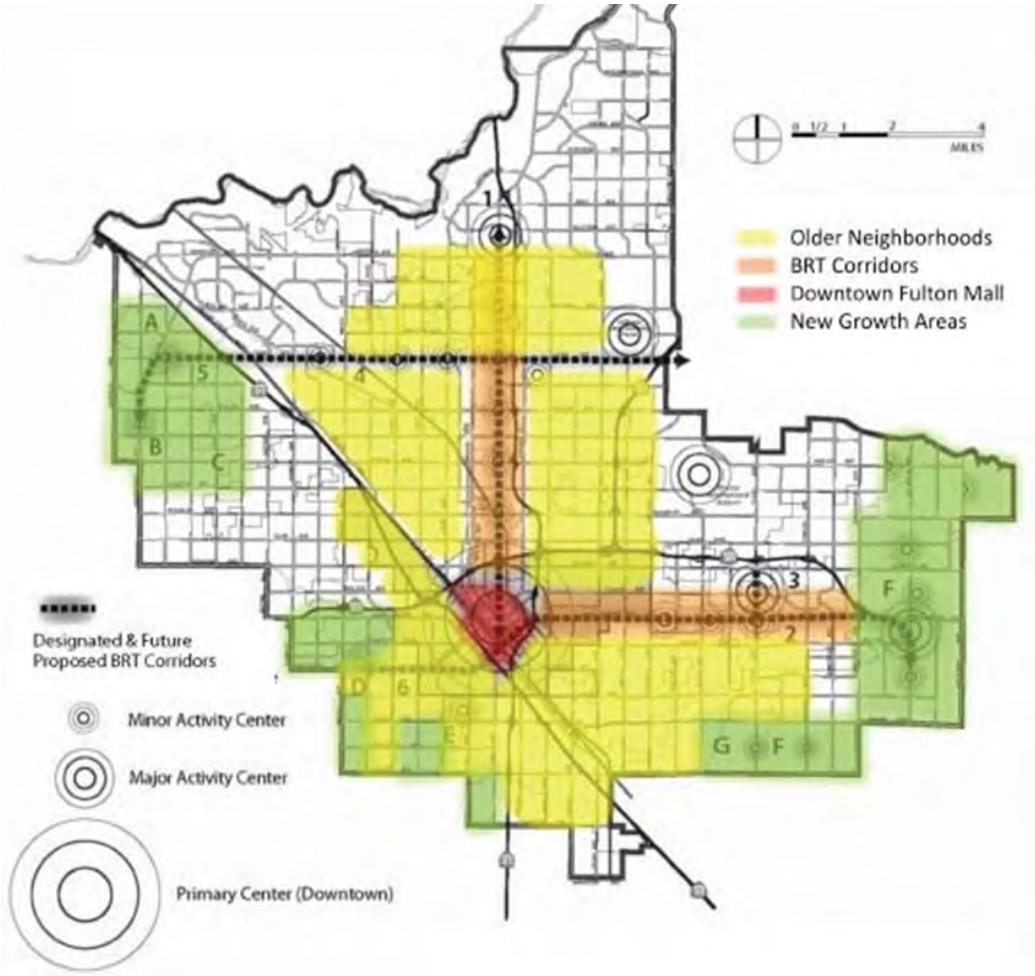
Policy RC-2-a **Link Land Use to Transportation.** Promote mixed-use, higher density infill development in multi-modal corridors. Support land use patterns that make more efficient use of the transportation system and plan future transportation investments in areas of higher-intensity development. Discourage investment in infrastructure that would not meet these criteria.

Figure 5-1 illustrates the conceptual location for the city of Fresno growth areas and the proposed BRT corridor. Compact development and infill provide the supporting base that maximizes the potential reductions in GHG emissions from the Plan strategy. Increased density, strategically located near quality transit and activity centers, is critical to successful implementation.

Key GHG Plan Indicators.

- Change in development density with time.
- Number of infill and redevelopment projects proposed.
- Changes in transit service and ridership.
- Compile ongoing development statistics for comparison with General Plan Policy objectives.
- Projects comply with General Plan policies.

Figure 5-1: City of Fresno Growth Areas and Proposed BRT Corridors



Source: City of Fresno (2019).

5.1.1.2 Mixed-Use Development

Mixed-use projects provide opportunities for walking between uses for some trips. Trips are reduced when visitors can park once at the development and obtain services, shopping, or go to a restaurant during a single trip. There are a variety of mixed-use development types with different mixes of uses and designs. Infill projects that provide residential development close to existing commercial development or vice versa can produce many of the same mixed-use benefits if done in a walkable environment.

Relevant General Plan Policies.

Policy RC-2-a **Link Land Use to Transportation.** Promote mixed-use, higher density infill development in multi-modal corridors. Support land use patterns that make more efficient use of the transportation system and plan future transportation investments in areas of higher-intensity development. Discourage investment in infrastructure that would not meet these criteria.

Policy RC-2-b **Provide Infrastructure for Mixed-Use and Infill.** Promote investment in the public infrastructure needed to allow mixed-use and denser infill development to occur in targeted locations, such as expanded water and wastewater conveyance systems, complete streetscapes, parks and open space amenities, and trails. Discourage investment in infrastructure that would not meet these criteria.

Policy UF-12-d **Appropriate Mixed-Use.** Facilitate the development of vertical and horizontal mixed-uses to blend residential, commercial, and public land uses on one or adjacent sites. Ensure land use compatibility between mixed-use districts in Activity Centers and the surrounding residential neighborhoods.

Policy UF-12-f **Mixed-Use in Activity Centers.** Update the Development Code which includes use regulations and standards to allow for mixed uses and shared parking facilities.

Key GHG Plan Indicators.

- The number of mixed use projects proposed.
- The number of mixed use project constructed.

5.1.1.3 Pedestrian-Oriented Development

Providing pedestrian-friendly infrastructure such as sidewalks, paths, and direct connections to neighboring uses such as shopping, schools, libraries, and parks increase the potential for people to make trips on foot instead of making a car trip.

This strategy is consistent with the Complete Streets concept that aims to make streets safe for walking and bicycling.

Relevant General Plan Policies.

Policy UF-12-e **Access to Activity Centers.** Promote adoption and implementation of standards supporting pedestrian activities and bicycle linkages from surrounding land uses and neighborhoods into Activity Centers and to transit stops. Provide for priority transit routes and facilities to serve the Activity Centers.

Policy UF-12-f	**Mixed-Use in Activity Centers.** Update the Development Code which includes use regulations and standards to allow for mixed uses and shared parking facilities.
Objective UF-14	Create an urban form to facilitate multi-modal connectivity.
Policy UF-14-a	**Design Guidelines for Walkability.** Develop and use design guidelines and standards for a walkable and pedestrian-scaled environment with a network of streets and connections for pedestrians and bicyclists, as well as transit and autos.
Policy UF-14-b	**Local Street Connectivity.** Design local roadways to connect throughout neighborhoods and large private developments with adjacent major roadways and pathways of existing adjacent development. Create access for pedestrians and bicycles where a local street must dead end or be designed as a cul-de-sac to adjoining uses that provide services, shopping, and connecting pathways for access to the greater community area.
Policy UF-14-c	**Block Length**. Create development standards that provide desired and maximum block lengths in residential, retail, and mixed-use districts in order to enhance walkability.
Policy D-3-c	**Local Streets as Urban Parkways.** Develop local streets as "urban parkways", where appropriate, with landscaping and pedestrian spaces.
Policy D-4-b	**Incentives for Pedestrian-Oriented Anchor Retail.** Consider adopting and implementing incentives for new pedestrian-friendly anchor retail at intersections within Activity Centers and along corridors to attract retail clientele and maximize foot traffic.
Policy MT-1-h	**Update Standards for Complete Streets.** Update the City's Engineering and Street Design Standards to ensure that roadway and streetscape design specifications reflect the Complete Streets concept, while also addressing the needs of through traffic, transit stops, bus turnouts, passenger loading needs, bike lanes, pedestrian accommodation, and short- and long-term parking.

Key GHG Plan Indicators.

- Project compliance with General Plan Policies

5.1.1.4 Transit-Oriented Development

Long-term development trends for increasing density and mixes of uses can lead to improved transit service in key areas of Fresno over time. Higher densities when combined with pedestrian orientation encourage transit use. A key factor is that both ends of the transit trip must be walkable and have the potential to serve reasonably large numbers of transit riders. The City's existing BRT

system combined with plans to increase development densities at BRT stations and along the corridor are critical elements of the City's transit oriented development strategy.

Relevant General Plan Policies.

Objective UF-12 Locate roughly one-half of future residential development in infill areas—defined as being within the City on December 31, 2012—including the Downtown core area and surrounding neighborhoods, mixed-use centers and transit-oriented development along major BRT corridors, and other non-corridor infill areas, and vacant land.

Policy UF-12-a **BRT Corridors.** Design land uses and integrate development site plans along BRT corridors, with transit-oriented development that supports transit ridership and convenient pedestrian access to bus stops and BRT station stops.

Policy UF-12-b **Activity Centers.** Mixed-use designated areas along BRT and/or transit corridors are appropriate for more intensive concentrations of urban uses. Typical uses could include commercial areas; employment centers; schools; compact residential development; religious institutions; parks; and other gathering points where residents may interact, work, and obtain goods and services in the same place.

Key GHG Plan Indicators.

- Comparison of development approved in infill areas versus non-infill areas such as comparison of development approved within 0.5 mile of BRT stations and 0.25 mile of transit stations versus non-BRT/non-transit station areas.
- Project designs consistent with General Plan policies.

5.1.2 Transportation Facilities Strategies

The following are strategies related to transportation infrastructure and facilities that encourage the use of alternative modes of transportation such as walking, bicycling, and transit use. This strategy would be implemented through support for and funding of transit, bicycle, and pedestrian connections, through transit and trail planning, and with regional cooperation among relevant agencies.

5.1.2.1 Transit Facilities

Transit facilities include bus stops, bus turnouts, multimodal transfer centers, and information kiosks. These facilities increase the comfort and convenience of using transit and minimize impacts on traffic flow from buses stopping for riders and re-entering traffic. Overall increases in transit service through the addition of new buses, new routes, and more frequent stops can also provide increased transit mode share. Transit

facility improvements are often provided by development projects in new growth areas as conditions of approval and mitigation measures. The improvements can also be provided as retrofits on existing streets and upgrades to existing transit stops using transportation funding.

Relevant General Plan Policies.

Objective MT-8 Provide public transit options that serve existing and future concentrations of residences, employment, recreation and civic uses and are feasible, efficient, safe, and minimize environmental impacts.

Policy MT-8-a **Street Design Coordinated with Transit**. Coordinate the planning, design, and construction of the major roadway network with transit operators to facilitate efficient direct transit routing throughout the Planning Area.

Policy MT-8-b **Transit Serving Residential and Employment Nodes**. Identify the location of current and future residential and employment concentrations and Activity Centers throughout the transit service area in order to facilitate planning and implementation of optimal transit services for these uses. Work with California State University, Fresno to determine locations within the campus core for bus stops.

Policy MT-8-g **High Speed Train**. If the State moves forward with HST, ensure it is constructed through Fresno in a manner that minimizes impacts to surrounding property owners and creates the most opportunity for redevelopment around the HST station.

Objective MT-9 Provide public transit opportunities to the maximum number and diversity of people practicable in balance with providing service that is high in quality, convenient, frequent, reliable, cost effective, and financially feasible.

Key GHG Plan Indicators.

- Transit route expansions
- Transit ridership trends
- Transition toward zero emission vehicles

5.1.2.2 Bicycle and Pedestrian Infrastructure

Adequate pedestrian infrastructure connecting frequently accessed destinations is critical to an increase in walking trips. Pedestrian infrastructure should be incorporated into project designs for new development, but also can be retrofitted in existing neighborhoods with barriers to walking such as lack of sidewalks or dangerous crossings.

Bicycle infrastructure including separate bicycle paths and bicycle lanes on roadways can increase the safety of cyclists and

encourage the use of this travel mode. Bicycle paths designed to provide more direct connections shorten travel distances and maximize safety. Bicycle lanes are less costly and can more easily connect multiple destinations for cyclists. The City of Fresno has an aggressive program in place to construct bike lanes and paths throughout the city. All new development is required to comply with the Bicycle, Pedestrian, and Trails Master Plan. Most arterials are now equipped with striped bike lanes. The City has also been installing sensors in the bike lanes that will trigger traffic lights to change when no motor vehicles are present.

Relevant General Plan Policies.

Objective MT-4 Establish and maintain a continuous, safe, and easily accessible bikeways system throughout the metropolitan area to reduce vehicle use, improve air quality and the quality of life, and provide public health benefits.

Policy MT-4-a **Active Transportation Plan**. To the extent consistent with this General Plan, continue to implement and periodically update the Active Transportation Plan to meet State standards and requirements for recommended improvements and funding proposals as determined appropriate and feasible.

Policy MT-4-b **Bikeway Improvements.** Establish and implement property development standards to assure that projects adjacent to designated bikeways provide adequate right-of- way and that necessary improvements are constructed to implement the planned bikeway system shown on Figure MT-2 to provide for bikeways, to the extent feasible, when existing roadways are reconstructed; and alternative bikeway alignments or routes where inadequate right-of-way is available.

Policy MT-4-c **Bikeway Linkages.** Provide linkages between bikeways, trails and paths, and other regional networks such as the San Joaquin River Trail and adjacent jurisdiction bicycle systems wherever possible.

Objective MT-5 Establish a well-integrated network of pedestrian facilities to accommodate safe, convenient, practical, and inviting travel by walking, including for those with physical mobility and vision impairments.

Policy MT-5-a **Sidewalk Development.** Pursue funding and implement standards for development of sidewalks on public streets, with priority given to meeting the needs of persons with physical and vision limitations; providing safe routes to school; completing pedestrian improvements in established neighborhoods with lower vehicle ownership rates; or providing pedestrian access to public transportation routes.

Objective MT-6 Establish a network of multi-purpose pedestrian and bicycle paths, as well as limited access trails, to link residential areas to local and regional open spaces and recreation areas and urban Activity Centers in order to enhance Fresno's recreational amenities and alternative transportation options.

Policy MT-6-a **Link Residences to Destinations.** Design a pedestrian and bicycle path network that links residential areas with Activity Centers, such as parks and recreational facilities, educational institutions, employment centers, cultural sites, and other focal points of the city environment.

Policy MT-6-g **Path and Trail Development.** Require all projects to incorporate planned multi-purpose path and trail development standards and corridor linkages consistent with the General Plan, applicable law and case-by-case determinations as a condition of project approval.

Policy POSS-7-h **Interlink City and San Joaquin River Parkway Trail Networks.** Strive to connect the parkway trail network to other trails in the vicinity, in order to create a community and regional trail system that offers a variety of different route combinations and enhances public access to the parkway.

Key GHG Plan Indicators.

- Active Transportation Plan implementation progress (projects funded and constructed).
- Developer funded and constructed bicycle and pedestrian projects.
- Compliance with General Plan policies and Development Code.

5.1.2.3 Traffic Calming Features

Design features and strategies to reduce vehicle speeds and reduce conflicts with pedestrians encourage more walking. Slower speeds encouraged by traffic calming can also improve safety and increase bicycling. Providing on-street parking, or street trees and landscaping to separate vehicles from pedestrians improve walkability.

Relevant General Plan Policies.

Policy MT-1-i **Local Street Standards.** Establish and implement local roadway standards addressing characteristics such as alignment, width, continuity and traffic calming, to provide efficient neighborhood circulation; to allow convenient access by residents, visitors, and public service and safety providers; and to promote neighborhood integrity and desired quality of life by limiting intrusive pass-through traffic.

Policy MT-1-j **Transportation Improvements Consistent with Community Character.** Prioritize transportation improvements that are consistent with the character of surrounding neighborhoods and supportive of safe, functional and Complete

Neighborhoods; minimize negative impacts upon sensitive land uses such as residences, hospitals, schools, natural habitats, open space areas, and historic and cultural resources.

In implementing this policy, the City will design improvements to:

- Facilitate provision of multi-modal transportation opportunities;
- Provide added safety, including appropriate traffic calming measures;
- Promote achievement of air quality standards;
- Provide capacity in a cost effective manner; and
- Create improved and equitable access with increased efficiency and connectivity.

Policy MT-5-e **Traffic Management in Established Neighborhoods.** Establish acceptable design and improvement standards and provide traffic planning assistance to established neighborhoods to identify practical traffic management and calming methods to enhance the pedestrian environment with costs equitably assigned to properties receiving the benefits or generating excessive vehicle traffic.

Key GHG Plan Indicators.

- Project compliance with General Plan Policies

5.1.3 Transportation Demand Strategies

These strategies provide programs and facilities that encourage employees to use alternative modes for commute trips.

5.1.3.1 Transportation Demand Management

Transportation Demand Management (TDM) refers to measures designed to reduce the demand for transportation facilities that are usually implemented at employment sites and event centers. These include programs targeting employee commute trips at the worksite such as vanpools, and incentives for alternative transportation and government-operated programs such as rideshare matching and outreach and incentives. Event center TDM measures involve the use of shuttles, encouraging carpooling, and staggering arrival and departure times to reduce congestion.

Large existing and new employers are required by existing regulations to implement TDM programs. The SJVAPCD has adopted Rule 9410 Employer Based Trip Reduction, which requires employers with over 100 employees to implement trip reduction programs. (SJVAPCD 2009) The rule targets employee commute trips and requires large employers to implement measures that reduce VMT by increasing transit use, carpooling, vanpooling, bicycling, or other measures to reduce trips. The SJVAPCD estimates that the rule will reduce light-duty mobile source criteria pollutants by approximately 6.8 percent by 2023 (SJVAPCD 2009). Similar reductions in greenhouse gas emissions would also be achieved with the reduction in trips and vehicle miles traveled from the rule.

End-of-trip facilities include items such as showers and lockers for people who bicycle to work, secure bike parking, onsite services such as dry cleaning pick-up and cafeterias, and break rooms to reduce trips for errands and lunch. These are measures intended to increase the convenience and reduce potential negatives associated with bicycling to work and to eliminate the need for some trips during the workday. End-of-trip facilities are often included as design features in large projects to attract employees and may be selected by businesses as compliance options for Rule 9410.

Relevant General Plan Policies.

Policy MT-10-c **Transportation Demand Management Guidelines.** Establish transportation demand management guidelines to allow for reduced off-street parking requirements.

5.1.3.2 Parking Measures

Providing limited parking is one of the most effective transportation measures. Use of parking structures and paid parking provide a strong incentive to use alternative modes and to take advantage of carpools and vanpools. This measure would only apply in higher-density development areas, downtown, and mixed-use projects specifically designed for this strategy.

Relevant General Plan Policies.

Policy MT-10-a **Updating Parking Standards.** Update off-street parking standards to reflect the context and location within activity areas of multiple uses and reductions appropriate for mixed residential and non-residential uses and proximity to existing or planned transit service.

Policy MT-10-b **Shared Parking.** Establish a strategy to promote the sharing of excess parking between uses within Activity Centers and BRT corridors, including specific provisions for this in the Development Code.

Policy MT-10-d **Parking Maximums.** Explore maximum off-street parking limits within Activity Centers proximate to BRT corridors, if such an Activity Center is determined compatible with promotion of a healthy and vigorous business environment.

Policy MT-10-f **Parking Benefit Districts.** Establish parking benefit districts to fund consolidated public parking where supported by local businesses.

Key GHG Plan Indicators.

- Completion of parking standards update incorporating the policies
- Projects with shared parking approved
- Employers and educational facilities participating in subsidized transit programs

5.1.3.3 Electric Vehicle Charging Stations

Infrastructure to charge electric vehicles while at work or other destinations would allow longer distance commuters and other drivers to use electric vehicles without concern for running out of charge on the return trip. Quick-charge technologies are in development that can partially charge a car battery in 15 minutes. Once quick-charging stations are widely available, the range impediment of electric vehicles will be much less important.

The interim solution to battery range is hybrid vehicles that can run on electricity or conventional fuels. Plug-in hybrids have larger battery packs that allow vehicles to travel greater distances under battery power prior to use of the gasoline engine.

Relevant General Plan Policies.

Policy RC-8-j **Alternative Fuel Network.** Support the development of a network of integrated charging and alternate fuel station for both public and private vehicles, and if feasible, open up municipal stations to the public as part of network development.

Key GHG Plan Indicators.

- Completion of EV charging stations and alternative fuel stations

5.1.4 Energy Conservation Strategies for New and Existing Buildings

Improving energy efficiency in new and existing buildings and facilities provides one of the most cost-effective strategies for reducing greenhouse gases. The energy savings from improved energy efficiency can often pay for the cost of the upgrades and retrofits over time. These strategies are implemented through the promotion of energy- and water-efficient buildings (e.g., LEED buildings and/or exceeding Title 24 standards) through green building ordinances, project timing, prioritization, and other implementing tools.

5.1.4.1 Energy Efficiency in New Buildings

New projects can exceed Title 24 Energy Efficiency Standards for new residential and non-residential buildings. The amount of reductions in energy use can be related to voluntary tier levels contained in Title 24 or through use of outside certifying programs such as LEED, EnergyStar or Greenpoint Rating systems. It should be noted that meeting LEED standards does not necessarily mean that a project would comply with Title 24, so additional measures may still be required for some projects to meet regulatory requirements. The state's ultimate goal is for new buildings to achieve "net zero" energy consumption. Net zero requires a combination of high efficiency buildings and energy self-generation through solar power or other means. Once net zero buildings become the norm, opportunities for reductions from new building energy efficiency become limited. Locations and building designs that are not suitable for onsite generation will not be able to achieve net zero energy consumption with currently available technologies. For those sites, offsite generation in common areas or through purchase of energy generated by zero emission facilities may be used.

Relevant General Plan Policies.

Objective RC-8 Reduce the consumption of non-renewable energy resources by requiring and encouraging conservation measures and the use of alternative energy sources.

Policy RC-8-a **Existing Standards and Programs.** Continue existing beneficial energy conservation programs, including adhering to the California Energy Code in new construction and major renovations.

Policy RC-8-b **Energy Reduction Targets**. Strive to reduce per capita residential electricity use to 1,800 kWh per year and nonresidential electricity use to 2,700 kWh per year per capita by developing and implementing incentives, design and operation standards, promoting alternative energy sources, and cost-effective savings.

Policy RC-8-c **Energy Conservation in New Development.** Consider providing an incentive program for new buildings that exceed California Energy Code requirements by fifteen percent.

Policy RC-8-d **Incentives.** Establish an incentive program for residential developers who commit to building all of their homes to ENERGY STAR performance guidelines.

Policy RC-8-e **Energy Use Disclosure.** Promote compliance with State law mandating disclosure of a building's energy data and rating of the previous year to prospective buyers and lessees of the entire building or lenders financing the entire building.

Key GHG Plan Indicators.

- Title 24 compliance reports demonstrating projects meet or exceed regulatory requirements.
- Project CEQA documents include discussion of energy conservation design features.
- Periodic compilation of building energy efficiency reports for comparison with Plan goals.

5.1.4.2 Energy Efficiency in Existing Buildings

Older buildings that were constructed prior to the adoption of Title 24 or that were constructed when early versions of Title 24 were in place provide significant opportunities for cost-effective energy retrofits. Most current energy retrofit programs are voluntary incentive based programs. The State of California and the federal government have from time to time offered tax credits and deductions for energy retrofits. Public utilities also offer energy efficiency rebates for projects such as whole-house fans, insulation, weatherization, and other actions that reduce energy consumption in residential and commercial buildings. Some jurisdictions have proposed mandatory energy efficiency retrofits at time of sale; however, those programs are currently considered by many to be infeasible because of the loss of equity experienced by many homeowners at the time of sale, especially when housing values are low.

In January 2011, the City Council unanimously approved the adoption of the California Property Assessed Clean Energy (PACE) program administered by figtreecompany.com for the City of Fresno.

PACE utilizes bond financing to provide property owners fixed-rate, property-based, no-money-down financing for energy and water efficiency retrofits to their properties, significantly reducing energy bills and expenses with instant cost savings. The City no longer has an active PACE program; however, in partnership with PG&E, the City has implemented programs to achieve reductions in electricity usage, particularly in the municipal sector.

Relevant General Plan Policies.

Policy RC-7-i **PACE Financing.** Develop a residential Property Assessed Clean Energy (PACE) program, if it is determined to be a feasible option, to help finance water efficiency and energy efficiency upgrades for property owners.

Key GHG Plan Indicators.

- Progress in implementing the PACE program.
- Report on types and numbers of projects funded.

5.1.4.3 Self-Generation Using Solar Panels and Solar Hot Water Systems

The city of Fresno's location and climate is excellent for solar electric generation and hot water systems with an average of 262 sunny days per year. Residential and commercial projects can include solar-ready roofs to allow future installation of solar panels or provide solar panels at the time of construction. Solar panel technology is becoming increasingly efficient in terms of power production and costs have declined substantially in recent years. Not all locations and project settings are conducive to solar power production, and cost-effectiveness is currently dependent on the receipt of incentives in most cases. Sites with the potential for other structures or trees shading the panel location greatly reduce feasibility. The projects also often require net metering where surplus power generated by the panels is sold to the utility and power is purchased from the grid during periods of low production or high usage. The utilities are only required to accept a limited amount of solar photovoltaic (PV) distributed generation into their systems each year. If limits are exceeded and net metering is not allowed, the systems become less feasible.

Solar hot water systems have been used for residential water heating for many years and are especially popular for residences with swimming pools to extend the days per year when the pool can be used. Another option for hot water is to use tankless, electric water heaters. These are increasingly used in new development. Tankless heating saves water and energy because it is not necessary to run the water for long periods for the water to arrive from the hot water tank to the faucet as is the case with the conventional water heaters.

Relevant General Plan Policies.

Policy RC-8-h **Solar Assistance.** Identify and publicize information about financial mechanisms for private solar installations and provide over-the-counter permitting for solar installations meeting specified standards, which may include maximum size (in kV) of units that can be so approved.

Key GHG Plan Indicators.

- Projects permitted

5.1.5 Water Conservation Strategies

Northeast Fresno Surface Water Treatment Plant

Water pumping and transport consumes approximately 20 percent of all energy used in California. Measures to reduce water consumption through improved efficiency in plumbing fixtures and landscaping can result in substantial savings compared to past practices. In some cases, it may be feasible to go beyond the water efficiency standards in the California Green Building Standards Code and the State Model Water Efficient Landscape Ordinance with new construction. Water reuse and recycling through non-potable "purple pipe" systems may reduce energy consumption for water transport. The City has started installing purple pipes through implementation of the Recycled Water Ordinance. The Ordinance requires that new developments within planned major recycled water distribution mains to install purple pipe. As the City's capital projects construct distribution infrastructure, these segments will be in place to facilitate connections to new customers. The City's initial implementation of the recycled water distribution system from the Recycled Water Reclamation Facility is currently under construction. The City plans to use 25,000 acre-feet per year of recycled water to irrigate open spaces, parks, street medians, and golf courses, and at groundwater recharge facilities. The City is constructing an advanced treatment facility at the Fresno-Clovis Regional Water Reclamation Facility (RWRF) to process and clean the water to meet State and federal standards and regulations for non-potable use. The initial capacity of the facility will be 5 million gallons per day with a future capacity of 30 million gallons per day. The new treatment facility will pump water into the new network of recycled water pipelines that will convey recycled water across the city. The route begins in a rural and agricultural area in Fresno county and moves to high traffic city streets. High traffic volumes, businesses, agriculture, cemeteries and residences are immediately adjacent to project route (Recharge Fresno 2018).

The use of recycled water focuses on new and existing large green spaces, industrial uses, and new development. However, the development of a gray water policy for the residential reuse of wastewater for household gardening and landscape irrigation on site may be feasible. Water users that implement these measures or purchase buildings and homes that include these features will benefit from savings in their water bills.

5.1.5.1 Relevant General Plan Policies

Policy RC-6-d **Recycled Water.** Prepare, adopt, and implement a City of Fresno Recycled Water Master Plan.

Objective RC-7 Promote water conservation through standards, incentives and capital investments.

Policy RC-7-a **Water Conservation Program Target.** Maintain a comprehensive conservation program that reduces per capita water usage in the city's water service area to 243 gallons per capita per day (gpcd) by 2020 and 190 gpcd by 2035, by adopting conservation standards and implementing a program of incentives, design and operation standards, and user fees.

- Support programs that result in decreased water demand, such as landscaping standards that require drought-tolerant plants, rebates for water conserving devices and systems, turf replacement, xeriscape landscape for new homes, irrigation controllers, commercial/industrial/ institutional water conserving programs, prioritized leak detection program, complete water system audit, landscape water audit and budget program, and retrofit upon resale ordinance.
- Implement the U.S. Bureau of Reclamation Best Management Practices for water conservation as necessary to maintain the City's surface water entitlements.
- Adopt and implement policies in the event an artificial lake is proposed for development.
- Work cooperatively toward effective uniform water conservation measures that would apply throughout the Planning Area.
- Expand efforts to educate the public about water supply issues and water conservation techniques.

Policy RC-7-d **Update Standards for New Development.** Continue to refine water saving and conservation standards for new development.

Policy RC-7-f **Implementation and Update Conservation Program.** Continue to implement the City of Fresno Water Conservation Program, as may be updated, and periodically update restrictions on water uses, such as lawn and landscape watering and the filling of fountains and swimming pools, and penalties for violations. Evaluate the feasibility of a 2035 conservation target of 190 gpcd in the next comprehensive update of the City of Fresno Water Conservation Program.

Policy RC-7-h **Landscape Water Conservation Standards.** Refine landscape water conservation standards that will apply to new development installed landscapes, building on the State Model Water Efficient Landscape Ordinance and other State regulations.

- Evaluate and apply, as appropriate, augmented xeriscape, "water-wise," and "green gardening" practices to be implemented in public and private landscaping design and maintenance.

- Facilitate implementation of the State's Water Efficient Landscape Ordinance by developing alternative compliance measures that are easy to understand and observe.

Key GHG Plan Indicators.

- Track per capita water use with collected meter data and normal reporting.
- Progress in updating the Water Conservation Program.

5.1.6 Waste Diversion and Recycling and Energy Recovery

Programs and actions that promote recycling and diversion of waste from landfills can reduce energy consumed in the transport and handling of the waste material and can reduce the greenhouse gases that are emitted during the decomposition of organic waste.

The State of California has adopted increasingly stringent mandates for the percentage of solid waste that can be disposed in landfills. Programs that require or encourage further reductions in waste beyond mandates will result in greenhouse gas reductions from this source. Certain landfills are mandated to install methane capture systems. Methane is a powerful greenhouse gas that is 21 times more effective than carbon dioxide in retaining heat in the atmosphere. The methane can be flared, producing mainly carbon dioxide or used in combustion devices to generate heat or power that can be used for productive purposes displacing the use of fossil fuels.

Relevant General Plan Policies.

Policy PU-9-a **New Techniques.** Continue to collaborate affected stakeholders and partners to identify and support programs and new techniques of solid waste disposal, such as recycling, composting, waste to energy technology, and waste separation, to reduce the volume and toxicity of solid wastes that must be sent to landfill facilities.

Policy PU-9-b **Compliance with State Law.** Continue to pursue programs to maintain conformance with the Solid Waste Management Act of 1989 or as otherwise required by law and mandated diversion goals.

Policy RC-11-a **Waste Reduction Strategies**. Maintain current targets for recycling and re-use of all types of waste material in the city and enhance waste and wastewater management practices to reduce natural resource consumption, including the following measures:

- Continue to require recyclable material collection and storage areas in all residential development.

- Establish recycling collection and storage area standards for commercial and industrial facilities to size the recycling areas according to the anticipated types and amounts of recyclable material generated.
- Provide educational materials to residents on how and what to recycle and how to dispose of hazardous waste.
- Provide recycling canisters and collection in public areas where trash cans are also provided.
- Institute a program to evaluate major waste generators and identify recycling opportunities for their facilities and operations.
- Continue to partner with the California Integrated Waste Management Board on waste diversion and recycling programs and the CalMax (California Materials Exchange) program.
- Evaluate the feasibility of a residential, restaurant and institutional food waste segregation and recycling program, to reduce the amount of organic material sent to landfill and minimize the emissions generated by decomposing organic material.
- Evaluate the feasibility of "carbon footprinting" for the City's wastewater treatment facilities, biomass and composting operations, solid waste collection and recycling programs.
- Expand yard waste collection to divert compostable waste from landfills.
- Study the feasibility and cost-benefit analysis of a municipal composting program to collect and compost food and yard waste, including institutional food and yard waste, using the resulting compost matter for City park and median maintenance.

Policy RC-11-b **Zero Waste Strategy.** Create a strategic and operations plan for fulfilling the City Council resolution committing the City to a Zero Waste goal.

Policy RC-4-i **Methane Capture.** Continue to pursue opportunities to reduce air pollution by using methane gas from the old City landfill and the City's wastewater treatment process.

Key GHG Plan Indicators.

- Progress reports on achieving State mandated waste reduction and diversion goals.
- Adoption of commercial and industrial recycling area and storage standards.
- Adoption of the Zero Waste Strategy.

5.1.6.2 Wastewater

Fresno/Clovis RWRF

Wastewater treatment can produce methane emissions that are a powerful greenhouse gas, but it also provides a valuable renewable energy source when scrubbed of harmful components. Fresno currently operates a major regional secondary treatment plant and reuses water primarily for agricultural purposes. The City has one tertiary treatment facility at the Copper River development in north Fresno that provides water for a golf course and shared landscaped areas. Tertiary treatment of wastewater can allow its use for safely watering landscaped areas such as highway medians, parks, and golf courses using so-called "purple pipe" systems. Tertiary treatment systems can use substantial amounts of energy, so energy savings from less water pumping must be balanced with the energy costs of treating the water and pumping to where it is used. Wastewater treatment plants such as the Fresno/Clovis Regional Wastewater Reclamation Facility (RWRF) with anaerobic digesters capture the methane produced during the treatment process for productive use such as generation of electricity or process heat to offset some of the plant's power consumption.

Relevant General Plan Policies.

Objective PU-7 Promote reduction in wastewater flows and develop facilities for beneficial reuse of reclaimed water and biosolids for management and distribution of treated wastewater.

Policy PU-7-a **Reduce Wastewater.** Identify and consider implementing water conservation standards and other programs and policies, as determined appropriate, to reduce wastewater flows.

Policy PU-7-d **Wastewater Recycling**. Pursue the development of a recycled water system and the expansion of beneficial wastewater recycling opportunities, including a timely technical, practicable, and institutional evaluation of treatment, facility siting, and water exchange elements.

Key GHG Plan Indicators.

- Progress in adopting wastewater reduction programs.
- Feasibility studies regarding future tertiary treatment/recycling options.

5.1.6.3 Community Involvement and Outreach

Many of the strategies listed above will be more effective if there is community involvement and outreach to engage the citizens. This strategy requires public awareness of the measures available for them to take effective action at reducing their energy use and carbon footprint.

Measures and programs that reduce greenhouse gas emissions are often operated at the regional level. Many modes of transportation operate at the regional level, because people travel throughout the region. Regional cooperation provides a venue for sharing knowledge and resources to help address a variety of issues, including climate change and greenhouse gas emissions.

Relevant General Plan Policies.

Policy RC-7-g **Educate on State Requirements.** Educate the residents and businesses of Fresno on the requirements of the California Water Conservation Act of 2009.

Policy RC-8-h **Solar Assistance.** Identify and publicize information about financial mechanisms for private solar installations and provide over-the-counter permitting for solar installations meeting specified standards, which may include maximum size (in kV) of units that can be so approved.

Policy RC-8-k **Energy Efficiency Education.** Provide long-term and ongoing education of homeowners and businesses as to the value of energy efficiency and the need to upgrade existing structures on the regular basis as technology improves and structures age.

Key GHG Plan Indicators.

- Progress reports on education and outreach programs.
- Number of solar panel installation permits issued.

5.1.7 Municipal Strategies

The City of Fresno has a comprehensive set of strategies specifically targeted at greenhouse gas emissions generated at City-owned facilities and from City operations. The strategies identified by the City include the following measures intended to improve energy efficiency in buildings and equipment owned by the City, alternative fuels for City vehicles and equipment, and water conservation:

- Improve energy efficiency in City operations.
- New City buildings exceed Title 24 energy efficiency standards.
- Install renewable energy systems on City facilities.
- City operated transportation demand management for City employees.
- Purchase green vehicles for City fleets.
- Enhance reduction, recycling, and reuse efforts at City facilities.
- Implement water efficient landscaping in city parks and facilities.

Relevant General Plan Policies.

Policy RC-7-c **Best Practices for Conservation.** Require all City facilities and all new private development to follow U.S. Bureau of Reclamation Best Management Practices for water conservation, as warranted and appropriate.

Policy RC-7-e **Retrofit City Facilities, and Consider Incentives Programs to Encourage Retrofitting of Other Existing Public and Private Residential and Non-Residential Facilities and Sites.** Reduce water use in municipal buildings and City operations by developing a schedule and budget for the retrofit of existing municipal buildings with water conservation features, such as auto shut-off faucets and water saving irrigation systems. Prepare a comprehensive incentive program for other existing public and private residential and non-residential buildings and irrigation systems.

Policy RC-8-f **City Heating and Cooling.** Reduce energy use at City facilities by updating heating and cooling equipment and installing "smart lighting" where feasible and economically viable.

Policy RC-8-g **Revolving Energy Fund.** Create a City Energy Fund which uses first year savings and rebates from completed City-owned energy efficiency projects to provide resources for additional energy projects. Dedicate this revolving fund to the sole use of energy efficiency projects that will pay back into the fund.

Key GHG Plan Indicators.

- Progress reports from responsible departments on conservation efforts.
- Progress on creating a City Energy Fund.
- Identification and recognition of major individual conservation projects.

5.1.7.2 Regional Urban Forestry Program

Trees provide shade that can reduce the urban heat island effect caused when pavement and other open surfaces absorb solar radiation and re-radiate heat to the surrounding environment. The shade can reduce energy required for cooling. Trees also store carbon as they grow, in a process referred to as sequestration. Emission reductions from urban forestry projects must consider the life cycle emissions such as tree maintenance and the ultimate disposition of trees at the end of their lives to ensure that they produce a net decrease in greenhouse gas emissions.

The City maintains trees in parks and other publicly owned landscaped areas. These areas may provide an opportunity for new tree planting or replacement of tree species that possess a low potential to store carbon, with tree species that possess higher carbon storage potential. Guidance for managing urban forests is available from a number of sources. The Climate Action Reserve, Urban Forest Project Reporting Protocol (CAR 2019) provides criteria for generating greenhouse gas emission offsets with tree planting along with procedures for project monitoring. ICLEI's Urban Forestry Toolkit for Local Governments provides a series of fact sheets and case studies that communities can use to design an effective urban forestry program (ICLEI 2006).

Relevant General Plan Policies.

Policy POSS-1-g **Regional Urban Forest.** Maintain and implement incrementally, through new development projects, additions to Fresno's regional urban forest to delineate

corridors and the boundaries of urban areas, and to provide tree canopy for bike lanes, sidewalks, parking lots, and trails.

Key GHG Plan Indicators.

- Track change in urban tree cover over time.

5.1.7.3 Other Municipal Strategies

Energy Savings from Traffic and Street Lighting. The City plans to replace lighting fixtures with more efficient LED or other technology whenever possible. According to a report prepared by PG&E, Phase II LED luminaires provided power savings of 36 percent compared with high-pressure sodium luminaires, and the newer Phase III LED luminaires provided 52 percent savings (PG&E 2008).

Low-Emission City Fleet Vehicles. The City operates vehicles used by the FAX bus fleet, the Solid Waste Division, the Police Department and for maintenance and other purposes. The City has already converted all buses to compressed natural gas (CNG). FAX currently operates 110 alternatively fueled CNG buses. In 2014, the CARB approved a regulation setting a Statewide goal for public transit agencies to transition to 100 percent zero-emission bus fleets by 2040, and requiring that all new bus procurements be carbon-free by 2029. FAX's most recent bus order included two Proterra all-electric battery 40-foot buses, anticipated to arrive in mid-2020 with an additional order of seven scheduled for revenue service in 2020. Through these investments, FAX continues to showcase its commitment to cleaner vehicles and a cleaner environment.

Green Purchasing. The City makes purchases typical for city government operations such as vehicles, computers, paper, and materials required to maintain the City's infrastructure. The City's compressed natural gas (CNG) fleet vehicles provide good examples of its past green purchasing practices.

Municipal Water Conservation. The City has implemented water saving measures at most public parks, and other landscaped areas maintained by the City. The General Plan Policies listed in the Water Conservation Strategies section apply to municipally operated facilities.

5.1.8 Strategies for Existing Development

The GHG Plan Update strategies described above are implemented in two ways. New development projects would be constructed consistent with the General Plan and GHG Plan Update. Existing residents and businesses would comply with regulations that apply to everyone and participate in new and existing programs and measures. People living in existing residential development also share the benefits of the land use strategies applied at work places and commercial areas that are walkable and transit oriented. The strategies that apply directly and indirectly to existing development are shown in Table 5-B.

Table 5-B: Strategies for Existing Development

Strategy	How it Applies
Transportation Demand Management (TDM)	TDM is implemented at existing and new businesses and can also reduce trips from new and existing housing where employees live.
Expanded Transit Service	Improved transit service will encourage increased ridership from new and existing development.
Improved Connections to Transit Stations	Transit stations service a wider community area that includes connections to new and existing development through sidewalks and bike lanes.
Traffic Calming Retrofits	Traffic calming designs can be retrofitted on existing roads or built in new development.
Complete Streets Program	Complete streets connect existing and new areas.
Parking Management	Parking management at new and existing employment centers encourages trip reductions from all residential development
Energy Retrofits	Educational and incentive programs encourage existing residents and business owners to install energy retrofits providing large benefits in older structures.
Bicycle and Pedestrian Improvements on Existing Roads and near transit stations	Bicycle paths and lanes can be retrofitted on existing roads, near transit stations. Sidewalks and pedestrian paths can connect existing neighborhoods with appropriate destinations including transit stations.
Bicycle Parking Facilities	Bicycle parking can be added to existing businesses if needed to satisfy demand by employees and customers.
Water Conservation Programs	Educational and incentive programs encourage existing residents and businesses to conserve water.
Recycled Water Use in Existing Parks	Recycled water can be piped to any area retrofitted or initially developed with a “purple pipe” system to distribute recycled water.
Energy Retrofits	Educational and incentive programs encourage existing residents and business owners to install energy retrofits providing large benefits in older structures.
Bicycle Parking Facilities	Bicycle parking can be added to existing businesses if needed to satisfy demand by employees and customers.
Recycling Programs	Operational programs such as recycling apply to all residents and businesses in the city.
Electric Vehicle Charging	Charging stations can be installed in existing development as a retrofit or in new development.
Measures That Apply to New Development but Indirectly Benefit Existing Development	
Transit and Pedestrian Oriented Development	Transit and pedestrian oriented development provides destinations that encourage transit use from existing development and walking once people arrive.
Mixed Use Development	Mixed-use development creates a more walkable environment conducive to transit use for trips from existing development.
Compact Development	Making the city more compact shortens average trip lengths for residents and creates more opportunities for transit.
Traffic Flow Improvements	Transportation improvements that reduce congestion and improve flow can reduce emissions from both existing and new development.
Recycling Programs	Operational programs such as recycling apply to all residents and businesses in the city.
Electric Vehicle Charging	Charging stations can be installed in existing development as a retrofit or in new development.

5.2 REDUCTION POTENTIAL FROM LOCAL MEASURES

Reductions beyond State regulations will be achieved through the development of the land use pattern and transportation system envisioned by the General Plan, enforcement of City ordinances and design standards, and direct reductions from energy conservation projects, and alternative fuels use.

The effectiveness of the GHG land use strategy is dependent on several factors. The first factor is the rate of population growth. Rapid population growth has two contradictory effects. First, the overall growth in emissions will increase substantially in high growth areas; however, the per capita emissions in high growth areas will be lower. This is because a larger percentage of the population will live in areas of the city with energy efficient homes and businesses, and better transportation options than the slow growing or built out counterparts. On a citywide basis, faster-growing cities will build out neighborhoods and shopping centers more rapidly, providing more work and shopping opportunities close to home and shorter travel distances.

The second factor is economic. The type and scale of development projects will vary depending on market forces and the state of the economy in future years. Market forces affect the amount of single-family development compared to multi-family development. A vibrant economy will tend to create more jobs and increase in migration.

The amount of trips and miles traveled varies substantially between highly urban areas and suburban and rural areas. Frequent bus, light rail, or commuter train service requires high development densities to provide adequate ridership to support the service. The reductions that can be achieved by pedestrian orientated development and transit oriented development vary widely based the density and design at both ends of the trip.

5.2.1 Mobile Source Reductions

5.2.1.1 Land Use Strategy

SB 375 required the CARB to set regional targets for reductions from light duty passenger vehicle emission. After a lengthy review process and input from the regional transportation planning agencies, the CARB adopted a Fresno County target reduction in passenger vehicle CO_2e per capita of 4.7 percent by 2020 and 7.6 percent by 2035. The key strategies envisioned include:

- Combination of density increase, mixed uses, and infill
- Growth along major transit corridors and activity centers

The land use strategies are expected to reduce trip generation and vehicle miles traveled to achieve the percentage reductions based on modeling results from the regional transportation model for the General Plan land use scenario. The City of Fresno is participating in the SB 375 SCS process to more closely define the growth areas that would be part of the SCS and qualify for CEQA streamlining provisions.

Emission reductions at the individual project level would be substantially larger than the amounts estimated for as the overall reduction for SB 375 compliance. CAPCOA estimates that land use and

transportation measures in a suburban setting can reduce emissions by a global maximum of 15 percent and 20 percent in a suburban center. Projects approaching the maximum reductions would be in locations served by frequent transit with complete pedestrian and bicycle infrastructure and multiple destinations such as retail and commercial service within walking distance.

5.2.1.2 Transportation Demand Management

The General Plan encourages transportation demand management (TDM) at projects that are large employers. The SJVAPCD Rule 9410 – Employer Trip Reduction would provide at 1.6 percent emission reduction in 2020 and 2035 through reduced trips and vehicle miles traveled.

The land use strategy and transportation demand management would provide a combined 45,184 MT CO_2e/year in emission reductions by 2020, a 66,191 MT CO_2e/year reduction by 2030, and a 80,114 MT CO_2e/year reduction by 2035. The assumptions used for these calculations are based on the 2014 GHG Plan with the adoption of General Plan land use strategy and compliance with SJVAPCD Rule 9410.

5.2.1.3 Implement Support for Electric Vehicles

Hybrid EVs, plug-in hybrid EVs, and all-EVs produce lower emissions than conventional vehicles. Any type of electrified vehicle emits less GHG than conventional vehicles by at least 40 percent. The City could promote EVs by establishing EV incentive programs, installing EV chargers within residential units and commercial building parking lots and providing streamlined permitting ordinance for EV charging stations. Based upon the historic trends in EV ownership and the CARB Zero-Emission Vehicles (ZEV) Action Plan, it is assumed that by 2030 EV ownership in the city would reach 8.7 percent, and by 2035, 13 percent of the vehicle trips would be made by EVs.

CALGreen, the State green building code (California Code of Regulations [CCR], Title 24, Part 11), sets requirements for installing EV-capable infrastructure in new residential and nonresidential buildings. CALGreen contains minimum requirements that apply statewide as well as reach codes that can be adopted by local governments. Starting January 1, 2020, CALGreen requires that new construction of single-family residences, duplexes, and townhouses with private garages must have raceway and panel capacity to support the future installation of level 2 charging stations (CEC 2019, ICC 2019). The City supports increased EVs within the city by encouraging the installation of EV chargers within new and existing multi-family residential and commercial parking areas within the city.

5.2.1.4 Implementation Support for Zero Emission Buses

To implement the State of California's Innovative Clean Transit regulation[10] of 100 percent zero-emission buses by 2040 (CARB 2019), FAX needs regulatory and financial support to determine the

[10] To transition successfully to an all zero-emission bus fleet by 2040, each transit agency will submit a rollout plan under the regulation demonstrating how it plans to purchase clean buses, build out necessary infrastructure and train the required workforce. The rollout plans are due in 2020 for large transit agencies and in 2023 for small agencies. Agencies will then follow a phased schedule from 2023 until 2029, by which date 100 percent of annual new bus purchases will be zero-emission.

most viable options for transitioning its fleet to zero emission buses (ZEBs). FAX should consider potential funding mechanisms for this program. Some potential strategies are as follows:

- Traditional financing methods, such as municipal bonds and local option transportation taxes to finance the purchase and/or operation of new ZEBs.
- Collaboration with local utilities to obtain beneficial rate structures to reduce charging costs and work with utilities to secure charging infrastructure investments.
- Federal, State, regional, and local grant and incentive programs to reduce the initial purchase price of ZEBs.

In addition to funding, building the infrastructure necessary to deploy the ZEBs, and procuring electricity, hydrogen, or other alternative fuel sources to operate them pose challenges for FAX that will require innovative approaches and best practices to operate a full fleet of ZEBs in the City by 2040. FAX is currently working on its rollout plan to meet all requirements by 2040.

5.2.2 Energy Efficiency Reductions

5.2.2.1 Building Energy Efficiency

The City supports the State's efforts to achieve net zero energy consumption in new residential and non-residential buildings. Achieving net zero is currently possible in some buildings with the use of onsite solar to offset the electricity consumption from the grid. The 2019 Title 24 standards that will go into effect in January 2020 are substantially more stringent than the 2016 Title 24 standards and focus on achieving zero net energy homes.

The City encourages developers to achieve the voluntary tier levels from the CPUC Energy Efficiency Strategic Plan, which ultimately lead to net zero energy consumption for residential development by 2020 and non-residential development by 2030. GHG emission reductions from net zero energy homes have been accounted for under State regulations in Chapter 4 as the 2019 Title 24 standards include this requirement. By achieving net zero energy consumption for non-residential development by 2030, the City would reduce GHG emissions by 70,230 MT CO_2e/year by 2030, and 100,237 MT CO_2e/year by 2035. Once Title 24 mandates net zero energy consumption, no further reductions beyond regulation can be achieved by projects.

5.2.3 Water Conservation

The California Water Conservation Act mandates a 20 percent reduction in water usage by 2020. The City has a reduction target of per capita water usage in the City's water service area to 230 gallons per day per capita (25 percent below the current consumption rate) in 2035. The City will meet the reduction target with measures applicable to new and existing development. Reductions beyond the state mandated 20 percent are possible with the use of building and landscaping water conservation features. The reductions from buildings can be achieved with high-efficiency toilets, low-flow showers and faucets, and water-efficient appliances such as clothes washers and dishwashers. Water savings from landscaping would be achieved primarily through the use of synthetic ('turf') lawns, drought-tolerant landscaping or xeriscaping. The City is also proposing

General Plan Policy RC-7-b that requires a tiered water cost structure to cover the true cost of the water supply. Example measures and water savings estimates are provided below.

Indoor Water Conservation Measures.

- **Hot Water Pipe Insulation:** Insulate hot-water pipes, and separation of hot and cold piping to avoid heat exchange. Water savings: 2,400 gallons per residential unit per year. Cost: $50/unit.

- **Pressure Reducing Valves.** Pressure reducing valves maintain pressure below 60 psi reducing volume of any leakage present and preventing excessive flow from all appliances and fixtures. Water savings: 30,000 gallons approximately per residential unit per year. Cost: $100-$150 per unit[11].

- **Water-Efficient Dishwashers.** Install Energy Star-certified units. Water savings: 5000 gallons per residential unit per year[12].

- **Dual Flush Toilets:** Provides option to flush with partial (0.8 gallon) flow of water or with a full (1.6 gallons) flow depending on need. Water savings: 13,000 gallons per year per toilet[13]. Cost: $200 per toilet; however, retrofit kits are available for under $20.

- **High-Efficiency Washing Machines:** Use front loading and top loading Energy Star-qualified clothes washers that use 35 to 50 percent less water than conventional washing machines. Water savings: 7,000 gallons per year[14]. Cost: $800 for a high-efficiency washing machine.

- **Point-of-Use or Tankless Water Heaters:** Install small water heaters close to the point of use, such as bathrooms, kitchen, and laundry area. Water savings: 5,300 gallons per residential unit per year[15]. Cost: $700 for point of use water heaters. However, the cost is approximately the same for one large unit or three smaller ones.

Outdoor Water Conservation Measures.

- **Evapotranspiration (ET) Controllers:** Irrigation scheduled by actual plant ET rates. Water savings: 20,000 gallons per single-family unit per year. Cost: $175 per controller and $48 per year in maintenance.

15 Energy Star Point of Contact Heaters. Website: www.energystar.gov/products/water_heaters/point_use_pou_water_heaters (accessed August 10, 2019).

- **Water-Efficient Landscaping:** Use drought tolerant plants and compliant irrigation systems and controllers. Water Savings: Up to 50 percent of outdoor use (12,000 gallons/year from a 2,100-square foot landscaped area. Cost: similar to conventional landscaping.

- **Xeriscape:** Xeriscaping is a combination of seven principles, planning and design, practical turf areas, efficient irrigation, soil analysis and improvement, mulching, low-water-use plants, and appropriate maintenance. Water savings: 30 percent reduction in irrigation demand or about 16,000 gallons per year on a typical single-family lot. Cost: similar to conventional landscaping.

Estimates of water savings and costs are from the City of Chula Vista Water Conservation Plan Guidelines adopted in 2003.

5.2.3.2 Energy Savings from Water Conservation

The combined benefits of indoor and outdoor water conservation program are estimated at 20 percent in 2020 to achieve compliance with state-mandated reductions and 25 percent by 2035 to meet the General Plan target, which are consistent with the assumptions in 2014 GHG Plan. Reductions in water use reduce electricity consumed for pumping, treatment, and transport of water by proportional amounts. Reductions in water use by these amounts would provide emission reductions of 5,975 MT CO_2e/year by 2020 and 8,891 MT CO_2e/year by 2035. Assuming a constant reduction rate, the emission reductions in 2030 would be 7,840 MT CO_2e/year.

5.2.4 Waste Diversion and Recycling Reductions

The City of Fresno will meet or exceed the state-mandated 75 percent diversion target in the future. The CARB estimates that statewide reductions of 20 to 30 MMT CO_2e will be achieved through this strategy. The City of Fresno has achieved substantial progress to date. The city per capita baseline based on the 2002 to 2004 average is 6.6 pounds per day per person. The 2018 per capita rate was 4.8 pounds per day per person, which was assumed to be consistent through 2020. The 75 percent diversion target would require a per capita rate of 1.65 pounds per person per day. Achieving net zero waste would provide additional reductions from this sector; however, no reductions are estimated pending adoption of a state mandate. The estimated emission reductions from achieving the 75 percent mandated diversion target are 84,677 MT CO_2e/year in 2030, and 90,043 MT CO_2e/year in 2035.

5.2.5 Summary of Reductions from Local Measures

Table 5-C summarizes the local reductions from the measures described above.

Table 5-D summarizes the baseline 2010 and updated 2016 GHG emissions, the projected 2020, 2030, and 2035 emission inventories, as well as the reduced 2020, 2030, and 2035 inventories after implementation of the State and local reduction measures.

By 2020, the Statewide and local measures together would reduce the city's GHG emissions from the 2020 BAU level to 2,081,167MT CO_2e, which would exceed the 15 percent below baseline levels reduction target of 3,183,348 MT CO_2e for 2020. By 2030, the Statewide and local measures together would reduce emissions to 1,710,386 MT CO_2e, which would exceed the 49 percent below

Table 5-C: Emissions Reductions from Local Measures

Sector	Local Measures	Emissions Reductions (MT CO_2e/year)		
		2020	2030	2035
Transportation	Land Use Strategy and Transportation Demand Management	45,184	66,191	80,114
Commercial Energy	Net Zero Energy Commercial Building	-	70,230	100,237
Industrial Energy (Water)	Water Conservation	5,975	7,840	8,981
Solid Waste	Waste Diversion and Recycling	-	84,677	90,043
	Total	**51,159**	**228,938**	**279,375**

Source: Compiled by LSA Associates, Inc. (2019).

Table 5-D: GHG Emissions and Targets Comparison

	2010 (MT CO_2e)[1]	2016 (MT CO_2e)	2020 (MT CO_2e)	2030 (MT CO_2e)	2035 (MT CO_2e)
BAU Emissions	3,745,115	2,923,633	3,092,486	3,500,204	3,697,738
State Reductions	-	-	*960,160*	*1,560,880*	*1,896,602*
ABAU Emissions	3,745,115	2,923,633	2,132,326	1,939,325	1,801,137
Local Measures Reductions	-	-	*51,159*	*228,938*	*279,375*
Total Adjusted Emissions	-	-	2,081,167	1,710,386	1,521,761
Reduction Target	-	-	3,183,348	1,910,009	1,591,674
Additional Reductions Needed	-	-	Target Met	Target Met	Target Met

Source: Compiled by LSA Associates, Inc. (2019).

[1] Baseline (2010) emissions are from the City's 2014 GHG Reduction Plan.

GHG = greenhouse gas
ABAU = Adjusted Business-as-Usual
BAU = Business-as-Usual
MT CO_2e = metric tons of carbon dioxide equivalent

baseline levels reduction target of 1,910,009 MT CO_2e for 2030. In 2035, implementation of Statewide and local measures together would reduce emissions from the 2035 BAU level to 1,521,761 MT CO_2e, which would exceed the 58 percent below baseline levels reduction target of 1,591,674 MT CO_2e for 2035.

6.0 DEVELOPMENT PROJECT REQUIREMENTS

This section describes the actions that individual development projects would be required to implement in order to qualify for California Environmental Quality Act (CEQA streamlining) and to demonstrate that the project would not result in significant GHG impacts. Projects that have completed all environmental review prior to adoption of the GHG Plan Update must comply with regulations in effect at the time of construction and with conditions of approval that were required during review of the tract map, development permit, or conditional use permit approved by the City. This means that all development will help meet the City's GHG reduction targets.

6.1 PROJECTS EXEMPT FROM CEQA

Projects that have already completed the CEQA process and only require building permits have no requirements beyond applicable regulations such as the California Building Code, Title 24 Energy Efficiency Standards, the City Development Code, and other City Ordinances.

6.1.1 City Development Code

Consult the Development Code for requirements for each type of project. Examples include:

- Street Design (complete streets and bus stops) (applies if project involves street improvements)
- Pedestrian Improvements (sidewalks, paths, connections, etc.)
- Bicycle Lanes and Paths (consistent with the Active Transportation Plan)
- Bicycle Parking (Commercial)
- Enforce Building Code Requirements (Green Building Code)

6.1.2 State Regulations

Project buildings must meet the California Energy Code and the California Green Building Standard Code.

6.2 PROJECTS REQUIRING A DISCRETIONARY APPROVAL

Projects requiring a discretionary approval from the City must comply with CEQA provisions related to GHG emissions. Projects that are consistent with the GHG Plan Update by demonstrating consistency with the GHG Plan Update Consistency Checklist (checklist) are considered CEQA-compliant for GHG impacts. The following review process is proposed:

6.2.1 New Discretionary Development Approval Process to Determine Consistency with GHG Reduction Plan Update

1. Review the GHG Reduction Plan Project Update CEQA Consistency Checklist (Appendix B) that lists the local GHG reduction strategies identified in the GHG Plan Update to determine applicability to the project.

2. Incorporate design features or mitigation measures into the project as needed to demonstrate consistency.

3. Implement project design features suitable for the development type and location.

Proposed development projects that are consistent with the GHG Plan Update as determined through the use GHG Plan Update CEQA Consistency Checklist may rely on the GHG Plan Update for the cumulative impacts analysis of GHG emissions. Projects that are not consistent with the GHG Plan Update must prepare a comprehensive project-specific analysis of GHG emissions, including quantification of existing and projected GHG emissions and apply appropriate GHG reduction mitigation measures based on the GHG reduction strategies identified in the GHG Plan Update and listed in the checklist.

6.2.2 New Discretionary Development requiring a General Plan Amendment

1. Comply with all of the applicable measures listed above for ministerial and discretionary projects.

2. Ensure that change in land use designation would not result in a significant increase in GHG emissions compared to the existing designation (would require a GHG technical study to quantify GHG emissions and benefits of project design features).

3. Projects currently designated for residential or commercial development that increase development densities and intensities and comply with the relevant GHG reduction strategies in the General Plan, or provide quantified GHG emission reduction calculations which demonstrates that the project would mitigate the cumulative GHG emissions, are considered to have a less than significant GHG impact.

4. Emissions from stationary sources for new industrial projects are not considered in the significance determination; however, emissions from motor vehicles trips generated by the project and energy efficiency of the building are considered.

5. Projects that propose decreases in development densities or intensities requiring a General Plan amendment will require analysis of GHG emissions to determine the impacts on the General Plan land use strategy and must identify mitigation measures to reduce greenhouse gas emissions beyond those required by regulation if needed.

This page intentionally left blank

7.0 GHG PLAN UPDATE IMPLEMENTATION MONITORING

This chapter describes the steps for implementing the GHG Plan Update to support achievement of GHG reduction goals for the community at large. Success in meeting the City's GHG emission reduction goals will depend on cooperation, innovation, and participation by the City, residents, businesses, and local government entities. This section outlines key steps that the City could follow for the implementation of this GHG Plan Update. The GHG Plan Update is designed so that it can be monitored, updated, and its effectiveness measured on an annual basis towards meeting a target for reduction of greenhouse gas emissions in 2020 and 2030 to measure further progress through horizon of the General Plan in 2035. The reporting required for the General Plan provides a good venue for monitoring the GHG Plan. California Government Code Section 65400 requires the City to prepare and submit an annual report on the status of the General Plan and progress in its implementation to the City Council, the Governor's Office of Planning and Research, and the Department of Housing and Community Development. This section provides a guide the City could use to implement the GHG Plan.

7.1 GHG PLAN UPDATE IMPLEMENTATION

Successful implementation of the GHG Plan Update will require implementation and monitoring which could incorporate the following components, which are described in more detail in the sections below:

- Administration and staffing;
- Financing and budgeting;
- Timelines for GHG reduction strategies implementation;
- Community outreach and education; and
- Monitoring, reporting, and adaptive management.

These are basic steps that any City might take or that other California communities have taken to implement a GHG reduction plan. These are suggested—not required—and are intended to guide a City in its implementation planning.

7.1.1 Administration and Staffing

Implementation of the GHG Plan Update will involve coordination with other regional agencies. The City may designate staff to oversee the successful implementation and the tracking of all selected GHG reduction strategies. The City could coordinate with contacts across departments to gather data, to report on progress, to track completed projects, and to ensure that scheduling and funding of upcoming projects is discussed at key City meetings. The City may identify one or more staff to act as the Plan Implementation Administrator(s) to guide monitoring, reporting, and dissemination of information to the public. Where possible, the City may use assistants from programs such as CivicSpark, an AmeriCorps program designed to build capacity for local governments to address climate change.

The Administrator could have the following responsibilities:

- Serve as the external communication hub to local and regional agencies in coordinating the implementation of the GHG Reduction Plan
- Investigate methods to use existing resources and harness community support to better streamline implementation of the Plan
- Monitor implementation of reduction strategies and success of the GHG Plan Update
- Establish guidelines for reporting and documenting emission-reduction progress.
- Track State and federal legislation and its applicability to the City

In general, the goal in implementing the GHG Plan Update is not to create new administrative tasks or new staff positions necessarily, but rather to leverage existing programs and staff to the maximum extent feasible. Cities may seek to fold GHG planning and long-term reduction into their existing procedures, institutional organization, reporting, and long-term planning.

7.1.2 Financing and Budgeting

Implementation of the local GHG reduction strategies may require investment for the capital improvements and other investments, and increased operations and maintenance costs. However, in some cases operating costs are anticipated to decrease, resulting in offset savings. Table C-1 in Appendix C, Potential Funding Sources to Support GHG Reduction Strategies, presents a summary of potential funding and financing options available at the time of writing this document. Some funding sources are not necessarily directed towards a city, but to a larger regional agency such as the SJVAPCD. The City could monitor private and public funding sources for new grant and rebate opportunities and to better understand how larger agencies are accessing funds that can be used for GHG reductions in their areas. Leveraging financing sources is one of the most important roles a local government can play in helping the community to implement many of the GHG reduction strategies. A study commissioned by the City,[16] Energize Fresno Funding Market Study, March 2017, provides a detailed analysis of potential funding mechanisms that could also support the implementation of the GHG reduction strategies identified in the GHG Plan Update.

7.1.3 Timelines for GHG reduction strategies Implementation

After taking into account the reductions in energy and water usage and the GHG emissions resulting from statewide measures, presently it would appear that without future State action the City would need to implement the local reduction strategies to reach its reduction targets for 2035. The City could prioritize the implementation of GHG reduction strategies based on following criteria:

- Cost effectiveness
- GHG reduction efficiency
- Availability of funding
- Level of City Control

[16] Energize Fresno Funding Market Study. 2017. Website: www.lgc.org/wordpress/wp-content/uploads/2018/02/Energize-Fresno-Funding-Market-Study.pdf (accessed August 14, 2019).

- Ease of implementation
- Time to implement

To encourage implementation of all reduction strategies, City staff could develop a GHG Plan Update Implementation Timeline. GHG reduction Strategy prioritization could be based on the factors shown in Appendix C.

7.2 MONITORING THE GHG PLAN UPDATE

Regular monitoring is important to ensure programs function as they were originally intended. Early identification of effective strategies and potential issues would enable the City to make informed decisions on future priorities, funding, and scheduling. Moreover, monitoring provides concrete data to document the City's progress in reducing GHG emissions. The City would be responsible for developing a protocol for monitoring the effectiveness of emission reduction programs as well as for undertaking emission inventory updates. Below are some of the key components of a GHG Plan monitoring program.

- **Update GHG Inventory:** The City could update the inventory emissions prior to 2030 to ensure they meet their GHG reduction goals. This includes regular data collection in each of the primary inventory sectors (utility, regional VMT, waste, wastewater, and water), and comparing the inventory to the City's baseline GHG emissions in 2010 and 2016. The City would consolidate information in a database or spreadsheet that could be used to evaluate the effectiveness of individual reduction strategies.

- **Track State Progress:** The GHG Plan Update relies heavily on Statewide measures. The City should track the State's progress on implementing Statewide programs. Close monitoring of the reductions achieved by State programs would allow the City to adjust its GHG Plan Update, if needed.

- **Track Completion of GHG Reduction Strategies:** The City could keep track of strategies implemented as scheduled in the GHG Plan Update, including progress reports on each strategy, funding, and savings. This would allow at least a rough attribution of gains when combined with regular GHG inventory updates.

- **Regular Progress Reports:** The City may report on the GHG Plan Update implementation progress annually to the City Council as a part of the annual report on progress in implementing General Plan. If annual reports, periodic inventories, or other information indicates that the GHG reduction strategies are not as effective as originally anticipated, the GHG Plan Update may need to be adjusted, amended, or supplemented.

7.3 GHG PLAN UPDATE TRACKING TOOL

The City GHG Plan Update Project Consistency Checklist (checklist) (Appendix B), provides a platform and framework to track the GHG reduction strategy implementation. The City could compile the data obtained from the checklist annually to monitor and track the progress on GHG reductions

achieved through the implementation of the GHG reduction strategies identified in the GHG Plan Update.

The City is currently using an online Accela-based system to track permit applications for development projects. This permit tracking system could be transformed into a GHG reduction monitoring tool, where the City would be able to track GHG reductions achieved through implementation of the GHG reduction strategies within the GHG Plan Update. This would help the City to monitor the GHG Plan Update's implementation progress without added administrative burden, and to share findings with stakeholders, partners, and the community.

APPENDIX A

GENERAL PLAN POLICY LIST

The General Plan is the foundation of the City of Fresno's strategy to reduce development related greenhouse gas emissions. The City's land use authority provides its most effective means of limiting the impact of growth predicted for the City. The Greenhouse Gas Reduction Plan (GHG Plan) relates the benefits of the General Plan and the City's strategy for achieving greenhouse gas (GHG) reduction targets. Table A-1 is a list of General Plan Policies that provide GHG reductions or support GHG Reduction Plan Update (GHG Plan Update) strategies.

Table A-1: General Plan Objectives and Policies

Urban Form Element	
Policy UF-1-c	**Identifiable City Structure.** Focus integrated and ongoing planning efforts to achieve an identifiable city structure, comprised of a concentration of buildings, people, and pedestrian-oriented activity in Downtown; along a small number of transit-oriented, mixed-use corridors and strategically located Activity Centers; and in existing and new neighborhoods augmented with parks and connected by multi-purpose trails and tree lined bike lanes and streets.
Objective UF-12	Locate roughly one-half of future residential development in infill areas — defined as being within the City on December 31, 2012—including the Downtown core area and surrounding neighborhoods, mixed-use centers and transit-oriented development along major BRT corridors, and other non-corridor infill areas, and vacant land.
Policy UF-12-a	**BRT Corridors.** Design land uses and integrate development site plans along BRT corridors, with transit-oriented development that supports transit ridership and convenient pedestrian access to bus stops and BRT station stops.
Policy UF-12-b	**Activity Centers.** Mixed-use designated areas along BRT and/or transit corridors are appropriate for more intensive concentrations of urban uses. Typical uses could include commercial areas; employment centers; schools; compact residential development; religious institutions; parks; and other gathering points where residents may interact, work, and obtain goods and services in the same place.
Policy UF-12-d	**Appropriate Mixed-Use.** Facilitate the development of vertical and horizontal mixed-uses to blend residential, commercial, and public land uses on one or adjacent sites. Ensure land use compatibility between mixed-use districts in Activity Centers and the surrounding residential neighborhoods.
Policy UF-12-e	**Access to Activity Centers.** Promote adoption and implementation of standards supporting pedestrian activities and bicycle linkages from surrounding land uses and neighborhoods into Activity Centers and to transit stops. Provide for priority transit routes and facilities to serve the Activity Centers.
Policy UF-12-f	**Mixed-Use in Activity Centers.** Adopt a new Development Code which includes use regulations and standards to allow for mixed uses and shared parking facilities.
Objective UF-14	Create an urban form to facilitate multi-modal connectivity.
Policy UF-14-a	**Design Guidelines for Walkability.** Develop and use design guidelines and standards for a walkable and pedestrian-scaled environment with a network of streets and connections for pedestrians and bicyclists, as well as transit and autos.
Policy UF-14-b	**Local Street Connectivity.** Design local roadways to connect throughout neighborhoods and large private developments with adjacent major roadways and pathways of existing adjacent development. Create access for pedestrians and bicycles where a local street must dead end or be designed as a cul-de-sac to adjoining uses that provide services, shopping, and connecting pathways for access to the greater community area.

Table A-1: General Plan Objectives and Policies

Urban Form Element (Continued)	
Policy UF-14-c	**Block Length.** Create development standards that provide desired and maximum block lengths in residential, retail, and mixed-use districts order to enhanced walkability.
Land Use Element	
Objective LU-2	Plan for infill development that includes a range of housing types, building forms, and land uses to meet the needs of both current and future residents.
Policy LU-2-a	**Infill Development and Redevelopment.** Promote development of vacant, underdeveloped, and redevelopable land within the City Limits where urban services are available by considering the establishment and implementation of supportive regulations and programs.
Policy LU-2-b	**Infill Development for Affordable Housing.** Establish a priority infill incentive program for residential infill development of existing vacant lots and underutilized sites within the City as a strategy to help to meet the affordable housing needs of the community.
Policy LU-3-b	**Mixed-Use Urban Corridors that Connect the Downtown Planning Area.** Support the development of mixed-use urban corridors that connect the Downtown Planning Area with the greater Fresno-Clovis Metropolitan Area with functional, enduring, and desirable urban qualities along the Blackstone Avenue, Shaw Avenue, California Avenue, and Ventura Avenue/Kings Canyon corridors, as shown on Figure LU-1: General Plan Land Use Diagram.
Policy LU-3-c	**Zoning for High Density on Major BRT Corridors.** Encourage adoption of supportive zoning regulations for compact development along BRT corridors leading to the Downtown Core that will not diminish long-term growth and development potential for Downtown.
Policy LU-5-f	**High Density Residential Uses.** Promote high-density residential uses to support Activity Centers and BRT corridors, and walkable access to transit stops.
Design Element	
Policy D-3-c	**Local Streets as Urban Parkways.** Develop local streets as "urban parkways", where appropriate, with landscaping and pedestrian spaces.
Policy D-4-b	**Incentives for Pedestrian-Oriented Anchor Retail.** Consider adopting and implementing incentives for new pedestrian-friendly anchor retail at intersections within Activity Centers and along corridors to attract retail clientele and maximize foot traffic.
Transportation Element	
Policy MT-1-h	**Update Standards for Complete Streets.** Update the City's Engineering and Street Design Standards to ensure that roadway and streetscape design specifications reflect the Complete Streets concept, while also addressing the needs of through traffic, transit stops, bus turnouts, passenger loading needs, bike lanes, pedestrian accommodation, and short- and long-term parking.
Policy MT-1-i	**Local Street Standards.** Establish and implement local roadway standards addressing characteristics such as alignment, width, continuity and traffic calming, to provide efficient neighborhood circulation; to allow convenient access by residents, visitors, and public service and safety providers; and to promote neighborhood integrity and desired quality of life by limiting intrusive pass-through traffic.
Policy MT-1-j	Transportation Improvements Consistent with Community Character. Prioritize transportation improvements that are consistent with the character of surrounding neighborhoods and supportive of safe, functional and Complete Neighborhoods; minimize negative impacts upon sensitive land uses such as residences, hospitals, schools, natural habitats, open space areas, and historic and cultural resources. In implementing this policy, the City will design improvements to: ● Facilitate provision of multi-modal transportation opportunities; ● Provide added safety, including appropriate traffic calming measures; ● Promote achievement of air quality standards; ● Provide capacity in a cost effective manner; and ● Create improved and equitable access with increased efficiency and connectivity.
Objective MT-4	Establish and maintain a continuous, safe, and easily accessible bikeways system throughout the metropolitan area to reduce vehicle use, improve air quality and the quality of life, and provide public health benefits.
Policy MT-4-a	**Active Transportation Plan.** To the extent consistent with this General Plan, continue to implement and periodically update the Active Transportation Plan to meet State standards and requirements for recommended improvements and funding proposals as determined appropriate and feasible

Table A-1: General Plan Objectives and Policies

Transportation Element (Continued)	
Policy MT-4-b	**Bikeway Improvements.** Establish and implement property development standards to assure that projects adjacent to designated bikeways provide adequate right-of-way and that necessary improvements are constructed to implement the planned bikeway system shown on Figure MT-2 to provide for bikeways, to the extent feasible, when existing roadways are reconstructed; and alternative bikeway alignments or routes where inadequate right-of-way is available
Policy MT-4-c	**Bikeway Linkages.** Provide linkages between bikeways, trails and paths, and other regional networks such as the San Joaquin River Trail and adjacent jurisdiction bicycle systems wherever possible.
Objective MT-5	Establish a well-integrated network of pedestrian facilities to accommodate safe, convenient, practical, and inviting travel by walking, including for those with physical mobility and vision impairments.
Policy MT-5-a	**Sidewalk Development.** Pursue funding and implement standards for development of sidewalks on public streets, with priority given to meeting the needs of persons with physical and vision limitations; providing safe routes to school; completing pedestrian improvements in established neighborhoods with lower vehicle ownership rates; or providing pedestrian access to public transportation routes.
Policy MT-5-e	**Traffic Management in Established Neighborhoods.** Establish acceptable design and improvement standards and provide traffic planning assistance to established neighborhoods to identify practical traffic management and calming methods to enhance the pedestrian environment with costs equitably assigned to properties receiving the benefits or generating excessive vehicle traffic.
Objective MT-6	Establish a network of multi-purpose pedestrian and bicycle paths, as well as limited access trails, to link residential areas to local and regional open spaces and recreational areas and urban Activity Centers in order to enhance Fresno's recreational amenities and alternative transportation options.
Policy MT-6-a	**Link Residences to Destinations.** Design a pedestrian and bicycle path network that links residential areas with Activity Centers, such as parks and recreational facilities, educational institutions, employment centers, cultural sites, and other focal points of the city environment.
Policy MT-6-g	**Path and Trail Development.** Require all projects to incorporate planned multi-purpose path and trail development standards and corridor linkages consistent with the General Plan, applicable law and case-by-case determinations as a condition of project approval.
Objective MT-8	Provide public transit options that serve existing and future concentrations of residences, employment, recreation and civic uses and are feasible, efficient, safe, and minimize environmental impacts.
Policy MT-8-a	**Street Design Coordinated with Transit.** Coordinate the planning, design, and construction of the major roadway network with transit operators to facilitate efficient direct transit routing throughout the Planning Area.
Policy MT-8-b	**Transit Serving Residential and Employment Nodes.** Identify the location of current and future residential and employment concentrations and Activity Centers throughout the transit service area in order to facilitate planning and implementation of optimal transit service area in order to facilitate planning and implementation of optimal transit services for these uses. Work with California State University, Fresno to determine locations within the campus core for bus stops.
Policy MT-8-g	**High Speed Train.** If the State moves forward with HST, ensure it is constructed through Fresno in a manner that minimizes impacts to surrounding property owners and creates the most opportunity for redevelopment around the HST station.
Objective MT-9	Provide public transit opportunities to the maximum number and diversity of people practicable in balance with providing service that is high in quality, convenient, frequent, reliable, cost-effective and financially feasible.
Policy MT-10-a	**Updating Parking Standards.** Update off-street parking standards to reflect the context and location within activity areas of multiple uses and reductions appropriate for mixed residential and non-residential uses and proximity to existing or planned transit service.
Policy MT-10-b	**Shared Parking.** Establish a strategy to promote the sharing of excess parking between uses within Activity Centers and BRT corridors, including specific provisions for this in the Development Code.
Policy MT-10-c	**Transportation Demand Management Guidelines.** Establish transportation demand management guidelines to allow for reduced off-street parking requirements.

Table A-1: General Plan Objectives and Policies

Transportation Element (Continued)	
Policy MT-10-d	**Parking Maximums.** Explore maximum off-street parking limits within Activity Centers proximate to BRT corridors, if such an Activity Center is determined compatible with promotion of a healthy and vigorous business environment.
Policy MT-10-f	**Parking Benefit Districts.** Establish parking benefit districts to fund consolidated public parking where supported by local businesses.
Park and Open Space	
Policy POSS-1-g	**Regional Urban Forest.** Maintain and implement incrementally, through new development projects, additions to Fresno's regional urban forest to delineate corridors and the boundaries of urban areas, and to provide tree canopy for bike lanes, sidewalks, parking lots, and trails.
Policy POSS-7-h	**Interlink City and San Joaquin River Parkway Trail Networks.** Strive to connect the parkway trail network to other trails in the vicinity, in order to create a community and regional trail system that offers a variety of different route combinations and enhances public access to the parkway.
Public Utilities	
Objective PU-7	Promote reduction in wastewater flows and develop facilities for beneficial reuse of reclaimed water and biosolids for management and distribution of treated wastewater.
Policy PU-7-a	**Reduce Wastewater.** Identify and consider implementing water conservation standards and other programs and policies, as determined and appropriate, to reduce wastewater flows.
Policy PU-7-d	**Wastewater Recycling.** Pursue the development of a recycled water system and the expansion of beneficial wastewater recycling opportunities, including a timely technical, practicable, and institutional evaluation of treatment, facility siting, and water exchange elements.
Policy PU-9-a	**New Techniques.** Continue to collaborate affected stakeholders and partners to identify and support programs and new techniques of solid waste disposal, such as recycling, composting, waste to energy technology, and waste separation, to reduce the volume and toxicity of solid wastes that must be sent to landfill facilities.
Policy PU-9-b	**Compliance with State Law.** Continue to pursue programs to maintain conformance with the Solid Waste Management Act of 1989 or as otherwise required by law and mandated diversion goals.
Resource Conservation and Resilience	
Objective RC-2	Promote land uses that conserve resources
Policy RC-2-a	**Link Land Use to Transportation.** Promote mixed-use, higher density infill development in multi-modal corridors. Support land use patterns that make more efficient use of the transportation system and plan future transportation investments in areas of higher-intensity development. Discourage investment in infrastructure that would not meet these criteria.
Policy RC-2-b	**Provide Infrastructure for Mixed-Use and Infill**. Promote investment in the public infrastructure needed to allow mixed-use and denser infill development to occur in targeted locations, such as expanded water and wastewater conveyance systems, complete streetscapes, parks and open space amenities, and trails. Discourage investment in infrastructure that would not meet these criteria.
Policy RC-4-i	**Methane Capture.** Continue to pursue opportunities to reduce air pollution by using methane gas from the old City landfill and the City's wastewater treatment process.
Objective RC-5	In cooperation with other jurisdictions and agencies in the San Joaquin Valley Air Basin, take timely, necessary, and the most cost-effective actions to achieve and maintain reductions in greenhouse gas emissions and all strategies that reduce the causes of climate change in order to limit and prevent the related potential detrimental effects upon public health and welfare of present and future residents of the Fresno community.
Policy RC-5-a	**Support State Goal to Reduce Statewide GHG Emissions.** As is consistent with State law, strive to meet AB 32 goal to reduce greenhouse gas emissions to 1990 levels by 2020 and strive to meet a reduction of 80 percent below 1990 levels by 2050 as stated in Executive Order S-03-05. As new statewide GHG reduction targets and dates are set by the State update the City's Greenhouse Gas Reduction Plan to include a comprehensive strategy to achieve consistency with those targets by the dates established.

Table A-1: General Plan Objectives and Policies

Resource Conservation and Resilience (Continued)	
Policy RC-5-b	**Greenhouse Gas Reduction Plan.** As is consistent with State law, prepare and adopt a Greenhouse Gas Reduction Plan as part of the Master Environmental Impact Report to be concurrently approved with the Fresno General Plan in order to achieve compliance with State mandates, assist development by streamlining the approval process, and focus on feasible actions the City can take to minimize the adverse impacts of growth and development on global climate change. The Greenhouse Gas Reduction Plan shall include, but not be limited to: ● A baseline inventory of all known or reasonably discoverable sources of GHGs that currently exist in the city and sources that existed in 1990. ● A projected inventory of the GHGs that can reasonably be expected to be emitted from those sources in the year 2035 with implementation of this General Plan and foreseeable communitywide and municipal operations. ● A target for the reduction of emissions from those identified sources. ● A list of feasible GHG reduction measures to meet the reduction target, including energy conservation and "green building" requirements in municipal buildings and private development. ● Periodically update municipal and community-wide GHG emissions inventories to determine the efficacy of adopted measures and to guide future policy formulation needed to achieve and maintain GHG emissions reduction targets.
Policy RC-5-c	GHG Reduction through Design and Operations. Increase efforts to incorporate requirements for GHG emission reductions in land use entitlement decisions, facility design, and operational measures subject to City regulation through the following measures and strategies: ● Promote the expansion of incentive-based programs that involve certification of projects for energy and water efficiency and resiliency. These certification programs and scoring systems may include public agency "Green" and conservation criteria, Energy Star™ certification, CALGreen Tier 1 or Tier 2, Leadership in Energy Efficient Design (LEED™) certification, etc. ● Promote appropriate energy and water conservation standards and facilitate mixed-use projects, new incentives for infill development, and the incorporation of mass transit, bicycle and pedestrian amenities into public and private projects. ● Require energy and water audits and upgrades for water conservation, energy efficiency, and mass transit, pedestrian, and bicycle amenities at the time of renovation, change in use, change in occupancy, and change in ownership for major projects meeting review thresholds specified in an implementing ordinance. ● Incorporate the City's "Guidelines for Ponding Basin/Pond Construction and Management to Control Mosquito Breeding" as conditions of approval for any project using an on-site stormwater basin to prevent possible increases in vector-borne illnesses associated with global climate change. ● Periodically evaluate the City's facility maintenance practices to determine whether there are additional opportunities to reduce GHGs through facility cleaning and painting, parks maintenance, road maintenance, and utility system maintenance. ● Periodically evaluate standards and mitigation strategies for highly vehicle-dependent land uses and facilities, such as drive-through facilities and auto-oriented development.
Policy RC-5-d	**SCS and CAP Conformity Analysis.** Ensure that the City includes analysis of a project's conformity to an adopted regional Sustainable Community Strategy or Alternative Planning Strategy (APS), an adopted Climate Action Plan (CAP), and any other applicable City and regional greenhouse gas reduction strategies in affect at the time of project review.
Policy RC-5-e	**Ensure Compliance.** Ensure ongoing compliance with GHG emissions reduction plans and programs by requiring that air quality measures are incorporated into projects' design, conditions of approval, and mitigation measures.
Policy RC-5-f	**Toolkit.** Provide residents and project applicants with a "toolkit" of generally feasible measures that can be used to reduce GHG emissions, including educational materials on energy-efficient and "climate-friendly" products.
Policy RC-5-g	**Evaluate Impacts with Models.** Continue to use computer models such as those used by SJVAPCD to evaluate greenhouse gas impacts of plans and projects that require such review.
Policy RC-6-d	**Recycled Water.** Prepare, adopt, and implement a City of Fresno Recycled Water Master Plan.

Table A-1: General Plan Objectives and Policies

Resource Conservation and Resilience (Continued)	
Objective RC-7	Promote water conservation through standards, incentives and capital investments.
Policy RC-7-a	**Water Conservation Program Target.** Maintain a comprehensive conservation program that reduces per capita water usage in the city's water service area to 243 gallons per capita per day (gpcd) by 2020 and 190 gpcd by 2035, by adopting conservation standards and implementing a program of incentives, design and operation standards, and user fees. ● Support programs that result in decreased water demand, such as landscaping standards that require drought-tolerant plants, rebates for water conserving devices and systems, turf replacement, xeriscape landscape for new homes, irrigation controllers, commercial/industrial/institutional water conserving programs, prioritized leak detection program, complete water system audit, landscape water audit and budget program, and retrofit upon resale ordinance. ● Implement the U.S. Bureau of Reclamation Best Management Practices for water conservation as necessary to maintain the City's surface water entitlements. ● Adopt and implement policies in the event an artificial lake is proposed for development. ● Work cooperatively toward effective uniform water conservation measures that would apply throughout the Planning Area. ● Expand efforts to educate the public about water supply issues and water conservation techniques.
Policy RC-7-c	**Best Practices for Conservation.** Require all City facilities and all new private development to follow U.S. Bureau of Reclamation Best Management Practices for water conservation, as warranted and appropriate
Policy RC-7-d	**Update Standards for New Development.** Continue to refine water saving and conservation standards for new development
Policy RC-7-e	**Retrofit City Facilities, and Consider Incentives Programs to Encourage Retrofitting of Other Existing Public and Private Residential and Non-Residential Facilities and Sites.** Reduce water use in municipal buildings and City operations by developing a schedule and budget for the retrofit of existing municipal buildings with water conservation features, such as auto shut-off faucets and water saving irrigation systems. Prepare a comprehensive incentive program for other existing public and private residential and non-residential buildings and irrigation systems.
Policy RC-7-f	**Implementation and Update Conservation Program.** Continue to implement the City of Fresno Water Conservation Program, as may be updated, and periodically update restrictions on water uses, such as lawn and landscape watering and the filling of fountains and swimming pools, and penalties for violations. Evaluate the feasibility of a 2035 conservation target of 190 gpcd in the next comprehensive update of the City of Fresno Water Conservation Program.
Policy RC-7-g	**Educate on State Requirements.** Educate the residents and businesses of Fresno on the requirements of the California Water Conservation Act of 2009.
Policy RC-7-h	**Landscape Water Conservation Standards.** Refine landscape water conservation standards that will apply to new development installed landscapes, building on the State Model Water Efficient Landscape Ordinance and other State regulations. ● Evaluate and apply, as appropriate, augmented xeriscape, "water- wise," and "green gardening" practices to be implemented in public and private landscaping design and maintenance. ● Facilitate implementation of the State's Water Efficient Landscape Ordinance by developing alternative compliance measures that are easy to understand and observe.
Policy RC-7-i	**PACE Financing.** Develop a residential Property Assessed Clean Energy (PACE) program, if it is determined to be a feasible option, to help finance water efficiency and energy efficiency upgrades for property owners.
Objective RC-8	Reduce the consumption of non-renewable energy resources by requiring and encouraging conservation measures and the use of alternative energy sources.
Policy RC-8-a	**Existing Standards and Programs.** Continue existing beneficial energy conservation programs, including adhering to the California Energy Code in new construction and major renovations.
Policy RC-8-b	**Energy Reduction Targets.** Strive to reduce per capita residential electricity use to 1,800 kWh per year and nonresidential electricity use to 2,700 kWh per year per capita by developing and implementing incentives, design and operation standards, promoting alternative energy sources, and cost-effective savings.

Table A-1: General Plan Objectives and Policies

Resource Conservation and Resilience (Continued)	
Policy RC-8-c	**Energy Conservation in New Development.** Consider providing an incentive program for new buildings that exceed California Energy Code requirements by fifteen percent.
Policy RC-8-d	**Incentives.** Establish an incentive program for residential developers who commit to building all of their homes to ENERGY STAR performance guidelines.
Policy RC-8-e	**Energy Use Disclosure.** Promote compliance with State law mandating disclosure of a building's energy data and rating of the previous year to prospective buyers and lessees of the entire building or lenders financing the entire building.
Policy RC-8-f	**City Heating and Cooling.** Reduce energy use at City facilities by updating heating and cooling equipment and installing "smart lighting" where feasible and economically viable.
Policy RC-8-g	**Revolving Energy Fund.** Create a City Energy Fund which uses first year savings and rebates from completed City-owned energy efficiency projects to provide resources for additional energy projects. Dedicate this revolving fund to the sole use of energy efficiency projects that will pay back into the fund.
Policy RC-8-h	**Solar Assistance.** Identify and publicize information about financial mechanisms for private solar installations and provide over-the-counter permitting for solar installations meeting specified standards, which may include maximum size (in kV) of units that can be so approved.
Policy RC-8-j	**Alternative Fuel Network.** Support the development of a network of integrated charging and alternate fuel station for both public and private vehicles, and if feasible, open up municipal stations to the public as part of network development.
Policy RC-8-k	**Energy Efficiency Education.** Provide long-term and ongoing education of homeowners and businesses as to the value of energy efficiency and the need to upgrade existing structures on the regular basis as technology improves and structures age.
Policy RC-11-a	**Waste Reduction Strategies.** Maintain current targets for recycling and re- use of all types of waste material in the city and enhance waste and wastewater management practices to reduce natural resource consumption, including the following measures: ● Continue to require recyclable material collection and storage areas in all residential development. ● Establish recycling collection and storage area standards for commercial and industrial facilities to size the recycling areas according to the anticipated types and amounts of recyclable material generated. ● Provide educational materials to residents on how and what to recycle and how to dispose of hazardous waste. ● Provide recycling canisters and collection in public areas where trash cans are also provided. ● Institute a program to evaluate major waste generators and identify recycling opportunities for their facilities and operations. ● Continue to partner with the California Integrated Waste Management Board on waste diversion and recycling programs and the CalMax (California Materials Exchange) program. ● Evaluate the feasibility of a residential, restaurant and institutional food waste segregation and recycling program, to reduce the amount of organic material sent to landfill and minimize the emissions generated by decomposing organic material. ● Evaluate the feasibility of "carbon footprinting" for the City's wastewater treatment facilities, biomass and composting operations, solid waste collection and recycling programs. ● Expand yard waste collection to divert compostable waste from landfills. ● Study the feasibility and cost-benefit analysis of a municipal composting program to collect and compost food and yard waste, including institutional food and yard waste, using the resulting compost matter for City park and median maintenance.
Policy RC-11-b	**Zero Waste Strategy.** Create a strategic and operations plan for fulfilling the City Council resolution committing the City to a Zero Waste goal.

GHG REDUCTION PLAN UPDATE: PROJECT CONSISTENCY CHECKLIST

This page intentionally left blank

FRESNO GREENHOUSE GAS (GHG) REDUCTION PLAN UPDATE

CEQA PROJECT CONSISTENCY CHECKLIST

March 2020

City of FRESNO

Fresno Greenhouse Gas (GHG) Reduction Plan Update – CEQA Project Consistency Checklist

INTRODUCTION

The City of Fresno updated its 2014 Greenhouse Gas (GHG) Reduction Plan (the Plan) in the year 2020 to conform with existing applicable State climate change policies and regulations. The GHG Plan Update outlines strategies that the City will undertake to achieve its proportional share of GHG emission reductions. The purpose of this GHG Reduction Plan Update Consistency Checklist (Checklist) is to help the City provide a streamlined review process for new development projects that are subject to discretionary review pursuant to the California Environmental Quality Act (CEQA) Guidelines Section 15183.5.

This Checklist has been developed as part of the GHG Plan Update implementation and monitoring process and will support the achievement of individual GHG reduction strategies as well as the City's overall GHG reduction goals. In addition, this Checklist will further the City's sustainability goals and policies that encourage sustainable development and aim to conserve and reduce the consumption of resources, such as energy and water. Projects that meet the requirements of this Checklist will be deemed to be consistent with the Fresno GHG Reduction Plan Update and will be found to have a less than significant contribution to cumulative GHG (i.e., the project's incremental contribution to cumulative GHG effects is not cumulatively considerable), pursuant to CEQA Guidelines Sections 15064(h)(3), 15130(d), and 15183(b). Projects that do not meet the requirements in this Checklist will be deemed to be inconsistent with the Fresno GHG Reduction Plan Update and must prepare a project-specific analysis of GHG emissions, including quantification of existing and projected GHG emissions and incorporation of the measures in this Checklist to the extent feasible. This GHG Checklist can be updated to reflect adoption of new GHG reduction strategies or to comply with any changes and updates in the Plan or local, State or federal regulations. Note that not all the measures in the checklist are applicable to all projects. The projects should comply with applicable measures from the checklist.

1. Project Information	
Contact Information	
Project No./Name:	
Address:	
Applicant Name/Co:	
Contact Information:	
Project Information	
1. What is the Site acreage of the Project?	
2. Identify all Applicable Proposed Land uses:	
a. Residential (Indicate number of single-family units)	
b. Residential (Indicate number of multi-family units)	
c. Commercial (total square footage)	
d. Industrial (total square footage)	
e. Other (describe)	
3. Is the project or a portion of the project located in a transit priority area? (Y/N)	
4. Provide a brief description of the project proposed:	

2. Determining Land Use Consistency		
Checklist Item		
As the first step in determining the consistency with the GHG Reduction Plan for discretionary development projects, this section allows the City to determine the project's consistency with the land use assumptions used in the GHG Reduction Plan.		
	Yes	**No**
1. Is the proposed project consistent with the approved General Plan, Specific Plan, and Community Plan planned land use and zoning designations? If the answer is **Yes**, then proceed to the GHG Plan Update Consistency Checklist. If the answer is **No**, then proceed to question 2.		
2. If the proposed project is not consistent with the approved planned land use and zoning designation(s), then provide estimated GHG project emissions under both existing and proposed designation(s) for comparison. Compare the maximum buildout of the existing designation with the maximum buildout of the proposed designation. If the estimated project emissions at maximum buildout of the proposed designation(s) **is equivalent to or less than** the estimated project emissions at maximum buildout of the existing designation(s), then in accordance with the City's Significance Determination Thresholds, the project's GHG impact is less than significant. If there is a proposed development project associated with this plan amendment and or rezone then complete the GHG Plan Update Consistency Checklist and incorporate applicable measures, otherwise there is no further step required. If the estimated project emission at maximum buildout of the proposed designation(s) is **greater than** the estimated project emissions at maximum buildout of the existing designation(s), then in accordance with the City's Significance Determination Thresholds, the project's GHG impact is significant. The project must either show consistency with applicable GP objectives and policies (provide applicable GP objectives and policies here) or provide analysis and measures to incorporate into the project to bring the GHG emissions to a level that is less than or equal to the estimated project emission at maximum buildout of the existing designation(s) unless the decision-maker finds that a measure is infeasible in accordance with CEQA Guidelines Section 15091. If there is a proposed development project associated with this plan amendment and or rezone then complete the GHG Plan Update Consistency Checklist and incorporate applicable measures, otherwise there is no further step required.		

3. Greenhouse Gas (GHG) Reduction Plan Update - CEQA Project Consistency Checklist

GHG Plan Update consistency review involves the evaluation of project consistency with the applicable strategies of the GHG Plan Update. This checklist was developed based on the key local GHG reduction strategies and actions identified in the GHG Plan Update that are applicable to new development projects.

Checklist Item (Check the appropriate box and provide an explanation for your answer)	Yes	No	Not Applicable (NA)	Explanation
Strategy 1: Land Use and Transportation Demand Management				
Does the project provide complete streets for all roadway improvements? (Complete streets are roadways that include curb, gutter, and sidewalks on both sides of the street. For local and collector streets, adequate roadway width is provided to accommodate two-way vehicle traffic and bicycles and arterial streets include striping for bike lanes.)				
Is the project a large employer (over 100 employees) and if so will the project comply with SJVAPCD Rule 9410 and provide an Employer Trip Reduction Implementation Plan that will include trip reduction methods such as increasing transit use, carpooling, vanpooling, bicycling, or other measures? See the SJVAPCD website link for details: https://www.valleyair.org/rules/currntrules/r9410.pdf				
Strategy 2: Energy Conservation and Renewable Energy				
Does the project meet the mandatory energy efficiency measures of the California Green Building Standards Code (CalGreen)? If the Project exceeds mandatory CalGreen measures then provide the tier number that the project will meet in the explanation.	X			
For commercial projects, does it achieve net zero electricity? Mark NA if project will be permitted before 2030. Mark Yes if voluntary. Add source and capacity in explanation.				
Does the project include onsite energy generation using renewable energy? If no, mark NA. If yes, provide source and capacity in the explanation.				
Strategy 3: Water Conservation				
Does the project meet the mandatory indoor water use measures of the CalGreen Code? If the project exceeds CalGreen Code mandatory measures provide methods in excess of requirements in the explanation. Examples may include water pipe insulation, pressure reducing valves, energy efficient appliances such as Energy Star Certified dishwashers, washing machines, dual flush toilets, point of use and/or tankless water heaters. Provide the measures, devices, or systems that the project will include in the explanation.	X			
Does the project meet the mandatory outdoor water use measures of the CalGreen Code? If the project exceeds CalGreen Code mandatory measures provide methods in excess of requirements in the explanation? Examples may include any outdoor water conservation measures such as; drought tolerant landscaping plants, compliant irrigation systems, xeriscapes etc. Provide the conservation measure that the project will include in the explanation.	X			
Strategy 4: Solid Waste Diversion and Recycling				
When completed will the project implement techniques for solid waste diversion and reduction (i.e., recycling, composting, waste to energy technology, waste separation)?	X			
During construction will the project recycle construction and demolition waste?	X			

APPENDIX C

GHG REDUCTION MEASURES FUNDING SOURCES

Implementation of the local GHG reduction strategies may require investment for the capital improvements and other investments, and increased operations and maintenance costs. However, in some cases, operating costs are anticipated to decrease, resulting in offset savings. Table C-1 presents a summary of potential funding and financing options available at the time of writing this document.

Table C-1: Potential Funding Sources to Support GHG Reduction Strategies

Funding Source	Description
State and Federal Funds	
Federal Tax Credits for Energy Efficiency	● Tax credits for energy efficiency can be promoted to residents.
Energy Efficient Mortgages (EEM)	● An EEM is a mortgage that credits a home's energy efficiency in the mortgage itself. ● Residents can finance energy-saving strategies as part of a single mortgage. ● To verify a home's energy efficiency, an EEM typically requires a home energy rating of the house by a home energy rater before financing is approved. ● EEMs are typically used to purchase a new home that is already energy efficient, such as an ENERGY STAR®-qualified home.
California Department of Resources Recycling and Recovery (CalRecycle)	● CalRecycle grant programs allow jurisdictions to assist public and private entities in management of waste streams. ● Incorporated cities and counties in California are eligible for funds. ● Program funds are intended to: ● Reduce, reuse, and recycle all waste ● Encourage development of recycled-content products and markets ● Protect public health and safety and foster environmental sustainability
California Energy Commission (CEC)	● CEC has energy efficiency financing options for projects with proven energy savings. These options include 0% interest rate loans for K–12 school districts, county offices of education, State special schools, community colleges, and 1% interest rate loans for cities, counties, special districts, public colleges or universities, public care institutions/public hospitals, University of California campuses, and California State University campuses. ● Projects eligible for the CEC energy efficiency financing low interest loans include: ● Lighting system upgrades ● Pumps and motors ● Streetlights and light-emitting diode (LED) traffic signals ● Building insulation ● Heating, ventilation and air conditioning equipment ● Water and waste water treatment equipment
California Air Resources Board (CARB)	● CARB offers several grants, incentives, and credits programs to reduce on-road and off-road transportation emissions. Residents, businesses, and fleet operators can receive funds or incentives depending on the program. ● The following programs can be utilized to fund local strategies: ● Air Quality Improvement Program (Assembly Bill 118) ● Carl Moyer Program – Voucher Incentive Program ● Goods Movement Emission Reduction Program (Proposition 1B Incentives) ● Loan Incentives Program ● Lower-Emission School Bus Program/School Bus Retrofit and Replacement Account (Proposition 1B and United States Environmental Protection Agency Incentives)

Table C-1: Potential Funding Sources to Support GHG Reduction Strategies

Funding Source	Description
Existing Capital Improvement Program	● State and federal funds would most likely continue to local governments, builders, and homeowners in the following forms: ● Grants ● Transportation and transit funding ● Tax credit and rebate programs ● The Capital Improvement Program can be used for strategies relating to traffic or transit.
State Funding for Infrastructure	● The State's Infill Infrastructure Grant Program may potentially be used to help fund strategies that promote infill housing development. ● Grants can be used for gap funding for infrastructure improvements necessary for specific residential or mixed-use infill development projects.
Transportation-Related Federal and State Funding	● For funding strategies related to transit, bicycle, or pedestrian improvements, the following funding sources from SCAG may be used: ○ Sustainability Planning Grant ○ California Active Transportation Program ○ Caltrans Transportation Planning Grant Program provides funding that would lead to programming and implementation of transportation improvement projects. ○ Sustainable Communities Grants ○ Strategic Partnerships Grants ○ Adaptation Planning Grants
Utility Rebates	● Department of Water and Power offers a variety of residential and commercial rebate programs: ○ Residential and Commercial Turf Replacement Program ○ Pool/Spa Cover Rebates ○ Rebates for Water-Efficient Devices ○ Recirculating Pump Rebate ○ Free Urinal Flush Valve Upgrades and Installation ○ Pacific Gas and Electric Company (PG&E) is one of the utilities participating in the California Solar Initiative. ○ A variety of rebates are available for existing and new homes. ○ Photovoltaics, thermal technologies, and solar hot water projects are eligible. ○ Single-family homes, commercial development, and affordable housing are eligible.
Energy Upgrade California	● The program is intended for home energy upgrades. ● Funding comes from the American Recovery and Reinvestment Act, California utility ratepayers, and private contributions. ● Utilities administer the program, offering homeowners the choice of one of two upgrade packages—basic or advanced. ● Homeowners are connected to home energy professionals. ● Rebates, incentives, and financing are available. ● Homeowners can receive up to $4,000 back on an upgrade through the local utility.
Private Funding	
Private Funding	● Private equity can be used to finance energy improvements, with returns realized as future cost savings. ● Rent increases can fund retrofits in commercial buildings. ● Net energy cost savings can fund retrofits in households. ● Power Purchase Agreements involve a private company that purchases, installs, and maintains a renewable energy technology through a contract that typically lasts 15 years. After 15 years, the company would uninstall the technology or sign a new contract. ● On-Bill Financing (OBF) can be promoted to businesses for energy-efficiency retrofits. OBF funding is a no-interest loan that is paid back through monthly utility bills. Lighting, refrigeration, HVAC, and LED streetlights are all eligible projects.

Table C-1: Potential Funding Sources to Support GHG Reduction Strategies

Funding Source	Description
Other Funding Mechanisms for Implementation	
Other Funding	● Increased operating costs can be supported by grants from the Strategic Growth Council or the State Department of Conservation to fund sustainable community planning, natural resource conservation and development, and adoption.
Future Funding Options: Funding Mechanisms for Capital and/or Implementation Costs	
New Development Impact Fees	● These types of fees may have some potential to provide funding, but such fees are best implemented when the real estate market and overall regional economic conditions are strong.
General Obligation Bond	● A general obligation bond is a form of long-term borrowing and could be used to fund municipal improvements.

Source: Compiled by LSA Associates, Inc. (2019).
HVAC = heating, ventilation, and air conditioning

In addition to pursuing the funding options above and monitoring the availability of others, the City should take the following steps to best inform decisions related to the cost of GHG reduction strategies:

- **Perform and Refine Cost Estimates:** Cost estimates for local reduction strategies should be performed to identify the cost-effectiveness of each strategy to inform and to guide the implementation process. This analysis will likely be based on a variety of participation, per-unit, and other assumptions. As programs are developed, cost estimates should be refined and updated over time with more precise implementation-level data.
- **Integrate GHG Reduction into Existing City Budget and Capital Improvements Program:** Certain capital improvements may need to be added to the City's Capital Improvements Program (CIP) and facility master plan programs, as well as those of the City utility enterprises and other public agencies that have control for project implementation. For CIPs completely under the City's control, new projects would need to be assessed for consistency with the GHG Plan Update.
- **Adopt or Update Ordinances and/or Codes:** Some local reduction strategies may require new or revised ordinances. Staff would need to coordinate these efforts in conjunction with planning departments, planning commissions, and City councils.
- **Pursue Outside Funding Sources:** A range of funding from State and federal agencies has been identified. The City would need to pursue these (and other emerging) funding sources as a part of implementation efforts.
- **Implement and Direct Preferred City Funding Sources:** While City funding sources are limited, the City, when financially able, as a part of its budget process, could appropriate funding from general sources or make changes in its fee schedules, utility rates, and other sources as needed to support funding the implementation of the GHG reduction strategies.
- **Create Monitoring/Tracking Processes:** Local reduction strategies would require program development, tracking, and/or monitoring.

Identify Economic Indicators to Consider Future Funding Options: Economic recovery may occur rapidly or slowly. Whatever the timeframe, the City would need to determine the point at which

certain additional funding sources may become feasible and/or favorable. Identification and monitoring of economic indicators and trends, such as home prices, energy prices, cost per kWh on solar installations, unemployment rates, or real wage increases, can help the City decide when to further explore the potential for funding local reduction strategies through different financing mechanisms.

To encourage implementation of all reduction strategies, City staff could develop a GHG Plan Update Implementation Timeline. GHG reduction Strategy prioritization could be based on the following factors:

- **Cost/Funding:** How much does the strategy cost? Is funding already in place for the strategy?
- **Greenhouse Gas Reductions:** How effective is the strategy at reducing greenhouse gases?
- **Other Benefits:** For example, does the strategy improve water quality or conserve resources? Would it create jobs or enhance community well-being?
- **Consistency with Existing Programs:** Does the strategy complement or extend existing programs?
- **Impact on the Community:** What are the advantages and disadvantages of the strategy to the community as a whole?
- **Speed of Implementation:** How quickly can the strategy be implemented and when would the City begin to see benefits?
- **Implementation Effort:** How difficult will it be to develop and implement the program?

A qualitative appraisal of implementation effort for the City is also provided. Strategies can be categorized based on the convention of low, medium, or high, with low-level strategies requiring the least level of effort by the City and being the most likely to be pursued immediately (i.e., the low-hanging fruit). Sample criteria are shown in Table C-2.

Table C-2: Implementation Matrix

Implementation Effort Level	Sample Criteria
Low	● Requires limited staff resources to develop. ● Existing programs in place to support implementation. ● Required internal and external coordination is limited. ● Required revisions to policy or code are limited.
Medium	● Requires staff resources beyond the typical daily level. ● Policy or code revisions become necessary. ● Internal and external coordination (e.g., with stakeholders, other cities or agencies, or general public) is necessary.
High	● Requires extensive staff time and resources. ● Requires the development of completely new policies or programs and potential changes to the general plan. ● Requires a robust outreach program to alert residents and businesses of program requirements and eligibility. ● Requires regional cooperation and securing long-term funding.

EPIDEMIOLOGIC SUMMARY OF VALLEY FEVER (COCCIDIOIDOMYCOSIS) IN CALIFORNIA, 2020-2021

Surveillance and Statistics Section
Infectious Diseases Branch

Department of Public Health

Epidemiologic Summary of Valley Fever (Coccidioidomycosis) in California, 2020 - 2021

Key Findings

Valley fever (also known as coccidioidomycosis or “cocci”) is a disease caused by a fungus that grows in the soil and dirt in some areas of California and the southwestern United States. People and animals can get sick when they breathe in dust that contains the Valley fever fungus. Valley fever can be serious and even fatal. Each year in California, there are around 80 deaths from Valley fever and more than 1,000 people are hospitalized with it.

Valley Fever in California in 2020-2021

Total Cases: A total of 7,252 and 8,030 new Valley fever cases were reported in 2020 and 2021, respectively.

Rate: The rate of Valley fever in 2020 was about 18 cases per 100,000 people, and the rate in 2021 was about 20 cases per 100,000 people.

- **By County**: The number of new Valley fever cases was highest in Kern County, with a total of 2,626 cases (about 288 cases per 100,000 people) in 2020 and 2,819 cases (about 306 cases per 100,000 people) in 2021. Counties with the next highest rates of Valley fever in 2021 included Kings, Tulare, San Luis Obispo, Fresno, Merced, and Monterey. Overall, most cases of Valley fever in California are reported in people who live in the Central Valley and Central Coast regions, which include the counties listed above.
- **By Sex**: Similar to previous years, the rates of Valley fever in both 2020 and 2021 were higher in males (2020: about 21 cases per 100,000 males; 2021: about 23 cases per 100,000 males) than in females (2020: about 16 cases per 100,000 females; 2021: about 17 cases per 100,000 females).
- **By Age Group**: In both 2020 and 2021, the rates of Valley fever were highest in people aged 55-64 and 75-84 years (2020: both about 28 cases per 100,000 people; 2021: both about 32 cases per 100,000 people) than in any other age group. The lowest rates of Valley fever were reported in children.
- **By Race/Ethnicity**: For cases where race and ethnicity information were available, there was a higher percentage of Valley fever cases in people who reported Hispanic/Latino ethnicity (47%) and Black, non-Hispanic race (8%) than would be expected compared to the percentage of those groups living in California.

To decrease the risk of Valley fever, people who live, work, or travel in areas where Valley fever has been reported should avoid spending time outside in dusty areas as much as possible. Avoiding outdoor dust can help reduce the risk of breathing in the Valley fever fungus from dust in the air. On windy and dusty days, people should stay inside and keep windows and doors closed, especially if they live in the Central Valley or Central Coast of California where Valley fever is more common.

For more information about Valley fever, please visit www.CouldBeValleyFever.org. For additional data on Valley fever, please visit the CDPH Valley Fever Data and Publications webpage.

Background

Coccidioidomycosis (also known as Valley fever) results from inhaling spores of the dimorphic fungus *Coccidioides* spp. (*Coccidioides immitis* and *Coccidioides posadasii*) from soil or airborne dust in areas where this fungus grows. Coccidioidomycosis is not transmitted directly from person to person. The fungus *Coccidioides* spp. grows throughout much of the southwestern United States, and, in California, most cases of Valley fever are reported among people residing in counties of the southern Central Valley and Central Coast.

Following an incubation period of 1 to 3 weeks, clinical manifestations occur in 40 percent of persons infected with coccidioidomycosis and range from a relatively mild illness with symptoms such as cough, fever, or difficulty breathing, to severe pneumonia, and rarely, disseminated disease.

Disseminated infection, which can be fatal, most commonly involves skin and soft tissues, bones, and the central nervous system. Persons at increased risk for severe disease include persons who are Black or Filipino, pregnant women, adults of older age groups, and people with weakened immune systems.[1]

This report describes the epidemiology of reported coccidioidomycosis in California in 2020-2021 and present surveillance and demographic data for years 2015 through 2021. Because some persons with coccidioidomycosis experience chronic infection and may be reported more than once, only the first report of coccidioidomycosis per person was included using a probabilistic de-duplication method spanning multiple surveillance reporting years. For a complete discussion of the definitions, methods, and limitations associated with this report, please refer to the Technical Notes at the end of this report.

California Reporting Requirements and Surveillance Case Definition

California Code of Regulations (CCR), Title 17, Section 2500 requires health care providers to report suspected cases of coccidioidomycosis to their local health department (LHD) within 7 days or immediately by telephone if an outbreak is suspected. Since 2010, CCR, Title 17, Section 2505 has also mandated laboratories to report to the local health jurisdiction.[2]

California regulations require local health officers to report cases of coccidioidomycosis to the California Department of Public Health (CDPH). During this surveillance period, CDPH defined a confirmed coccidioidomycosis case per the Council of State and Territorial Epidemiologists (CSTE) as a person with clinically compatible illness and at least one of the following: culture, histopathologic, or molecular evidence of *Coccidioides* species; positive serologic test for coccidioidal antibodies in serum, cerebrospinal fluid, or other body fluids by detection of coccidioidal immunoglobulin M (IgM) by immunodiffusion, enzyme immunoassay (EIA), latex agglutination, or tube precipitin; detection of coccidioidal immunoglobulin G (IgG) by immunodiffusion, EIA, or complement fixation; or coccidioidal skin-test conversion from negative to positive after onset of clinical signs and symptoms. Clinically compatible illness includes one or more of the following: influenza-like signs and symptoms, pneumonia or other pulmonary lesion, erythema nodosum or multiforme rash, involvement of the bones, joints, or skin by dissemination, meningitis, or involvement of viscera or lymph nodes.[3] Since January 2019, confirmed cases need only laboratory evidence to be reported. Cases included in this report were confirmed by LHDs by either meeting the clinical and laboratory criteria of the CSTE case definition or just the laboratory criteria if clinical confirmation was not feasible; CDPH accepts all cases confirmed by LHDs.

Epidemiology of Coccidioidomycosis in California

Incidence of coccidioidomycosis in 2020 was 18.2 per 100,000 population (7,252 case-patients) and 20.1 per 100,000 population in 2021 (8,030 case-patients). The incidence decreased by 20.5 percent from 2019 to 2020 and increased by 10.4 percent from 2020 to 2021. For most years prior to 2020, monthly case counts were lowest at the beginning of the year and gradually increased to peak in October or November. However, in 2020 from March to April, monthly case counts decreased by 28.4 percent. In 2021, monthly case counts were fairly consistent throughout the year (Table 2).

In 2020, incidence among males was 20.7 per 100,000 population (4,102 case-patients) and was higher than incidence among females of 15.7 per 100,000 (3,136 case-patients). Similarly in 2021, incidence among males was 23.4 per 100,000 (4,673 case-patients) and was higher than incidence among females of 16.7 per 100,000 (3,347 case-patients) (Table 3). By age group in both 2020 and 2021, incidence was highest and equal among people aged 55-64 and 75-84 years (2020: about 28 cases per 100,000 people; 2021: about 32 cases per 100,000 people) (Table 4 and Figure 2). Among children ages 17 years and younger, incidence was 3.8 per 100,000 in both 2020 (334 case-patients) and 2021 (336 case-patients). Among adults ages 18 years and older, incidence was 22.4 per 100,000 in 2020 (6,898 case-patients) and 24.8 per 100,000 in 2021 (7,681 case-patients).

Statewide in both 2020 and 2021, the incidence was highest in Kern County (2020: 287.6 per 100,000; 2626 case-patients, 2021: 306.2 per 100,000; 2819 case-patients), followed by Kings County (2020: 101.5 per 100,000; 157 case-patients, 2021: 108.3 per 100,000; 168 case-patients). Other counties with high incidence included Tulare (2020: 64.3 per 100,000; 309 case-patients), 2021: 65.8 per 100,000; 317 case-patients), San Luis Obispo (2020: 64.5 per 100,000; 178 case-patients, 2021: 61.0 per 100,000; 170 case-patients), Fresno (2020: 43.6 per 100,000; 448 case-patients, 2021: 39.8 per 100,000; 407 case-patients), Merced (2020: 27.4 per 100,000; 78 case-patients, 2021: 28.3 per 100,000; 81 case-patients), and Monterey (2020: 25.2 per 100,000; 111 case-patients, 2021: 27.0 per 100,000; 120 case-patients) (Table 1 and Figure 3). Approximately 56.5 and 52.1 percent of all California case-patients in 2020 and 2021, respectively, resided in these counties at the time of illness onset.

Incidence by race/ethnicity was not calculated due to missing race/ethnicity data for 34.9% of reported cases in 2015 through 2021. However, for cases with complete race/ethnicity data, a higher percentage of cases reported Hispanic ethnicity (46.5%) and Black non-Hispanic race (7.8%) than would be expected based on the overall demographic profile of California (39.1% Hispanic, 5.7% Black non-Hispanic) (Table 5 and Figure 4).

Comments

Since 2019, the number and incidence of new Valley fever cases have decreased in 2020 and increased slightly in 2021 although still lower than in 2019. In 2020, case counts began to decrease in April, which coincided with the beginning of the COVID-19 pandemic in California. Some additional cases for 2020 and 2021 may be reported after this summary report due to delays in diagnosis and reporting; future coccidioidomycosis summary reports will have updated case numbers and incidence.

Age group, race/ethnicity, gender, and county epidemiologic profiles of incident cases with estimated illness onset dates in 2020 and 2021 are similar to those reported in

coccidioidomycosis epidemiologic summaries from earlier years as described previously.[4]

The causes of the increase of coccidioidomycosis in recent years are not well understood but contributing factors may include climatic and environmental factors favorable to *Coccidioides* proliferation and airborne release, increase in endemic areas of susceptible residents, and increase in disease recognition, testing, and reporting. In particular, reporting completeness likely improved following the initiation of automatic electronic laboratory reporting in 2014.

Coccidioidomycosis is most commonly reported among residents of the counties of the southern Central Valley and Central Coast of California and remains an important public health problem in the state. There is currently no vaccine to prevent coccidioidomycosis, but antifungal medications are available for treatment, particularly for severe disease. To decrease the risk of infection, persons living, working, or traveling in areas where coccidioidomycosis is common, especially those at increased risk for disseminated disease, should limit their exposure to outdoor dust as much as possible, including by staying inside and keeping windows and doors closed when it is windy and the air is dusty. Employers should inform outdoor workers about symptoms of coccidioidomycosis and take steps to limit workers' exposure to dust, such as watering down the soil before digging. It is important that health care providers be alert for coccidioidomycosis among patients who live in or have traveled to areas where the *Coccidioides* fungus may be present, especially those who work or participated in activities where soil is disturbed.[1, 5]

For more information on coccidioidomycosis, including education materials and data from previous years, please visit the CDPH Coccidioidomycosis webpage (https://www.cdph.ca.gov/Programs/CID/DCDC/Pages/Coccidioidomycosis.aspx).

34.9% (n=16938) of reported incidents of Coccidioidomycosis did not identify race/ethnicity and 6.7% (n=3253) of reported incidents identified as 'Other' race/ethnicity and are not included in the Case Percent calculation. Information presented with a large percentage of missing data should be interpreted with caution.

Technical Notes

Background

The California Department of Public Health (CDPH) Infectious Diseases Branch maintains a passive reporting system for a list of communicable disease cases and outbreaks, including coccidioidomycosis, mandated by state law and regulation.[2] Healthcare providers and laboratories are required to report known or suspected cases of these communicable diseases to their local health department (LHD). LHDs in turn report these cases to CDPH.

The collection and distribution of information on the health of the community is a core function and essential service of public health. The data in this epidemiologic summary provide important health information on the magnitude and burden of coccidioidomycosis in California. Bearing in mind their limitations, these surveillance data can contribute to the identification of risk groups to whom intervention strategies and actions can be targeted, and aid in assessing the effectiveness of these control and prevention measures.

Materials and methods

Case data sources and inclusion criteria

Included in this document-- Epidemiologic Summary of Coccidioidomycosis in California, 2020-2021-- are incident cases of coccidioidomycosis with estimated illness onset dates from January 1, 2015 through December 31, 2021. These data were extracted from California Confidential Morbidity Reports that LHDs submitted to CDPH by July 20, 2022. The Council of State and Territorial Epidemiologists (CSTE) surveillance case definition requires both clinical and laboratory criteria for reporting cases as confirmed.[3] However, some LHDs used laboratory results only due to resource constraints; CDPH accepts all cases closed by LHDs as confirmed. Due to delays in provider reporting and time required for LHDs to complete clinical, laboratory, and epidemiologic investigation of reported cases, LHDs may continue to add and rescind cases with eligible illness onset dates after the closeout date of this summary. Data used in this report were quality checked and duplicate records were removed based on a data matching algorithm. Because coccidioidomycosis may occur as a chronic condition and be reported more than once, only the first report of coccidioidomycosis per person was included based on estimated illness onset using a probabilistic de-duplication method spanning multiple surveillance reporting years.

Population data source

For the 2020-2021 Epidemiologic Summary of Coccidioidomycosis in California, State of California, Department of Finance projections and estimations population data were used.[6, 7, 8, 9]

Definitions

A case was defined as a person who had laboratory and/or clinical evidence of infection that satisfied the most recent surveillance case definition published by the CSTE. Coccidioidomycosis cases included in the report were closed by the LHDs either after having met case definition criteria for a confirmed case or using laboratory results only; CDPH accepts all cases closed by LHDs as confirmed.

Estimated date of illness onset was defined as the date closest to the time when symptoms first appeared. For cases for which an illness onset date was not explicitly reported, estimated date of illness onset was selected as the earliest of: date of diagnosis, date the case was reported to or received by CDPH, date of laboratory specimen collection, or date of patient death. Because illness onset of coccidioidomycosis is often insidious, estimated illness onset was frequently drawn from the diagnosis date.

Cases were classified to local health jurisdiction according to the case-patient's county of residence. This classification may not correspond to the county where the case-patient was exposed, sought medical care, or was diagnosed.

Sex categories were defined as follows: Female (including Male to Female transgender) and Male (including Female to Male transgender). Cases that did not report a sex were listed as Unknown.

Mutually exclusive race/ethnicity categories were defined as follows: Hispanic/Latino (of any, including unknown, race), and non-Hispanic White, Black, Asian/Pacific Islander, American Indian/Alaska Native, Multiple Race, and Other. Cases for which race and ethnicity were not reported were categorized as Unknown.

Data analyses

Within this epidemiologic summary, incidence rates (or the number of cases per 100,000 people per year) are used to convey how common a disease is in a place (such as a county) or a group (such as sex or age) compared to the number of people in that place or group (the population). Different places and groups have different population sizes, and the number of new cases in those places or groups can mean different things based on the size of the population. To understand which place or group has a higher risk of disease, it is better to compare their incidence rates than the number of cases.

Case totals and incidence rates per 100,000 population were reported and stratified by local health jurisdiction, year of estimated illness onset, sex, and age group.

Incidence rate (IR) = (Number of cases in specified year(s)/population) x 100,000

Standard error (SE) = IR/√number of cases

Relative standard error = SE/IR x 100

An incidence estimate was defined as unreliable if the relative standard error was 23 percent or more (a threshold recommended by the National Center for Health Statistics).[10] A substantial portion of race/ethnicity data were missing, thus incidence rates by race/ethnicity were not calculated. However, for comparison we depicted case totals and California population totals by race/ethnicity.

Tables and figures

The following tables and figures are included in this report; please note that the tables and figures may be altered or suppressed to minimize depiction of unreliable IRs:

Tables:

1. *Coccidioidomycosis, Cases and Incidence Rates by Health Jurisdiction, California, 2015-2021*
2. *Coccidioidomycosis, Cases by Month of Estimated Illness Onset, California, 2015-2021*

Figures:

1. *Coccidioidomycosis, Cases and Incidence Rates by Year of Estimated Illness Onset, California, 2015-2021*
2. *Coccidioidomycosis, Incidence Rates by Age Group and Year of Estimated Illness Onset, California, 2015-2021*
3. *Coccidioidomycosis, Annual Incidence Rate by County, California, 2015-2021*
4. *Coccidioidomycosis, Cases and Population by Race/Ethnicity, California, 2015-2021*

Limitations

Completeness of reporting

The number of reported cases of coccidioidomycosis summarized in this report are likely to underestimate the true magnitude of the disease. Factors that may contribute to under-reporting include ill persons not seeking health care, misdiagnoses, not ordering diagnostic tests, and limited reporting by clinicians and laboratories. Factors that may enhance disease reporting include increased exposure and disease severity, recent media or public attention, and active surveillance activities.

Because race/ethnicity information was missing or incomplete for 34.5 percent of all 2015-2021 cases included in this report, IRs by race/ethnicity were not calculated. However, the proportion of cases representing race/ethnicity categories are presented alongside statewide averages for these categories during the seven-year surveillance period. Nonetheless, race/ethnicity information based on a high percentage of missing data should be interpreted with caution.

Data presented in this report may differ from previously published data due to delays inherent to case reporting, laboratory reporting, and epidemiologic investigation.

Small numbers and rate variability

All IRs are subject to random variation. Random variation may be substantial when the number of cases is small (e.g., less than 20) and can obscure distinguishing random statistical fluctuations from true changes in the incidence of disease. Rates and proportions based on small numbers of cases should be interpreted with caution.

Rate comparisons

Incidence rate comparisons between local health jurisdictions and surveillance years should be done with caution.

Emission Impact: Additional Generator Usage Associated with Power Outage

January 30, 2020

This report has been reviewed by the staff of the California Air Resources Board. The contents do not necessarily reflect the views and policies of the California Air Resources Board, nor does mention of trade names or commercial products constitute endorsement or recommendation for use.

Summary

For public safety, it may be necessary for utilities to turn off electricity when gusty winds and dry conditions, combined with a heightened fire risk, are forecasted. This is called a "Public Safety Power Shutoff" or "PSPS". According to CPUC de-energization report[1], in October 2019, there have been almost 806 PSPS events that have impacted almost 973,000 customers (~7.5% of households in California) of which ~854,000 of them were residential customers, and the rest were commercial/industrial/medical baseline/other customers. Data also indicates that on average each of these customers had about 43 hours of power outage in October 2019.

Following the PSPS events, many households and businesses in California started operating their back-up generators to provide power for their day-to-day operations. Generators used during power outage will increase emissions as compared to an average day. Staff assessment indicated that with 973,000 customers impacted by PSPS events in October 2019, approximately 125,000 back-up generators were used by customers to provide electricity during power outage. Assuming 50 hours of operation per generator during month of October 2019, staff estimated excess emissions from the use of generators which are summarized in Table 1.

Table 1: Population and excess emissions from the use of electricity power generators during October 2019 PSPS events.

Generator Type		NOx (tons)	PM (tons)	Diesel PM (tons)	Additional Generators Running in PSPS
Portable	Gasoline Less than 25 hp	24.3	10.6		122,000
	Diesel above 25 hp *Non-Rental Generator*	7.3	0.30	0.30	381
	Diesel above 25 hp *Rental Generator*	9.1	0.30	0.30	582
Permitted Stationary Back-Up Generators (Assuming 30% Load Factor)		125.7	8.3	8.3	1,810
Non-permitted generators[2]		N/A	N/A	N/A	N/A
Total		***166.4***	***19.4***	***8.9***	***124,774***

[1] https://www.cpuc.ca.gov/deenergization/

[2] This analysis does not include emissions estimates from non-permitted generators such as the residential standby natural gas powered generators with power rating of less than 50 hp (e.g, a 22 kW Guardian Series home standby generator by Generac). At this point there is no information available on their population and sales. According to discussion with industry, it is assumed that most of these generator are powered by natural gas.

To put these numbers into context, 9 tons of diesel PM is equivalent to emissions from almost 29,000 heavy duty diesel trucks (above 14,000 lbs.) driving on California roadways for the period of one month (on average each truck drives around 3,000 miles per month).

The calculations described in the rest of the document outlines the assumptions used to estimate potential emissions impact from the use of gasoline and diesel generators during PSPS events.

Small Gasoline Powered Generators (less than 25 hp)

Population

Based on 2018 California State University Fullerton (CSUF) Survey[3] for small off-road (SORE) equipment, about one out of 8 households own a generator in California. For a population of 973,000 households, about 122,000 generators will likely to be used to provide additional power during the power shut-off period.

Emission Factors

According to data provided by manufacturers as part of the SORE Evaporative Reporting Requirement[4], generators have an average horsepower of 3.5 hp of which when combined with a load factor of 0.68, derived from OFFROAD2007[5], results in an effective power of 2.4 hp. To determine emission factors, we used emissions data from SORE exhaust certification database. Table 2 shows the derived emission factors along with weighted average emission factors across all horsepower bins.

Table 2: Exhaust emission factors (g/bhp-hr) for gasoline powered generator less than 25 hp

Equipment	Tech Type	Horsepower	Percent Population	HC (g/bhp-hr)	NOX (g/bhp-hr)	PM (g/bhp-hr)
Generator Sets	G2-CARB	0 – 2	5%	27.860	0.900	0.600
	G4-CARB	2 – 5	82%	5.634	1.484	0.740
		5 – 15	9%	2.885	1.975	0.140
		15 – 25	3%	3.390	1.422	0.140
	G4-FI	15 – 25	1%	1.074	2.125	0.140
	Population Weighted Average			**6.296**	**1.505**	**0.655**

Using the effective power and emission factors described earlier, staff estimated excess emissions as well emissions during 50 hours of generators operation (5 days with 10 hours a day operation). For example, with 122,000 generators operating for 50 hours during power shutoff, staff estimated excess emissions of 24.3 tons of NOx, 101.5 tons of THC, and 10.6 tons of PM. The calculation below outlines the assumptions used for this emissions impact assessment. Obviously, a more refined estimate can be made with additional information.

[3] Survey of Small Off-Road Engines (SORE) Operating within California: Results from Surveys with Four Statewide Populations, Submitted May 15, 2019, Prepared by the Social Science Research Center (SSRC) at CSU, Fullerton.
[4] https://ww3.arb.ca.gov/msprog/mailouts/ecars1805/ecars1805.pdf?_ga=2.15158582.1846785299.1570743950-1632999103.1458687259
[5] https://ww2.arb.ca.gov/our-work/programs/mobile-source-emissions-inventory/msei-road-archives

Portable Diesel Generators (above 25 hp)

Portable diesel generators are generally much larger and supply more power than gasoline generators, and could be used during PSPS events to supply power to larger facilities (such as schools, industrial facilities, or buildings). Table 3 provides CARB's latest population, activity, and emissions associated diesel portable generators registered under CARB's PERP program[6].

Table 3: Emissions and Population of Diesel portable generators registered under CARB's PERP program

	Population (statewide)	Annual Activity (hours)	NOx (tons/yr)	PM (tons/yr)	PM25 (tons/yr)
Portable Equipment - Non-Rental Generator	5,081	1,299	2,537	99	91
Portable Equipment - Rental Generator	7,764	1,392	3,363	123	113

For assessing the emissions impact associated with this event, this analysis will assume that the percent of businesses that use generators and backup generators that are impacted by the PSPS is roughly proportional to the percent of households impacted (about 973,000 households out of 13,000,000 in California, or about 7.5 percent of the population of generators in the state). Table 4 shows the excess emissions from the use of portable diesel power generators during PSPS events assuming 50 hours of operations.

Table 4: Population and excess emissions from the use of portable diesel powered generators during October 2019 PSPS events

	Additional Generators Running in PSPS	NOx (tons)	PM (tons)	PM2.5 (tons)
Portable Equipment - Non-Rental Generator	381	7.3	0.30	0.30
Portable Equipment - Rental Generator	582	9.1	0.30	0.30
Total	**964**	**16.45**	**0.61**	**0.61**

Permitted Stationary Back-Up Generators (BUG)

Population

Data on permitted stationary back-up generators were provided to CARB by several air districts. Staff used the facility ID from the districts permit data to find the address of the facility that the stationary BUGs are operating and determined whether those BUGs were impacted by the PSPS events or not. Using this process, staff determined that almost 1,810 stationary BUGs across California were impacted by the October 2019 PSPS events.

Emission Factors

Additionally, using actual emission factors for each diesel BUG engines provided in the districts' stationary BUGs database (i.e., stationary BUGs permit database), staff assumed a work based emission factors of 0.44 g/bhp-hr for PM and 6.7 g/bhp-hr for NOx, based on averaging of a

[6] https://ww2.arb.ca.gov/our-work/programs/portable-equipment-registration-program-perp

sample of permitted diesel powered backup generators in the state. The analysis also indicated that an average permitted back-up generator has a power rating of ~ 627 hp and they can go up as high as 4,400 hp which when combined with a load factor assumption of 30% resulted in an effective power of 188 hp. Table 5 provides a summary of excess emissions associated with the stationary BUGs impacted by the PSPS events.

Table 5: Population and excess emissions from the use of diesel powered stationary back-up generators (BUG) during October 2019 PSPS events

EXECUTIVE DEPARTMENT
STATE OF CALIFORNIA

EXECUTIVE ORDER N-11-21

WHEREAS on July 9, 2021, I proclaimed a State of Emergency to exist in California as a result of a significant heat wave that struck California beginning July 8, 2021, bringing widespread near-record temperatures well in excess of 100 degrees throughout the State (the "Extreme Heat Event"), and as a result of the impacts of the Bootleg Fire in Southern-Central Oregon on California's electricity supply from the Pacific Northwest; and

WHEREAS the Extreme Heat Event continues to bring temperatures that put significant demand and strain on California's energy grid; and

WHEREAS the Bootleg Fire continues to threaten the California Oregon Intertie, causing ongoing impacts to delivery of electricity to California from the Pacific Northwest; and

WHEREAS the Extreme Heat Event is expected to last through at least July 12, 2021; and

WHEREAS it is necessary to take further action to reduce the strain on the energy infrastructure and increase energy capacity during the Extreme Heat Event; and

WHEREAS under the provisions of Government Code section 8571, I find that strict compliance with various statutes and regulations specified in this Order would prevent, hinder, or delay appropriate actions to prevent and mitigate the effects of the Extreme Heat Event.

NOW, THEREFORE, I, GAVIN NEWSOM, Governor of the State of California, in accordance with the authority vested in me by the State Constitution and statutes of the State of California, and in particular, Government Code sections 8567, 8571, and 8627, do hereby issue the following Order to become effective immediately:

IT IS HEREBY ORDERED THAT:

1. In regulations concerning the use of auxiliary engines by ocean-going vessels berthed in California ports, the Extreme Heat Event shall be deemed an "emergency event" under CCR, title 17, section 93118.3, subd. (c)(14).

2. This Order shall be deemed to provide notice to reduce use of grid-based electrical power under CCR, title 17, section 93118.3, subd. (c)(14)(C), and notice under that same section that reduction is no longer necessary at 11:59 p.m. on July 13, 2021. Ships that are berthed at California ports between July 10, 2021 and July 13, 2021 shall not be required to use shore power until after 11:59 pm on July 16, 2021.

3. A ship operating on auxiliary engines pursuant to an "emergency event" under Paragraph 1 of this Order shall be deemed to qualify for an exemption under CCR, title 17, section 93118.3, subd. (d)(1)(E)(1)(a), and any visit occurring during the period described in Paragraph 2 of this Order shall be counted towards compliance under CCR, title 17, section 93118.3, subd. (d)(1)(F)(1).

4. Any permit, regulation or law prohibiting, restricting, or penalizing the use of auxiliary ship engines or other conduct allowed by this Order during the Extreme Heat Event is suspended.

5. This Order shall expire at 11:59 p.m. on July 17, 2021.

IT IS FURTHER ORDERED that, as soon as hereafter possible, this Order be filed in the Office of the Secretary of State and that widespread publicity and notice be given of this Order.

This Order is not intended to, and does not, create any rights or benefits, substantive or procedural, enforceable at law or in equity, against the State of California, its agencies, departments, entities, officers, employees, or any other person.

IN WITNESS WHEREOF I have hereunto set my hand and caused the Great Seal of the State of California to be affixed this 10th day of July 2021.

GAVIN NEWSOM
Governor of California

EXECUTIVE SUMMARY

Senate Bill (SB) 743, signed in 2013, changes the way transportation studies are conducted in California Environmental Quality Act (CEQA) documents. Vehicle miles traveled (VMT) replaces motorist delay and level of service (LOS) as the metric for impact determination. As a result of the final rulemaking surrounding SB 743 and the implementation deadline of July 1, 2020, the City of Fresno is adopting the new VMT thresholds and guidelines to address the shift from delay-based LOS CEQA traffic analyses to VMT CEQA traffic analyses.

This document discusses in further detail the following:

- Definition of region for VMT analysis
- Standardized screening methods for VMT threshold compliance data
- Recommendations for appropriate VMT significance thresholds for development projects, transportation projects, and plans
- Feasible mitigation strategies applicable for development projects, transportation projects, and plans
- For purposes of this analysis, the Fresno Council of Governments (COG) Activity-Based Model (ABM)[1] was used to develop screening maps. The Fresno COG ABM base year was updated from 2014 to 2019 based on consultation with Fresno COG staff. The appropriate use of the ABM for VMT calculations has been further elaborated in subsequent chapters of this document.

This document will serve as a detailed guideline for preparing VMT analysis consistent with SB 743 requirements for development projects, transportation projects, and plans. Project applicants will be required to follow the guidance provided in this document for preparation of CEQA VMT analysis.

1.0 INTRODUCTION

Senate Bill (SB) 743, signed in 2013, changes the way transportation studies are conducted in California Environmental Quality Act (CEQA) documents. Vehicle miles traveled (VMT) replaces motorist delay and level of service (LOS) as the metric for impact determination. For development projects, VMT is simply the product of the daily trips generated by a new development and the distance those trips travel to their destinations. For capital projects, impacts are identified as the new VMT attributable to the added capital project, both from the installation of the facility and the induced growth—a new term in the CEQA lexicon—generated as a result of induced land use.

In January 2019, the Natural Resources Agency and the Governor's Office of Planning and Research (OPR) codified SB 743 into the Public Resources Code (PRC) and the *State CEQA Guidelines*. *State CEQA Guidelines* Section 15064.3 subdivision (b) states:

1. **Land Use Projects.** Vehicle miles traveled exceeding an applicable threshold of significance may indicate a significant impact. Generally, projects within one-half mile of either an existing major transit stop or a stop along an existing high quality transit corridor should be presumed to cause a less than significant transportation impact. Projects that decrease vehicle miles traveled in the project area compared to existing conditions should be presumed to have a less than significant transportation impact.

2. **Transportation Projects.** Transportation projects that reduce, or have no impact on, vehicle miles traveled should be presumed to cause a less than significant transportation impact. For roadway capacity projects, agencies have discretion to determine the appropriate measure of transportation impact consistent with CEQA and other applicable requirements. To the extent that such impacts have already been adequately addressed at a programmatic level, such as in a regional transportation plan EIR, a lead agency may tier from that analysis as provided in Section 15152.

3. **Qualitative Analysis.** If existing models or methods are not available to estimate the vehicle miles traveled for the particular project being considered, a lead agency may analyze the project's vehicle miles traveled qualitatively. Such a qualitative analysis would evaluate factors such as the availability of transit, proximity to other destinations, etc. For many projects, a qualitative analysis of construction traffic may be appropriate.

4. **Methodology.** A lead agency has discretion to choose the most appropriate methodology to evaluate a project's vehicle miles traveled, including whether to express the change in absolute terms, per capita, per household or in any other measure. A lead agency may use models to estimate a project's vehicle miles traveled, and may revise those estimates to reflect professional judgment based on substantial evidence. Any assumptions used to estimate vehicle miles traveled and any revisions to model outputs should be documented and explained in the environmental document prepared for the project. The standard of adequacy in Section 15151 shall apply to the analysis described in this section.

The OPR provides a Technical Advisory (TA) as a guidance document to establish thresholds for this new VMT metric. The laws and rules governing the CEQA process are contained in the CEQA statute

DRAFT

(PRC Section 21000 and following), the *State CEQA Guidelines* (California Code of Regulations, Title 14, Section 15000 and following), published court decisions interpreting CEQA, and locally adopted CEQA procedures. The TA is intended as a reference document; it does not have the weight of law. Yet, deviating from the TA is best undertaken with substantial evidence to support the agency action.

The State of California is committed to reducing greenhouse gas (GHG) emissions and achieving long-term climate change goals. To achieve these climate change goals, California needs to reduce VMT. As illustrated in Figure 1, over the last 40 years, with increase in statewide population, the overall VMT has also increased. As illustrated in Figure 2, transportation is the single largest sector contributing to the State's GHG emissions. More than 40 percent of the GHG emissions come from the transportation sector, primarily passenger cars and light-duty trucks. Reducing the number of vehicle trips and reducing the length of trips are expected to result in reduced VMT and reduced GHG emissions. The new *State CEQA Guidelines* and the establishment of VMT thresholds for CEQA analyses is linked to GHG reduction strategies and overall statewide climate change goals.

Figure 2: 2017 GHG Emissions in California by Scoping Plan Sector and Sub-Sector Category

This document establishes the City of Fresno's (City) threshold of significance for CEQA transportation studies and provides substantial evidence as appropriate. It is divided into chapters, including:

- **Chapter 2 – Definition of Region:** Here the document describes what the comparative is for analysis purposes. Each project will be compared to an existing regional average. The geographical area that defines the region is defined and described.

- **Chapter 3 – Project Screening:** OPR acknowledges that certain projects are either low VMT generators, or by virtue of their location would have a less than significant impact. The City should use these screening criteria and should offer substantial evidence for other circumstances that would lead to a less than significant impact.

- **Chapter 4 – Significance Thresholds for Development Projects:** In this chapter, the threshold that would define a significant CEQA impact is identified. This threshold is linked to a specific travel mode and a set of trip purposes. The actual VMT metric (either an efficiency rate or total VMT) is described.

- **Chapter 5 – Significant Thresholds for Transportation Projects:** This chapter describes the method to evaluate significant CEQA impacts associated with transportation projects. Many non-vehicular capital projects are presumed to have a less than significant impact. Capacity enhancing projects may have significant impacts and may be subject to a detailed analysis that will include measuring induced travel.

- **Chapter 6 – Significance Thresholds for Land Use Plans:** This chapter provides guidance and substantial evidence to support the City's treatment of land use plans and their CEQA transportation analysis.

- **Chapter 7 – Mitigation Strategies:** Potential mitigation strategies are indicated in this chapter. It is noted that this discussion is not intended as a full list of measures the City sanctions as feasible. As in previous CEQA practice, it is generally the practitioner who identifies mitigation measures to offset the specific project related impacts identified in individual environmental document. The discussion here is intended as a reference and guide for possible strategy for applicants who may wish to investigate to offset their specific project-related significant impacts.

DRAFT

2.0 DEFINITION OF REGION: VEHICLE MILES TRAVELED CONTEXT

The question of context is the definition of the scope of the VMT analysis. The common term for this in previous delay-based LOS analyses is ***project study area***. In the delay-based LOS analyses, a project study area is generally determined based on the incremental increase in traffic from the project and its potential to create a significant LOS impact. This generally includes intersections and roadway segments where the project would add a prescribed number of peak-hour trips. Many times, lead agencies stop study area boundaries at their jurisdictional borders.

Unlike delay-based LOS analyses, VMT is a regional effect not defined by roadway, intersection, or pathway. The OPR acknowledges this in its TA (page 6), which states,

> *Lead agencies should not truncate any VMT analysis because of jurisdictional or other boundaries….*

Furthermore, the recommendations for thresholds for the primary land use types (residential and office) are based on a comparison to a ***regional average.*** Region is not defined further in the TA. Instead, the OPR offers the following suggestions:

1. *In cases where the region is substantially larger than the geography over which most workers would be expected to live, it might be appropriate to refer to a smaller geography, such as **county**, that includes the area over which nearly all workers would be expected to live (page 16).*

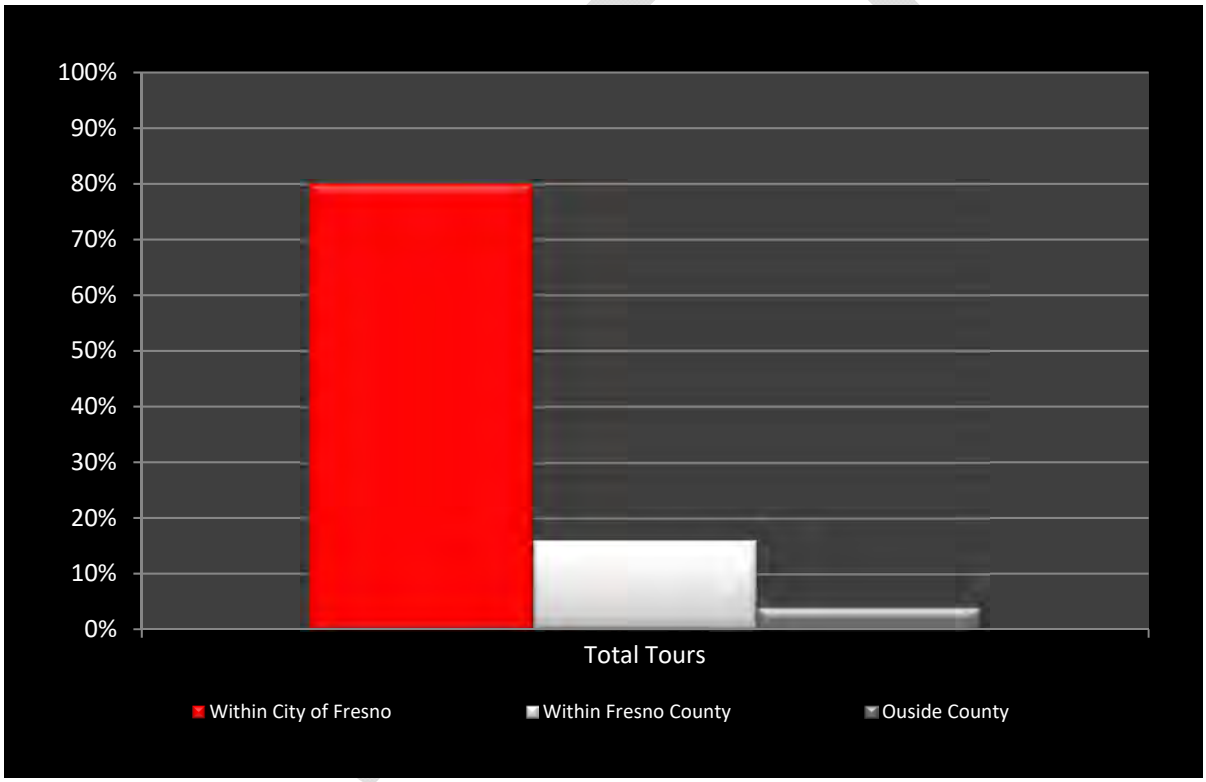
2. *For residential projects in unincorporated county areas, the local agency can compare a residential project's VMT to (1) the region's VMT per capita, or (2) the aggregate population weighted VMT per capita of all cities in the region (page 15).*

LSA surveyed other large urbanized areas around the State to identify what region has been established for VMT thresholds. In most cases, the county boundary has been identified as the region selected for VMT analysis. Mobility can be studied using a trip-based approach or a tour-based approach. The OPR TA states that "where available, tour-based assessment is ideal because it captures travel behavior more comprehensively." Since Fresno COG's model is an ABM, a tour-based approach has been followed. LSA used the Fresno COG ABM to examine the tours into and out of Fresno. As such, consistent with the OPR TA, only tours having origins or destinations or both within the City were considered. External pass-through trips were not considered. As illustrated in Figure 3, out of the total tours, about 80 percent originate and are destined within the city. Another 16 percent of tours originate or are destined within other jurisdictions in Fresno County. The remaining 4 percent home-based tours originate and are destined outside Fresno County.

Because the majority of the tours are contained within Fresno County, the county may be used to define the region. For residential projects, the TA states that "Existing VMT per capita may be measured as regional VMT per capita or as city VMT per capita. Proposed development referencing a threshold based on city VMT per capita (rather than regional VMT per capita) should not

cumulatively exceed the number of units specified in the [Sustainable Communities Strategy] SCS for that city, and should be consistent with the SCS." As such, this analysis evaluated residential VMT per capita for the City using the county as the region as well as the city boundary as the region. As illustrated in Figure 3, 85 percent of the residential trips having origins/destinations within Fresno terminate within Fresno County. Hence, based on this analysis, the City has determined to use the county as the region for all residential projects. Additionally, as illustrated in Figure 3, 90 percent of the employee trips having origins/destinations within Fresno terminate within Fresno County. Therefore, for office, retail, and all other non-residential projects, consistent with the TA, the county will be used as the region. The other OPR guidance recommends consistency in approach; once a region is established, that region should be used for all subsequent traffic analyses.

In some cases, this county boundary has other names, such as the Council of Governments boundary. Nonetheless, county is a common and reoccurring context for CEQA VMT analyses throughout the State.



Source: Fresno COG Activity Based Model

Figure 3: Percentage of Total Tours Having Origins/Destinations within the City of Fresno and Terminating within the City of Fresno, within Fresno County, or outside the County

It should be recognized the use of the county as the region defines the comparative, or the denominator, in the identification of project-related impact. The numerator is the project's VMT contribution. This project-related VMT profile may go beyond the county boundary and not be truncated by a jurisdictional boundary. For example, a new, large employment generating

development proposed near the city's northern boundary may include VMT from as far away as Madera, Tulare, or Kings Counties or other communities in the San Joaquin Valley. In that case, it would be the responsibility of the applicant and their traffic study preparer to include the project VMT regardless of geographical limit to the satisfaction of City staff. This project-related VMT profile would be compared against the County of Fresno regional average.

DRAFT

3.0 PROJECT SCREENING

The TA does acknowledge that certain activities and projects may result in a reduction in VMT and GHG emissions and therefore a less-than-significant impact to transportation and circulation. A variety of projects may be screened out of a complicated VMT analysis due to the presumption described in the TA regarding the occurrence of less-than-significant impacts.

3.1 DEVELOPMENT PROJECTS

The TA acknowledges that conditions may exist that would presume that a development project has a less than significant impact. These may be size, location, proximity to transit, or trip-making potential. For example, development projects that have one or more of the following attributes may be presumed to create a less than significant impact:

- The project is within 0.5 mile (mi) of a Transit Priority Area or a High-Quality Transit Area unless the project is inconsistent with the Regional Transportation Plan (RTP)/SCS, has a floor area ratio (FAR) less than 0.75, provides an excessive amount of parking, or reduces the number of affordable residential units. In accordance with SB 743, "Transit priority areas" are defined as "an area within one-half mile of a major transit stop that is existing or planned, if the planned stop is scheduled to be completed within the planning horizon included in a Transportation Improvement Program. A Major Transit Stop means: "a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service of 15 minutes or less during the morning and afternoon peak commute periods." A High-Quality Transit Area or Corridor is a corridor with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours.

  Figure 4 depicts transit priority areas within Fresno including high-quality transit areas (within 0.5 mile of a major transit stop) served by the Fresno Area Express (FAX) with service intervals of 15 minutes or less. Projects proposed in these areas may be presumed to have a less-than-significant transportation impact unless the project is inconsistent with the RTP/SCS, has an FAR less than 0.75, provides an excessive amount of parking, or reduces the number of affordable residential units.

- The project involves local-serving retail space of less than 50,000 square feet (sf).

- The project has a high level of affordable housing units. The afforable-housing requirement to meet the screening criteria is to be determined by City staff.

- The project generates a low volume of daily traffic.

  The TA recommends a volume of 110 average daily trips (ADT). This recommendation is not based on any analysis of GHG reduction but, rather, on a CEQA categorical exemption. This exemption criterion states that for existing facilities, including additions to existing structures of up to 10,000 sf, the project is exempted from CEQA as long as the project is in an area where public infrastructure is available to allow for maximum planned development and the project is not located in an environmentally sensible area (*State CEQA Guidelines* Section 15301,

DRAFT

subdivision (e)(2). As stated in the OPR TA, for projects that have a linear increase in trip generation with respect to the building footprint, the daily trip generation is anticipated to be between 110 and 124 trips per 10,000 sf. Therefore, based on this assumption, the OPR recommends 110 ADT as the screening threshold. However, the California Emissions Estimator Model (CalEEMod) was used to characterize the effect of changes in project-related ADT to the resulting GHG emissions. This model was selected because it is provided by the CARB to be used statewide for developing project-level GHG emissions. CalEEMod was used with the built-in default trip lengths and types to show the vehicular GHG emissions from incremental amounts of ADT. Table A shows the resulting annual VMT and GHG emissions from the incremental ADT.

Table A: Representative VMT and GHG Emissions from CalEEMod

Average Daily Trips (ADT)	Annual Vehicle Miles Traveled (VMT)	GHG Emissions (Metric Tons CO_2e per year)
200	683,430	258
300	1,021,812	386
400	1,386,416	514
500	1.703,020	643
600	2,043,623	771

Source: CalEEMod version 2016.3.2.
CalEEMod = California Emissions Estimator Model GHG = Greenhouse Gas
CO_2e = carbon dioxide equivalent

A common GHG emissions threshold is 3,000 metric tons (MT) of carbon dioxide equivalent[2] (CO_2e) per year.[3] The vehicle emissions are typically more than 50 percent of the total project GHG emissions. Thus, a project with 500 ADT would generally have total project emissions that could be less than 1,300 MT CO_2e/year (i.e., 50 percent or 643 MT CO_2e/year coming from vehicle emissions and the other 50 percent coming from other project activities). As this level of GHG emissions would be less than 3,000 MT CO_2e/year, the emissions of GHG from a project up to 500 ADT would typically be less than significant. Therefore, the City will allow screening out projects if the project would generate less than 500 ADT.

- The development of institutional/government and public service uses that support community health, safety and welfare may also be screened from subsequent CEQA VMT analysis. These facilities (e.g. police stations, fire stations, community centers, refuse stations) are already part of the community and, as a public service, the VMT is accounted for in the existing regional average. Many of these facilities generate fewer than 500 ADT and/or use vehicles other than passenger-cars or light duty trucks. These other vehicle fleets are subject to regulation outside

[2] Carbon dioxide equivalent (CO_2e) is a concept developed to provide one metric that includes the effects of numerous GHGs. The global warming potential (GWP) of each GHG characterizes the ability of each GHG to trap heat in the atmosphere relative to another GHG. The GWPs of all GHGs are combined to derive the CO_2e.

[3] Source: http://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-analysis-handbook/ghg-significance-thresholds

of CEQA, such as the California Air Resources Board (CARB) and the San Joaquin Valley Air Pollution Control District.

- The TA states "Residential and office projects that are located in areas with low VMT, and that incorporate similar features (i.e., density, mix of uses, transit accessibility), will tend to exhibit similarly low VMT. Maps created with VMT data, for example from a travel survey or a travel demand model, can illustrate areas that are currently below threshold VMT. Because new development in such locations would likely result in a similar level of VMT, such maps may be used to screen out residential and office projects from needing to prepare a detailed VMT analysis." LSA calculated VMT per capita and VMT per employee for the City of Fresno as well as the entire Fresno County. Figure 5 illustrates the comparison of these VMTs. LSA also created screening maps that residential and office projects within the city can use to screen projects. As described earlier, the City will use Fresno County as the region. Therefore, the screening maps have been created using the county as the region. Figure 6 illustrates Fresno's VMT per capita screening map. Figure 7 illustrates the City's VMT per employee screening map. As illustrated in Figures 6 and 7, most of the low VMT zones are in the central part of Fresno, where the City's vision is to promote infill development. Therefore, the VMT thresholds and IDs of these zones will effectively screen out or exempt from further VMT analysis the desired development types the City wishes to see as part of the General Plan process.

DRAFT

- Based on the City's traffic study guidelines or existing CEQA guidelines, other conditions may apply to screen out projects. Consistency with other plans to reduce GHG emissions may also reflect substantial evidence supporting a screening out. Or, the City may adopt the TA recommendations in total.

The Fresno COG VMT Screening Tool[4] can be used to determine whether a development project may be screened from a detailed VMT analysis. It should be noted that if a project constitutes a General Plan Amendment (GPA) or a Zone Change (ZC), none of the above screening criteria may apply. The City will be required to evaluate such projects on a case-by-case basis to determine whether a VMT analysis would be required.

3.2 TRANSPORTATION PROJECTS

The primary attribute to consider with transportation projects is the potential to increase vehicle travel, sometimes referred to as "induced travel." Based on the OPR TA, while the City has discretion to continue to use a delay-based LOS analysis for CEQA disclosure of transportation projects, changes in vehicle travel must also be quantified. The City of Fresno will solely use VMT analysis for CEQA disclosure of transportation projects, but will also require a LOS analysis for design, traffic operations, and safety purposes. The TA lists a series of projects that would not likely lead to a substantial or measurable increase in vehicle travel and which would, therefore, not require an induced travel analysis. These include the following:

- Rehabilitation, maintenance, replacement, safety, and repair projects designed to improve the condition of existing transportation assets (e.g., highways; roadways; bridges; culverts; Transportation Management System field elements such as cameras, message signs, detection, or signals; tunnels; transit systems; and assets that serve bicycle and pedestrian facilities) and that do not add additional motor vehicle capacity
- Roadside safety devices or hardware installation such median barriers and guardrails
- Roadway shoulder enhancements to provide "breakdown space," dedicated space for use only by transit vehicles, to provide bicycle access, or to otherwise improve safety, but which will not be used as automobile vehicle travel lanes
- Addition of an auxiliary lane of less than 1 mi in length designed to improve roadway safety
- Installation, removal, or reconfiguration of traffic lanes that are not for through traffic, such as left-, right-, and U-turn pockets, two-way left-turn lanes, or emergency breakdown lanes that are not utilized as through lanes
- Addition of roadway capacity on local or collector streets, provided the project also substantially improves conditions for pedestrians, cyclists, and, if applicable, transit
- Conversion of existing general-purpose lanes (including ramps) to managed lanes or transit lanes, or changing lane management in a manner that would not substantially increase vehicle travel

[4] Fresno COG VMT Screening Tool Link: http://gis.lsa-assoc.com/FCOGVMT/

- Addition of a new lane that is permanently restricted to use only by transit vehicles
- Reduction in the number of through lanes
- Grade separation to separate vehicles from rail, transit, pedestrians, or bicycles, or to replace a lane in order to separate preferential vehicles (e.g., high-occupancy vehicles [HOVs], high-occupancy toll [HOT] lane traffic, or trucks) from general vehicles
- Installation, removal, or reconfiguration of traffic control devices, including Transit Signal Priority features
- Installation of traffic metering systems, detection systems, cameras, changeable message signs, and other electronics designed to optimize vehicle, bicycle, or pedestrian flow
- Timing of signals to optimize vehicle, bicycle, or pedestrian flow
- Installation of roundabouts or traffic circles
- Installation or reconfiguration of traffic calming devices
- Adoption of or increase in tolls
- Addition of tolled lanes, where tolls are sufficient to mitigate VMT increase
- Initiation of a new transit service
- Conversion of streets from one-way to two-way operation with no net increase in the number of traffic lanes
- Removal or relocation of off-street or on-street parking spaces
- Adoption or modification of on-street parking or loading restrictions (including meters, time limits, accessible spaces, and preferential/reserved parking permit programs)
- Addition of traffic wayfinding signage
- Rehabilitation and maintenance projects that do not add motor vehicle capacity
- Addition of new or enhanced bike or pedestrian facilities on existing streets/highways or within existing public rights-of-way
- Addition of Class I bike paths, trails, multi-use paths, or other off-road facilities that serve nonmotorized travel
- Installation of publicly available alternative fuel/charging infrastructure
- Addition of passing lanes, truck climbing lanes, or truck brake-check lanes in rural areas that do not increase overall vehicle capacity along the corridor

DRAFT

Additionally, transit and active transportation projects generally reduce VMT and, therefore, may be presumed to cause a less than significant impact on transportation. This presumption may apply to all passenger rail projects, bus and bus rapid-transit projects, and bicycle and pedestrian infrastructure projects. The City may use this CEQA presumption of less than significant impact to aid in the prioritization of capital projects, as the CEQA process for any of these project types would be more streamlined than other capacity-enhancing capital projects.

DRAFT

4.0 SIGNIFICANCE THRESHOLDS FOR DEVELOPMENT PROJECTS

The TA states that SB 743 and all CEQA VMT transportation analyses refer to automobiles. Here, the term automobile refers to on-road passenger vehicles, specifically cars and light duty trucks (page. 4). Heavy-duty trucks can be addressed in other CEQA sections (air quality, greenhouse gas, noise, and health risk assessment analysis) and are subject to regulation in a separate collection of rules under CARB jurisdiction. This approach was amplified by Chris Ganson, Senior Advisor for Transportation at OPR, in a recent presentation at the Fresno COG (October 23, 2019) and by Ellen Greenberg, the California Department of Transportation (Caltrans) Deputy Director for Sustainability, at the San Joaquin Valley Regional Planning Agencies' Directors' Committee meeting (January 9, 2020).

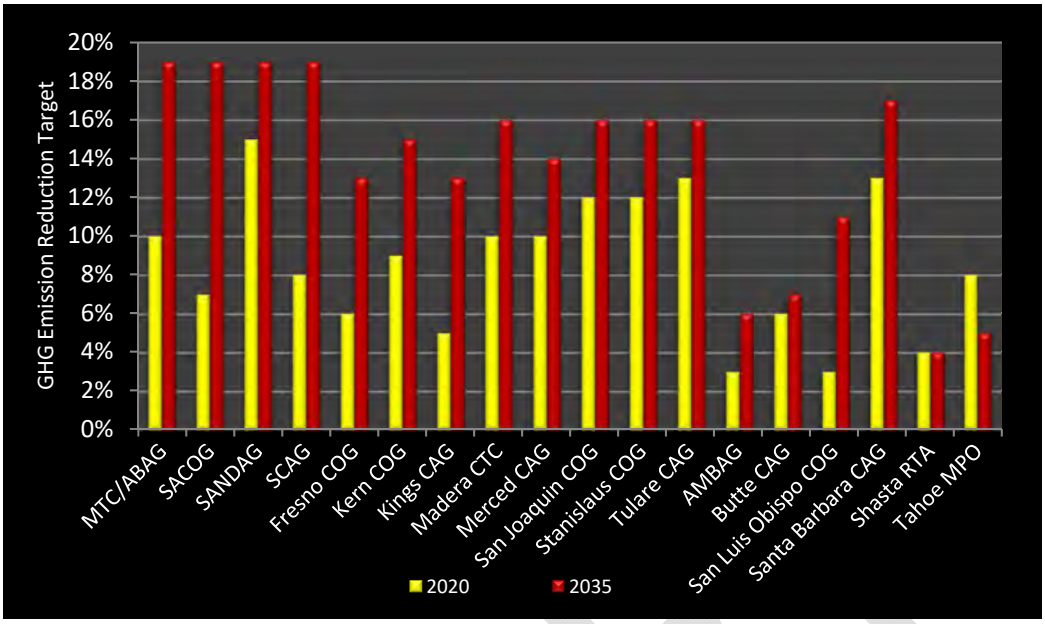
The OPR has identified the subject of the thresholds as the primary trips in the home-based typology: specifically, home-based work tours. This includes residential uses, office uses, and retail uses. The home-based work tour type is the primary tourmaking during the peak hours of commuter traffic in the morning and evening periods.

The impact of transportation has shifted from congestion to climate change, and the purpose of the CEQA analysis is to disclose and ultimately reduce GHG emissions by reducing the number and length of automobile trips. As part of the SB 375 land use/transportation integration process and the GHG goal setting, the State and Regional Transportation Planning Agencies (RTPA) have agreed to reduce GHG through integrated land use and transportation planning by a statewide average of approximately 15 percent by 2035. Figure 8 illustrates the SB 375 regional GHG emission reduction targets for all the 18 Metropolitan Planning Organizations (MPOs) in California that was established by the CARB in 2018. Furthermore, in its 2017 Scoping Plan-Identified VMT Reductions and Relationship to State Climate Goals, the CARB recommends total VMT per capita rates approximately 15 percent below existing conditions.

The TA therefore recommends:

> *A proposed (residential) project exceeding a level of 15 percent below existing regional average VMT per capita may indicate a significant transportation impact.*
>
> *A similar threshold would apply to office projects (15 percent below existing regional average VMT per employee).*
>
> *VMT generated by retail projects would indicate a significant impact for any net increase in total VMT.*

DRAFT



Source: https://ww2.arb.ca.gov/our-work/programs/sustainable-communities-program/regional-plan-targets

Figure 8: SB 375 Regional Plan Climate Targets for the 18 California MPOs

It is noted that the aggregate GHG emission reduction sought after by CARB in the SB 375 protocols is 15 percent statewide. This is one reason OPR believes the 15 percent reduction in VMT is appropriate. The aggregate 15 percent GHG emission reduction applies across all land use and transportation activities and would indicate that the State and its individual MPOs are compliant with the SB 375 goals, the overall State climate change strategy, and Scoping Plan objectives.

CARB establishes GHG targets for each of the 18 MPOs in the State, reviews the SCSs and makes a determination whether the SCS would be able to achieve GHG reduction targets if implemented. Fresno COG's 2018 RTP/SCS demonstrated a GHG reduction of 10 percent by 2035 through the integrated land use and transportation initiatives and capital projects listing, which meets targets set by the CARB. Fresno COG's 2018 RTP/SCS was approved by all reviewing Federal and State authorities, including the CARB. In the spring of 2018, CARB adopted new GHG targets for all the 18 MPOs in the State based on the 2017 Scoping Plan and other new data. CARB established a 13 percent GHG reduction target for 2035 for the Fresno region's third RTP/SCS. The State of California recognizes Fresno County's contribution to the aggregate 15 percent statewide GHG emission reduction is 13 percent. Other regions may achieve greater reductions to achieve the aggregate statewide goal.[5] As such, reduction in GHG directly corresponds to reduction in VMT. In order to reach the statewide GHG reduction goal of 15 percent, the City must reduce GHG by 13 percent. The method of reducing GHG by 13 percent is to reduce VMT by 13 percent as well.

[5] The latest GHG targets by region can be found at: https://ww2.arb.ca.gov/our-work/programs/sustainable-communities-program/regional-plan-targets.

Therefore, the City has established a threshold for land use developments, specifically residential and office, of 13 percent or more than the existing regional VMT per capita as indicative of a significant environmental impact.

No other discrete land use types are identified for threshold development. Mixed-use projects should be evaluated for each component of the project independently, or the City may use the predominant land use type for the analysis. The City will make a determination of the predominant land use type on a case-by-case basis based on the project description. Credit for internal trip capture should be made. Internal trip capture may be calculated using the latest edition of the Institute of Transportation Engineers (ITE) *Trip Generation Handbook* (for smaller projects), the Fresno COG ABM (for larger projects), or other applicable sources approved by the City. The TA suggests that City may, but is not required to, develop thresholds for any other use.

One approach is to review the City's General Plan and/or the Fresno COG RTP/SCS and identify whether the implementation of the plan would result in a reduction of VMT and GHGs. If it does, the City may conclude the implementation of the plan, including all the other land use types will achieve the regional climate change goals. Therefore, consistency with the plan and no net change in VMT per employee for the other land use types is a rational threshold. However, for projects seeking a GPA, a project exceeding a level of 13 percent than the existing County average VMT per employee would indicate a significant transportation impact.

This approach would require disclosure of substantial evidence, including the General Plan findings, and other supporting traffic and air quality forecasting support. Additionally, if the City wishes to establish some other threshold less stringent than the 13 percent recommended for residential and office projects, a body of substantial evidence would be necessary.

Figure 9 demonstrates the potential development entitlement process to comply with the *State CEQA Guidelines* related to VMT and transportation impacts. It provides the path from application filing through determination of impacts. It is presented as the standard process; each development application is considered unique and may create alternative or modified steps through the process. Each step that diverges from this standard process should be accompanied with substantial evidence demonstrating compliance with other climate change and GHG emission reduction laws and regulations.

4.1 GENERAL TRANSPORTATION ANALYSIS PROCEDURE

This process will be refined as the new VMT analysis process is implemented. At the outset of the project development process, the applicant should seek a meeting with City staff to discuss the project description, the transportation study content, and the analysis methodology. Key elements to address include a description of the project in sufficient detail to generate trips and identify the potential catchment area (i.e., trip lengths if no modeling is undertaken), estimate project VMT, discuss project design features that may reduce the VMT from the project development, and discuss the project location and associated existing regional VMT percentages. As a result of the meeting, the applicant or their consultant shall prepare a transportation analysis scope of work for review and approval by the City.

DRAFT

Projects that will influence Caltrans facilities may be subject to the Caltrans Local Development-Intergovernmental Review program. As part of the program, Caltrans may review the VMT analysis methodology, findings, and mitigation measures, with an eye toward statewide consistency.

4.2 PROJECT SCREENING

Once a development application is filed and the meeting is held, project screening is conducted as the initial step. If the project meets any one of the screening criteria, the project may be presumed to create a less than significant impact. No further VMT analysis is necessary. The CEQA document should enumerate the screening criteria and how the project meets or exceeds that threshold. If project screening does not apply, a VMT analysis may be required. The extent of this analysis may be a simple algebraic demonstration or a more sophisticated traffic modeling exercise. This distinction is addressed later.

4.3 PROJECT VEHICLE MILES TRAVELED ANALYSIS

The first step is to identify the project land use type and the appropriate metric to use, i.e., VMT per capita, VMT per employee, or total VMT. The metric should be VMT per capita for residential projects, VMT per employee for office projects, and total VMT for retail projects. For mixed-use projects, after taking credit for internal trip capture, the project VMT can be estimated based on each component of the project independently, or the City may use the predominant land use type for the analysis. For all other uses, the metric used should be VMT per employee.

4.3.1 Small Project Vehicle Miles Traveled Analysis

Project VMT may be calculated using the Fresno COG VMT Calculation Tool[6] for residential projects having less than or equal to 500 dwelling units or office projects having less than or equal to 375 employees. For all other projects, trip lengths can be determined using the Fresno COG ABM.

4.3.2 Large Project Vehicle Miles Traveled Analysis

For large or multi-use projects, use of the Fresno COG ABM is required. For purposes of City review, all projects, other than residential uses with less than or equal to 500 dwelling units or offices with less than or equal to 375 employees, should use the Fresno COG ABM. At this level of trip generation, the probability of trip fulfilment expands to an area greater than the immediate project location and may include a greater regional attraction. The Fresno COG ABM can more accurately define the select links used and the total VMT generated by the project.

Next, the project generated VMT per capita/VMT per employee/total VMT is compared to the appropriate significance threshold. This is either equal to or more than 13 percent of the existing regional average per capita or employment for specific uses, or no net increase in total VMT for retail or other uses that are consistent with the General Plan. For those projects that require a GPA, a threshold of 13 percent or more than existing regional average is appropriate as the project has yet to be evaluated as part of the City's ultimate development vision.

[6] Fresno COG VMT Calculation Tool Link: Link Forthcoming

If the project VMT metric is less than the significance threshold, the project is presumed to create a less than significant impact. No further VMT analysis is required. If the project is greater than the significance threshold, mitigation measures are required.

4.4 MITIGATION MEASURES

The applicant is required, per CEQA, to identify feasible offsets to completely mitigate the impact created by the project. These can come from the mitigation strategies provided by the City (Appendices A and B), or selected based on the applicant and their CEQA team experience. The City must approve and accept the ultimate mitigation ascribed to the project and the related VMT percentage reduction.

If the mitigation measures mitigate the project impact to less than the jurisdictional threshold, the project is presumed to have an impact mitigated to a less than significant level. No further VMT analysis is required. If the project's VMT impact cannot be mitigated, the City may 1) request the project be redesigned, relocated or realigned to reduce the VMT impact, or 2) require the preparation of an Environmental Impact Report (EIR) with a Statement of Overriding Considerations (SOC) for the transportation impacts associated with the project. All feasible mitigation measures must be assigned to and carried out by the project even if an EIR/SOC is prepared.

5.0 SIGNIFICANCE THRESHOLDS FOR TRANSPORTATION PROJECTS

The 2020 CEQA Guidelines include Section 15064.3.b.(2) to address transportation projects. It reads:

> *For roadway capacity projects, agencies have the discretion to determine the appropriate measure of transportation impact consistent with CEQA and other applicable requirements.*

The City may continue to use delay and LOS for transportation projects for design and traffic operation purposes as long as impacts related to "other applicable requirements" are disclosed. This has generally been interpreted as VMT impacts and other State climate change objectives. These other applicable requirements may be found in other parts of an environmental document (i.e., air quality, GHG), or may be provided in greater detail in the transportation section.

For projects on the State highway system, the Caltrans will use and will require sponsoring agencies to use VMT as the CEQA metric, and Caltrans will evaluate the VMT "attributable to the project" (Caltrans Draft VMT-Focused Transportation Impact Study Guide 2020). Caltrans may review environmental documents for capacity-enhancing projects for the City's analysis of VMT change.

The assessment of a transportation project's VMT should disclose the VMT without the project and the difference in VMT with the project. Any growth in VMT attributable to the transportation project would result in a significant impact.

The primary difference in these two scenarios to OPR is related to induced growth. Current traffic models have limited abilities to forecast induced growth, as their land use or socioeconomic databases are fixed to a horizon date. OPR refers to a limited set of reports that would indicate elasticities.

The most recent major study (Duranton & Turner 2011, p. 24), estimates an elasticity of 1.0, meaning that every 1 percent change in lane miles results in a 1 percent increase in VMT.

The TA presents one method to identify the induced growth, as follows.

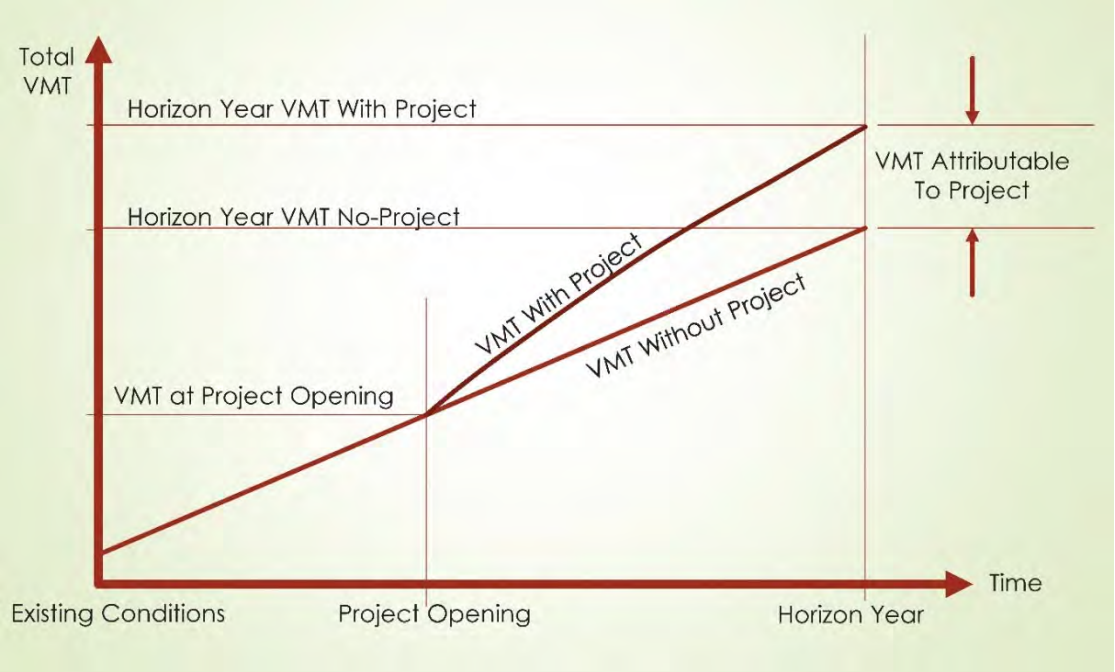
> *To estimate VMT impacts from roadway expansion projects:*
>
> 1. *Determine the total lane-miles over an area that fully captures travel behavior changes resulting from the project (generally the region, but for projects affecting interregional travel look at all affected regions).*
>
> 2. *Determine the percentage change in total lane miles that will result from the project.*
>
> 3. *Determine the total existing VMT over that same area.*

DRAFT

4. *Multiply the percentage increase in lane miles by the existing VMT, and then multiply that by the elasticity from the induced travel literature:*

[% increase in lane miles] x [existing VMT] x [elasticity] =
[VMT resulting from the project]

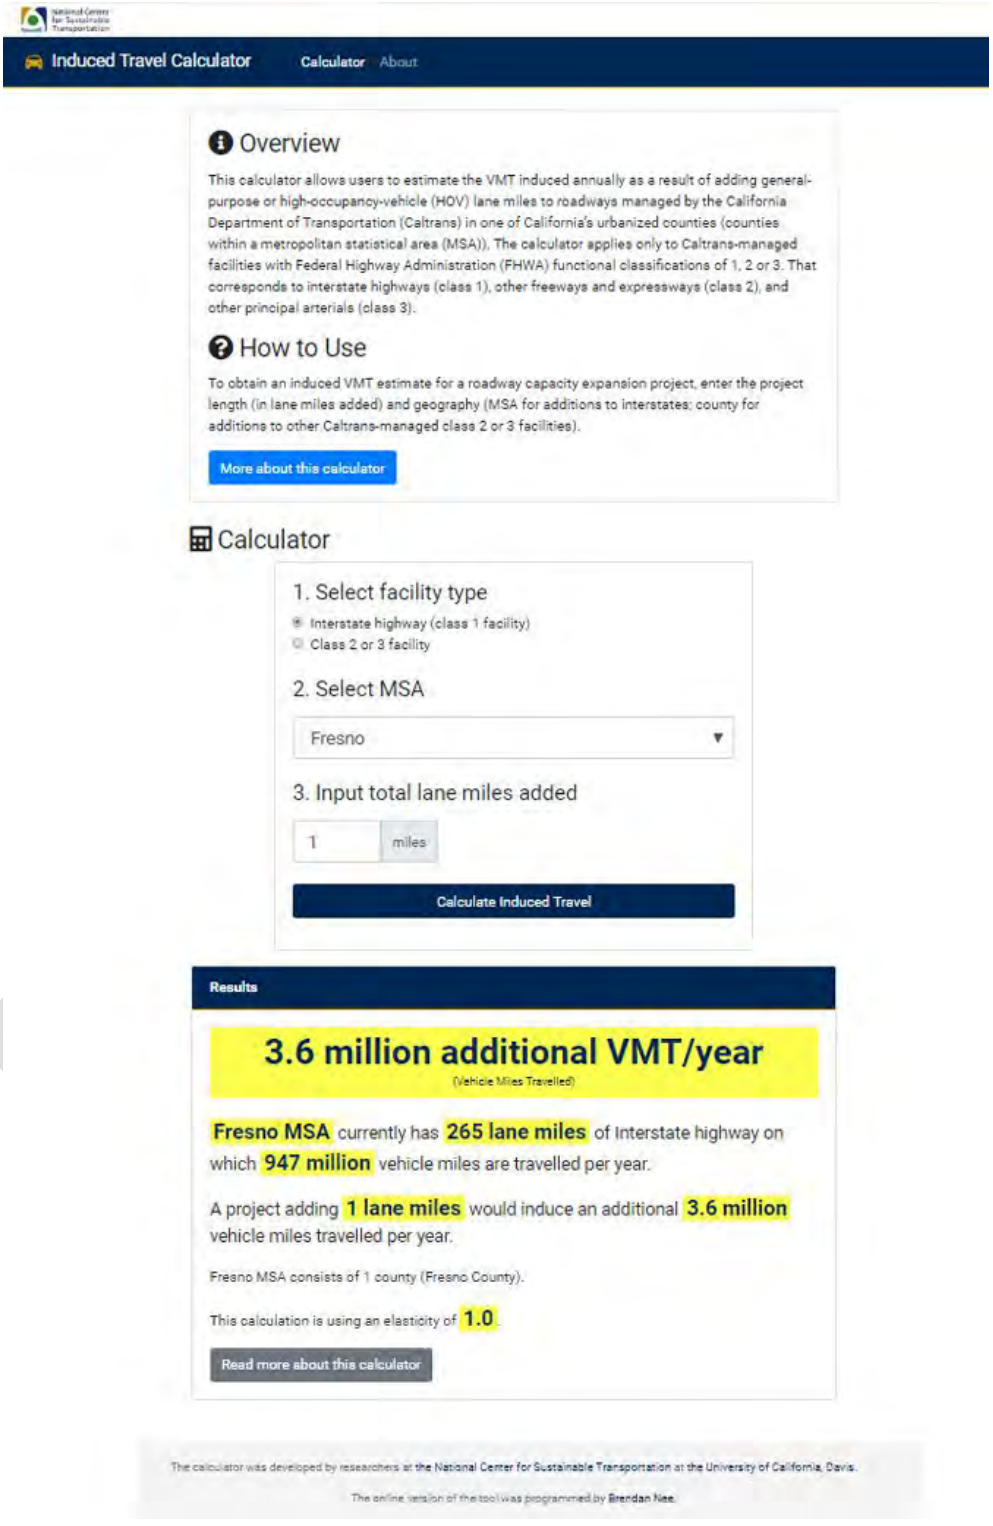
Figure 10 provides a representative illustration of induced VMT attributable to a project.



Source: Presentation: Caltrans Transportation Analysis under CEQA or TAC: Significance Determinations for Induced Travel Analysis (SHCC Pre-Release Session 2 Jeremy Ketchum, Division of Environmental Analysis, Caltrans; March 2, 2020)

Figure 10: Induced Travel – VMT Attributable to Project

Caltrans has identified a computerized tool that estimates VMT generation from transportation projects. It was developed at University of California, Davis and is based on elasticities and the relationship of lane mile additions and growth in VMT. It uses Federal Highways Administration definitions of facility type and ascribes VMT increases to each facility. Output includes increases on million miles of VMT per year. Caltrans is investigating its use for all its VMT analyses of capital projects on the State Highway System. Figure 11 provides an illustration of that tool.



Source: https://blinktag.com/induced-travel-calculator/index.html

Figure 11: Caltrans Induced Travel Calculator

The TA provides other options to identify induced growth- and project-related VMT. These include:

1. Employ an expert panel. *An expert panel could assess changes to land use development that would likely result from the project. This assessment could then be analyzed by the travel demand model to assess effects on vehicle travel. Induced vehicle travel assessed via this approach should be verified using elasticities found in the academic literature.*

2. Adjust model results to align with the empirical research. *If the travel demand model analysis is performed without incorporating projected land use changes resulting from the project, the assessed vehicle travel should be adjusted upward to account for those land use changes. The assessed VMT after adjustment should fall within the range found in the academic literature.*

3. Employ a land use model, running it iteratively with a travel demand model. *A land use model can be used to estimate the land use effects of a roadway capacity increase, and the traffic patterns that result from the land use change can then be fed back into the travel demand model. The land use model and travel demand model can be iterated to produce an accurate result.*

The TA provides a final warning:

> *Whenever employing a travel demand model to assess induced vehicle travel, any limitation or known lack of sensitivity in the analysis that might cause substantial errors in the VMT estimate (for example, model insensitivity to one of the components of induced VMT described above) should be disclosed and characterized, and a description should be provided on how it could influence the analysis results. A discussion of the potential error or bias should be carried into analyses that rely on the VMT analysis, such as greenhouse gas emissions, air quality, energy, and noise.*

Fresno COG ran a few test scenarios of roadway widening projects using the Fresno COG ABM. These results were compared with the results from the Caltrans Induced Travel Calculator. The comparison demonstrated substantial difference in results. As such, it was identified that the ABM was more sensitive to project location, roadway type, surrounding land uses, and localized trip characteristics. Therefore, for most transportation projects that are not under Caltrans jurisdiction, it is recommended that the Fresno COG ABM be utilized to calculate project related induced VMT. As illustrated in Figure 10, VMT attributable to the project must be calculated by evaluating no project and with project conditions under the horizon year scenario using Fresno COG ABM. Net increase in induced VMT will result in a significant impact for the proposed project.

The concept of induced demand and the methodology to be followed is explained in greater detail in the Technical Appendices. Figure 12 illustrates a conceptual overview of the methodology to be followed to calculate induced demand. As illustrated in Figure 12, the effect of induced VMT will be required to be evaluated from both a land use and a travel demand modeling perspective. Fresno COG staff and the Resource Systems Group, Inc. (RSG) have prepared a detailed process that needs

DRAFT

to be conducted for this analysis. The methodology looks at induced VMT from new land uses generated by transportation capacity improvement projects by providing iterative and incremental feedback between the Fresno COG ABM and the land-use growth allocation model such that changes in the traffic network are incorporated into land-use allocation, and vice-versa. The methodology then looks at the impact of increased roadway capacity on increased traffic volumes and congestion using DaySim, the activity-based model component of the Fresno COG ABM. The methodology concludes that roadway capacity increase may lead to increased volumes, which results in increased congestion, which could be close to or the same as the congestion before the roadway capacity increase, albeit with more vehicles and an overall increase in utility.

CEQA Guidelines for Vehicle Miles Traveled Thresholds

Conceptual Methodology for Calculating Induced Demand for Transportation Projects

SOURCE: Fresno Council of Governments

I:\FCG1901\Reports\Traffic\fig13_InducedVMTMethodology_05-28-2020.ai (05/28/2020)

6.0 SIGNIFICANCE THRESHOLDS FOR LAND USE PLANS

The OPR guidance has provided guidance on the treatment of CEQA traffic analyses for land use plans in the TA. The TA reiterates previous direction regarding individual land use assessments:

- Analyze the VMT outcomes over the full area over which the plan may substantively affect travel patterns (the definition of region).

- VMT should be counted in full rather than split between origins and destinations (the full impact of the project VMT).

The TA provides a single sentence as consideration for land use plans. It states, "A general plan, area plan, or community plan may have a significant impact on transportation if proposed new residential, office or retail land uses would in aggregate exceed the respective thresholds recommended above." This recommendation refers to a threshold of 13 percent or more than the existing regional average for residential and office uses and no net gain for retail land uses.

To assess a land use plan, use of a traffic-forecasting tool is recommended. Therefore, the City should use the ABM to assess VMT for land use plans. The total VMT for the plan should be identified for all tour types and all potential VMT contributors within the plan area. Model runs should be conducted for the existing base year and the horizon year with project (plan).

The SB 375 process establishes ambitious and achievable GHG reduction targets for the 18 MPOs in the State. The achievements of the targets are provided through the integration of land use planning and transportation planning, not solely through the imposition of regulation on passenger cars and light-duty trucks. The CARB reviews the SCS and the strategies and programs that the regional agencies put in place in the SCS to achieve the GHG reduction. The CARB approved the new GHG reduction targets for all the 18 MPOs in the State in the spring of 2018. The 2018 targets are applicable to the third SCSes for the MPOs.

Other legislative mandates and State policies speak to GHG reduction targets. A sample of these include:

- Assembly Bill 32 (2006) requires statewide GHG emissions reductions to 1990 levels by 2020 and continued reductions beyond 2020.

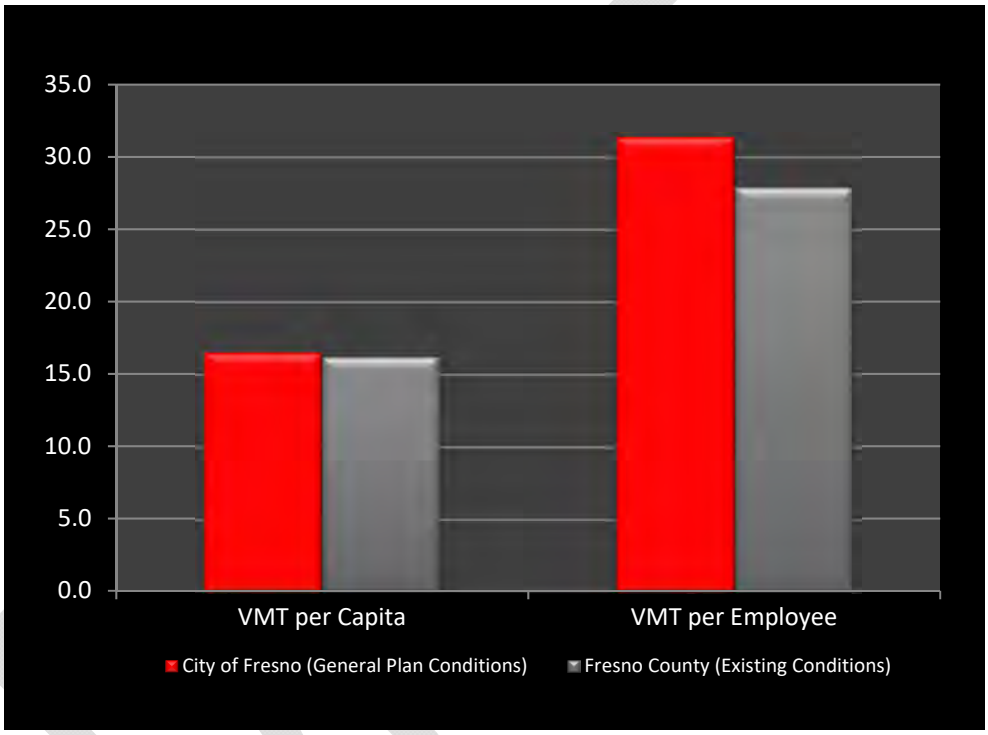
- SB 32 (2016) requires at least a 40 percent reduction in GHG emissions from 1990 levels by 2030.

- Executive Order (EO) B-30-15 (2015) sets a GHG emissions reduction target of 40 percent below 1990 levels by 2030.

- EO S-3-05 (2005) sets a GHG emissions reduction target of 80 percent below 1990 levels by 2050.

- EO B-16-12 (2012) specifies a GHG emissions reduction target of 80 percent below 1990 levels by 2050 specifically for transportation.

Therefore, the recommended methodology for conducting VMT assessments for land use plans is to compare the existing VMT per capita and/or VMT per employee for the region with the expected horizon year VMT per capita and/or VMT per employee for the land use plan. If there is a net increase in the VMT metric under horizon year conditions, then the project will have a significant impact. Figure 13 illustrates the comparison of VMT per capita and VMT per employee under the horizon year for the City of Fresno General Plan compared to the existing regional VMT per capita and existing VMT per employee, respectively.



Source: Fresno COG Activity Based Model

Figure 13: VMT per Capita and VMT per Employee Comparisons – City of Fresno General Plan versus Fresno County under Existing Conditions

7.0 MITIGATION STRATEGIES

When a lead agency identifies a significant CEQA impact according to the thresholds described above, the agency must identify feasible mitigation measures in order to avoid or substantially reduce that impact. Although previous LOS impacts could be mitigated with location-specific LOS improvements, VMT impacts will require mitigation of regional impacts through more behavioral changes. Enforcement of mitigation measures will be still be subject to the mitigation monitoring requirements of CEQA, as well as the regular police powers of the agency. These measures can also be incorporated as a part of plans, policies, regulations, or project designs.

7.1 DEFINITION OF MITIGATION

Section 15370 of the *2020 State CEQA Guidelines* defines mitigations as follows:

> *"Mitigation" includes:*
>
> *a. Avoiding the impact altogether by not taking a certain action or parts of an action.*
>
> *b. Minimizing impacts by limiting the degree or magnitude of the action and its implementation.*
>
> *c. Rectifying the impact by repairing, rehabilitating, or restoring the impacted environment.*
>
> *d. Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.*
>
> *e. Compensating for the impact by replacing or providing substitute resources or environments, including through permanent protection of such resources in the form of conservation easements.*

Section 15097 of the *State CEQA Guidelines* states that "the public agency shall adopt a program for monitoring or reporting on the revisions which it has required in the project and the measures it has imposed to mitigate or avoid significant environmental effects."

VMT mitigations may not be physical improvements; rather, they are complex in nature and will significantly depend on changes in human behavior. Therefore, it will be important that the City develop a proper monitoring program to ensure the implementation of these mitigation measures, throughout the life of a project, in compliance with CEQA. The City must also coordinate with other responsible agencies as part of this monitoring program to determine the feasibility of the mitigations and whether they would last in perpetuity.

Historically, mitigation measures for LOS based transportation impacts have addressed either trip generation reductions or traffic-flow-capacity enhancements. LOS mitigation measures include adding capacity to intersections, roadways, ramps, and freeways. However, transportation demand

DRAFT

management (TDM) actions, active transportation amenities, and other measures to reduce the number of trips creating an impact are also possible mitigation strategies.

LOS based mitigations are mostly physical improvements whose benefits are observable, measurable, and virtually perpetual. The addition of a left-turn lane at an intersection will behave similarly regardless of location and will continue to perform as intended until the lane is removed or modified. A lane mile of roadway will carry a similar volume of traffic if designed consistently across most jurisdictions in California, and it will continue to do so as long as the lane exists.

The definition of VMT mitigation measures is somewhat different. Most VMT mitigations may seem feasible from a theoretical perspective, but practical implementation of these strategies as formal CEQA mitigation measures in perpetuity is yet to be tested. Several of these mitigations are contextual and behavioral in nature. Their success will depend on the size and location of the project as well as expected changes in human behavior. For example, a project providing a bike share program does not necessarily guarantee a behavioral change within the project's population; the level of improvement may be uncertain and subject to the whim of the population affected.

LOS mitigations (such as addition of turn lanes) focus more on rectifying a physical CEQA impact (strategy "c" of *State CEQA Guidelines* Section 15370). On the contrary, the majority of VMT mitigations (such as commute trip-reduction programs) will aim at reducing or eliminating an impact over time through preservation and monitoring over the life of the project (strategy "d" of *State CEQA Guidelines* Section 15370). Additionally, some VMT mitigations (such as those focused on land use/location-based policies) will aim at minimizing impacts by reducing the number of trips generated by the projects (strategy "b" of *State CEQA Guidelines* Section 15370).

Furthermore, it may be that identified VMT impacts cannot be mitigated at the project-specific level. Most VMT impacts are in the context of the region of analysis. The incremental change in VMT associated with a project in the particular setting in which it may be located would suggest a greater VMT deficit than individual strategies can offset. Only a regional solution (e.g., completion of a transit system, purchase of more transit buses, or gap closure of an entire bicycle master plan system) may offer the incremental change necessary to reduce the VMT impact to a level of insignificance. Also, VMT, as a proxy for GHG emissions, may not require locational specificity. A project does not necessarily need to diminish the VMT at the project site to gain benefit in VMT and GHG reduction in the State. Offsets in an area where the benefit would be greater will have a more effective reduction in VMT and GHG and contribute to the State's ultimate climate goals. This is the basis for the cap-and-trade strategies.

These issues of regional scale, partial participation, and geographic ambiguity confound the certainty of the City's identification of VMT mitigation measures. Section 15126.4 of the *State CEQA Guidelines* states, "Where several measures are available to mitigate an impact, each should be discussed and the basis for selecting a particular measure should be identified. **Formulation of mitigation measures shall not be deferred until some future time** [emphasis added]." Certainty does not yet exist that partial participation in VMT mitigation measures is permissible. Regional VMT mitigation is considered the most effective method for large-scale VMT reduction, yet the cost and implementation barriers are greater in most cases than one project can undertake. The only

DRAFT

exception may be where VMT mitigation strategies are provided at a regional level in the form of mitigation banks, fees, and exchanges and the projects are subject to contribute to these fee programs consistent with applicable provision to ensure compliance and consistency with CEQA and other legal requirements.

Section 21099 (b) (4) of the PRC states, "This subdivision [requiring a new transportation metric under CEQA] does not preclude the application of local general plan policies, zoning codes, conditions of approval, thresholds, or any other planning requirements pursuant to the police power or any other authority." Hence, despite the fact that automobile delay will no longer be considered a significant impact under CEQA, the City can still require projects to meet the LOS standards designated in its zoning code or general plan. Therefore, in that case, the project might still be required to propose LOS improvements for congestion relief in addition to VMT strategies as CEQA mitigation measures.

7.2 MITIGATION MEASURES AND PROJECT ALTERNATIVES

7.2.1 Development Projects and Community/General Plans

Source: https://abc30.com/3126364/

Bus Rapid Transit in the City of Fresno

Mitigations and project alternatives for VMT impacts have been suggested by the OPR and are included in the TA. VMT mitigations can be extremely diverse and can be classified under several categories such as land use/location, road pricing, transit improvements, commute trip reduction strategies, and parking pricing/policy. However, the issue with VMT mitigations is the quantitative measurement of the relief provided by the strategies. How much VMT reduction does a TDM program, a bike share program, a transit route, or 1 mile of sidewalk provide? Improvements related to VMT reduction strategies have been quantified in sources such as the California Air Pollution Control Officers Association (CAPCOA) report *Quantifying Greenhouse Gas Mitigation Measures* (CAPCOA Green Book) and CARB sources, and are generally presented in wide ranges of potential VMT reduction percentages.

Appendix A is a summary of the different VMT mitigation measures and project alternatives stated in the CAPCOA Green Book (only those strategies directly attributed to transportation) and the OPR TA for development projects. It also refers to mitigation measures listed in other sources such as the VMT Measurement Calculator for the City of Los Angeles, the transportation analysis guidelines for the City of San Jose and the San Diego Region, and the memorandum Analysis of VMT Mitigation Measures Pursuant to SB 743, prepared by Iteris, Inc., for the Los Angeles County Metropolitan Transportation Authority.

DRAFT

Appendix B provides a list of mitigations for development projects based on the research work performed by Deborah Salon, Marlon G. Boarnet, Susan Handy, Steven Spears, and Gil Tal with the support of CARB. For a few mitigation measures, Fresno COG staff conducted additional research as applicable to the Fresno COG region using the Fresno COG ABM and locally available empirical data. Based on that analysis, specific VMT reduction percentages were developed for these mitigation measures. A detailed description of this analysis is provided in the *Fresno County SB 743 Implementation Regional Guidelines.* The City recommends applying these values to provide project-related mitigations. For all other mitigation measures, the project applicant will be required to provide substantial evidence while identifying a project-specific value. In case that information is not available, consistent with the Fresno COG's recommendations, the project should apply the low point of provided ranges for VMT reduction. Where a mitigation strategy does not have an identified VMT reduction range, the project applicant would be required to provide a reduction estimate supported by evidence.

Bike Routes in the City of Fresno

As for land use plans, the potential mitigation measures for community/general plans would be similar to those for development projects, with certain modifications. The OPR TA does not specifically state any VMT mitigations for land use plans. However, the transportation impact study guidelines for the San Diego Region list potential mitigation measures. These measures have been summarized in Appendix C along with corresponding VMT reduction percentages obtained from CAPCOA.

It must be noted that Appendices A–C provide only summaries of the mitigations stated in the sources mentioned above. The reader should refer to the original source for further details and for subsequent updates to the mitigation measures. Also, Appendices A–C do not provide an exhaustive list of mitigation measures to offset the CEQA impacts. Other measures can also be accepted by the City based on provision of substantial evidence.

As additional mitigation measures are developed to offset VMT impacts in the future for the *State CEQA Guidelines* process, linkages between the strategy and the incremental effect and quantified offset must be made. This can be based on other sources' observations and measurements or the City's experience in these practices. The key to mitigation is to base its efficacy on real and substantial evidence.

7.2.2 Transportation Projects

Although OPR provides detailed guidance on how to assess induced-growth impacts associated with transportation projects, it leaves the subject of mitigation measures vague. Only four strategies are suggested as mitigation measures:

- Tolling new lanes to encourage carpools and fund transit improvements
- Converting existing general-purpose lanes to HOV or HOT lanes
- Implementing or funding off-site travel demand management
- Implementing Intelligent Transportation Systems strategies to improve passenger throughput on existing lanes

Source: https://medium.com/@davidcanepa/toll-lanes-good-for-the-rich-bad-for-the-environment-4f1ec24105d3

Toll Lanes

No quantified reduction percentage is allocated to these strategies, and LSA could find no substantial evidence that would provide guidance to levels of significance after implementation of these strategies. Review of the four recommended strategies suggests that OPR is directing strategies away from general-purpose mixed-flow lanes on expressways, freeways, and arterial highways. Inasmuch as these are the project descriptions and Purpose and Need, the project intent and the project mitigation may be at odds. The City would be subject to an SOC for the capital project VMT impact.

7.3 FUNDING MECHANISMS

The change in the metric for transportation impacts from LOS to VMT will lead to a shift in impacts and mitigation measures from being local and project-specific to being more regional in nature. OPR acknowledges the regional nature of VMT impacts and states that regional VMT reduction programs and fee programs (in-lieu fees and development impact fees) may be appropriate forms of mitigation. Fee programs are particularly useful to address cumulative impacts. It is very important for the City to coordinate with the RTPA or Fresno COG to develop such mitigation programs that would fund transit, develop active transportation plans, etc. These programs are regional in nature and best suited for administration by the regional agency. Regional agencies may also wish to coordinate with appropriate stakeholders, including participating local jurisdictions, developers, and other interests while conducting nexus studies and checking for rough proportionality and compliance with CEQA.

Most of the VMT mitigations included in Appendix A are applicable in urban areas. They are less effective in suburban and rural contexts, where TDM strategies may become diluted or are not applicable. Thus, site-specific strategies are more suitable in urban areas, whereas program-level strategies are more suitable for projects in suburban/rural areas. In the latter approach, cumulative contributions for development mitigations can pay for VMT reduction strategies that would not be feasible for the individual projects to implement themselves. Apart from fee programs, program-based mitigation approaches may include mitigation exchanges and mitigation banks. The mitigation exchange concept requires a developer to implement a predetermined project that would reduce VMT in order to propose a new one. On the other hand, the concept of mitigation banks seeks to establish monetary values for VMT reductions so that developers can purchase VMT reduction credits.

DRAFT

As previously stated, VMT impacts are more regional in nature. Hence, there might be requirements for mitigations outside the control of the City, and without consent from the agency controlling the mitigations, the impacts might remain significant and unavoidable. Additionally, identification of regional improvements where projects can contribute their fair share to mitigate impacts might prove to be difficult. Therefore, LSA recommends that the City work collaboratively within its regions to ultimately establish fee programs, mitigation banks, and exchanges as the most efficient way to establish a regional mitigation pathway where the projects can contribute. Procedural flow charts for VMT banks, exchanges, and impact fees are illustrated at the end of this chapter.

APPENDIX A

VEHICLE MILES TRAVELED MITIGATION MEASURES FOR DEVELOPMENT PROJECTS (CAPCOA)

DRAFT

Table A - Vehicle Miles Traveled Mitigation Measures for Development Projects (CAPCOA)

#	Mitigation Measure	VMT Reduction[1]	Local VMT Reduction Calculations (Local Data/Fresno COG ABM)[2]	CAPCOA[3]	OPR TA[4]	Los Angeles Metro[5]	City of San Jose[6]	City of Los Angeles[7]	San Diego Region[8]	Notes
1	Provide a Bus Rapid Transit System (Addition of a New Route)	0.02% – 3.20%	0.33% VMT reduction per 100 miles	Y	Y	Y	N	N	Y	Notes: CAPCOA TST-1 (Applicable in urban and suburban context; negligible in rural context; appropriate for specific or general plans). This can be considered under Technical Advisory Measure 'Improve pedestrian or bicycle networks, or transit service.'
2	Provide a Bus Rapid Transit System (Substitution of an Existing Bus Route with a BRT Route)	0.02% – 3.20%	0.20% VMT reduction per 100 miles	Y	Y	Y	N	N	Y	Notes: CAPCOA TST-1 (Applicable in urban and suburban context; negligible in rural context; appropriate for specific or general plans). This can be considered under Technical Advisory Measure 'Improve pedestrian or bicycle networks, or transit service.'
3	Subsidize vanpool	0.30% - 13.40% commute VMT	0.60%	Y	Y	N	Y	N	Y	Notes: Similar to CAPCOA TRT-11 (Provide Employer-Sponsored Vanpool/Shuttle: applicable in urban, suburban, and rural context; appropriate for office, industrial, and mixed-use projects). The measure is included under the Technical Advisory Measure 'Provide incentives or subsidies that increase the use of modes other than single-occupancy vehicle.'; City of San Jose [Applicable for employment uses only]
4	Shifting single occupancy vehicle trips to carpooling or vanpooling, for example providing ride-matching or shuttle services	0.30% - 13.40% commute VMT reduction (for CAPCOA TRT-11: Provide Employer-Sponsored Vanpool/Shuttle); 7.20% - 15.80% school VMT reduction (for CAPCOA TRT-10: Implement a School Pool Program)	0.60% (for vanpool); x% (for carpool)	Y	Y	Y	Y	Y	Y	Notes: Similar to CAPCOA TRT-11 (Provide employer-sponsored vanpool/shuttle) - the measure is applicable for urban, suburban, and rural context, and is appropriate for office, industrial, and mixed-use projects; Similar measure is CAPCOA TRT-10 (Implement a School Pool Program: Applicable for urban, suburban, and rural context and appropriate for residential and mixed-use projects); City of San Jose [School carpool program - residential uses only)]; City of LA [School carpool program - level of implementation (low, medium, high); Employer sponsored vanpool or shuttle (Degree of implementation (low, medium, high), employees eligible (%), employer size (small, medium, large)]
5	Expand transit network	0.10% – 8.20%	0.07% VMT reduction per 100 miles (for addition of a new transit line)	Y	Y	Y	Y	Y	Y	Notes: CAPCOA TST-3; Measure applicable in urban and suburban context, maybe applicable in rural context but no literature documentation available, appropriate for specific or general plans. This can be considered under Technical Advisory Measure 'Improve pedestrian or bicycle networks, or transit service'; City of San Jose [Increase transit accessibility to improve last-mile transit connections; Improve network connectivity/design to make destinations and low-carbon travel modes accessible; both applicable for both residential and employment uses]; City of LA [Existing transit mode share (as a percent of total daily trips) (%), Lines within project site improved (<50%, >=50%)]
6	Incorporate bike lane street design (on-site)	1% increase in share of workers commuting by bicycle (for each additional mile of bike lanes per square mile) (*Bicycle Commuting and Facilities in Major U.S. Cities: If You Build Them, Commuters Will Use Them – Another Look* by Dill and Carr (2003)); 0.075% increase in bicycle commuting with each mile of bikeway per 100,000 residents (*If You Build Them, Commuters Will Use Them; Cross-Sectional Analysis of Commuters and Bicycle Facilities* by Nelson and Allen (1997))	0.30% VMT reduction per 100 miles (for addition of new bike lane)	Y	Y	Y	Y	Y	Y	Notes: CAPCOA SDT-5 [Grouped strategy, benefits of Bike Lane Street Design are small and should be grouped with the LUT-9 (Improve Design of Development) strategy to strengthen street network characteristics and enhance multi-modal environments], the measure is applicable in urban and suburban contexts and is appropriate for residential, retail, office, industrial, and mixed-use projects. This can be considered under Technical Advisory Measure 'Improve pedestrian or bicycle networks, or transit service'; City of San Jose [Expand the reach of bike access with investment in infrastructure: applicable for both residential and employment uses]; City of LA [Provide bicycle facility along site (Yes/No)]
7	Improve or increase access to transit	CAPCOA TST-2: Not quantified alone, grouped strategy with TST-3 'Expand transit network' and TST-4 'Increase transit service frequency/speed'; CAPCOA LUT-5: 0.50% - 24.60%	N/A	Y	Y	Y	Y	Y	Y	Notes: CAPCOA TST-2: Implement Transit Access Improvements (applicable in urban and suburban context, and appropriate for residential, retail, office, mixed use, and industrial projects); CAPCOA LUT-5: Increase Transit Accessibility [May be grouped with CAPCOA measures LUT-3 (mixed use development), SDT-2 (traffic calmed streets with good connectivity), and PPT-1 through PPT-7 (parking management strategies); measures are applicable in urban and suburban contexts; appropriate in rural context if development site is adjacent to a commuter rail station with convenient rail service to a major employment center; appropriate for residential, retail, office, industrial, and mixed-use projects]; City of San Jose [Increase transit accessibility to improve last-mile transit connections; Improve network connectivity/design to make destinations and low-carbon travel modes accessible; both applicable for both residential and employment uses]; City of LA [Existing transit mode share (as a percent of total daily trips) (%), Lines within project site improved (<50%, >=50%)]
8	Increase access to common goods and services, such as groceries, schools, and daycare	Similar to CAPCOA LUT-3 (Increase Diversity of Urban and Suburban Developments (Mixed Use)): 9.00% - 30.00% VMT reduction and CAPCOA LUT-4 (Increase Destination Accessibility): 6.70% - 20.00% VMT reduction	N/A	Y	Y	Y	Y	N	Y	Notes: Similar to CAPCOA LUT-3 (Increase Diversity of Urban and Suburban Developments (Mixed Use) - Applicable in urban and suburban context; negligible in rural context (unless the project is a master-planned community; appropriate for mixed-use projects) and CAPCOA LUT-4 (Applicable in urban and suburban context, negligible in rural context, appropriate for residential, retail, office, industrial, and mixed-use projects); City of San Jose [Access to Neighborhood Schools: Applicable for residential uses only]; City of San Jose [Very similar to measure 'Increase diversity of uses' - Applicable for residential and employment uses]
9	Incorporate affordable housing into the project	0.04% - 1.20%	N/A	Y	Y	Y	Y	N	Y	Notes: Similar measure is CAPCOA LUT-6 [Integrate Affordable and Below Market Rate Housing] - [Applicable in urban and suburban contexts; negligible impact in a rural context unless transit availability and proximity to jobs/services are existing characteristics; appropriate for residential and mixed-use projects]; City of San Jose [Similar to measure 'Integrate affordable and market rate housing] - Measure is applicable for residential uses only

LSA

Table A - Vehicle Miles Traveled Mitigation Measures for Development Projects (CAPCOA)

#	Mitigation Measure	VMT Reduction[1]	Local VMT Reduction Calculations (Local Data/Fresno COG ABM)[2]	CAPCOA[3]	OPR TA[4]	Los Angeles Metro[5]	City of San Jose[6]	City of Los Angeles[7]	San Diego Region[8]	Notes
10	Incorporate neighborhood electric vehicle network	0.50% - 12.70%	N/A	Y	Y	Y	N	N	Y	Notes: CAPCOA SDT-3 [Neighborhood electric vehicles (NEV) would result in a mode shift and therefore reduce the traditional vehicle VMT and GHG emissions. Range depends on the available NEV network and support facilities, NEV ownership levels, and the degree of shift from traditional; measure is applicable in urban, suburban, and rural context, for small citywide or large multi-use developments, and appropriate for mixed-use projects]
11	Orient project towards transit, bicycle, and pedestrian facilities	`1) 0.25% - 0.5% (0.25% reduction is attributed for a project oriented towards a planned corridor and 0.5% reduction is attributed for a project oriented towards an existing corridor) (as per the Sacramento Metropolitan Air Quality Management District (SMAQMD) *Recommended Guidance for Land Use Emission Reductions*), 2) 0.5% reduction in VMT per 1% increase in transit frequency and per 10% increase in transit ridership (as per the Center for Clean Air Policy (CCAP) *Transportation Emission Guidebook*)	N/A	Y	Y	Y	N	N	Y	Notes: CAPCOA LUT-7 [Orient project toward non-auto corridor]; Grouped strategy with LUT-3 (Increase Diversity of Urban and Suburban Developments (Mixed Use) ; there is no sufficient evidence that the measures results in non-negotiable trip reduction unless combined with other measures, including neighborhood design, density and diversity of development, transit accessibility and pedestrian and bicycle network improvements; the measure is applicable for urban or suburban context (may be applicable in a master-planned rural community) and is appropriate for residential, retail, office, industrial, and mixed use projects
12	Provide pedestrian network improvements	0.00% - 2.00%	N/A	Y	Y	Y	Y	Y	Y	Notes: CAPCOA SDT-1 [applicable in urban, suburban, and rural context; appropriate for residential, retail, office, industrial, and mixed-use projects; reduction benefit only occurs if the project has both pedestrian network improvements on site and connections to the larger off-site network]. This can be considered under Technical Advisory Measure 'Improve pedestrian or bicycle networks, or transit service'; City of San Jose [Provide pedestrian network improvements for active transportation: applicable for both residential and employment uses]; City of LA [Included (within project and connecting off-site/within project only)]
13	Increase transit service frequency/speed	0.02% – 2.50%	N/A	Y	Y	Y	Y	Y	Y	Notes: CAPCOA TST-4, applicable in urban and suburban context, maybe applicable in rural context but no literature documentation available, appropriate for specific or general plans. This can be considered under Technical Advisory Measure 'Improve pedestrian or bicycle networks, or transit service'; City of San Jose [Similar to measure 'Subsidize public transit service upgrades']; City of LA [Reduction in headways (increase in frequency) (%)]
14	Required project contributions to transportation infrastructure improvement projects	Not Quantified: Grouped strategy (with RPT-2 and TST-1 through 7)	N/A	Y	Y	Y	Y	Y	Y	Notes: CAPCOA RPT-3 (Applicable in urban, suburban and rural context; appropriate for residential, retail, office, mixed use, and industrial projects); measure similar to some of the measures discussed above. This can be considered under Technical Advisory Measure 'Improve pedestrian or bicycle networks, or transit service.'
15	Increase destination accessibility	6.70% – 20.00%	N/A	Y	Y	Y	Y	Y	Y	Notes: CAPCOA LUT-4 [Destination accessibility measured in terms of the number of jobs or other attractions reachable within a given travel time, which tends to be the highest at central locations and lowest at peripheral ones; the location of the project also increases the potential for pedestrians to walk and bike to these destinations and therefore reduces VMT; applicable for urban and suburban contexts, negligible impact in a rural context; appropriate for residential, retail, office, industrial, and mixed-use projects]. This can be considered under Technical Advisory Measure 'Improve pedestrian or bicycle networks, or transit service'; City of San Jose [Increase transit availability to improve last-mile transit connections; Improve network connectivity/design to make destinations and low-carbon travel modes accessible; both applicable for both residential and employment uses]; City of LA [Lines within project site improved (<50%, >=50%)]
16	Provide traffic calming measures	0.25% – 1.00%	N/A	Y	Y	Y	Y	Y	Y	Notes: CAPCOA SDT-2 [applicable in urban, suburban, and rural contexts; appropriate for residential, retail, office, industrial, and mixed-use projects]; City of San Jose [Applicable for both residential and employment uses]; City of LA [Streets with traffic calming improvements (%), intersections with traffic calming improvements (%)]
17	Provide bike parking in non-residential projects	0.625% (as per the Center for Clean Air Policy (CCAP) *Transportation Emission Guidebook*)	N/A	Y	Y	Y	Y	Y	Y	Notes: CAPCOA SDT-6 [Bike Parking in Non-Residential projects has minimal impacts as a standalone strategy and should be grouped with the LUT-9 (Improve Design of Development) strategy to encourage bicycling by providing strengthened street network characteristics and bicycle facilities]; the measure is applicable in urban, suburban, and rural contexts; appropriate for retail, office, industrial, and mixed-use projects; City of San Jose [Provide bike parking and end-of-trip facilities such as bike parking, bicycle lockers, showers, and personal lockers (Applicable for both residential and employment uses)]; City of LA [Include bike parking/lockers, showers, & repair station (Y/N)]
18	Provide bike parking with multi-unit residential projects	Not Quantified	N/A	Y	Y	Y	Y	Y	Y	Notes: CAPCOA SDT-7 [Grouped Strategy; the benefits of Bike Parking with Multi-Unit Residential Projects have no quantified impacts and should be grouped with the LUT-9 (Improve Design of Development) strategy to encourage bicycling by providing strengthened street network characteristics and bicycle facilities. The measure is applicable in urban, suburban, or rural contexts. It is appropriate for residential projects.]; City of San Jose [Provide bike parking and end-of-trip facilities such as bike parking, bicycle lockers, showers, and personal lockers (Applicable for both residential and employment uses)]; City of LA [Include bike parking/lockers, showers, & repair station (Y/N)]

Table A - Vehicle Miles Traveled Mitigation Measures for Development Projects (CAPCOA)

#	Mitigation Measure	VMT Reduction[1]	Local VMT Reduction Calculations (Local Data/Fresno COG ABM)[2]	CAPCOA[3]	OPR TA[4]	Los Angeles Metro[5]	City of San Jose[6]	City of Los Angeles[7]	San Diego Region[8]	Notes
19	Limit or eliminate parking supply	5.00% - 12.50%	N/A	Y	Y	Y	Y	Y	Y	Notes: CAPCOA PDT-1 (applicable in urban and suburban context, negligible in rural context, appropriate for residential, retail, office, industrial, and mixed-use projects); reduction can be counted only if spillover parking is controlled (via residential permits and on-street market parking); follow multi-faceted strategy including 1) elimination/reduction of minimum parking requirements, 2) creation of maximum parking requirements, and 3) provision of shared parking; City of San Jose [Decrease project parking supply at the project site to rates lower than the standard parking minimums where allowable in the San Jose Municipal Code (applicable for employment uses)]; City of LA [City code parking provision (spaces), actual parking provision (spaces)]
20	Unbundle parking costs from property costs	2.60% - 13.00%	N/A	Y	Y	Y	Y	Y	Y	Notes: CAPCOA PDT-2 (applicable in urban and suburban context, negligible in rural context, appropriate for residential, retail, office, industrial and mixed-use projects; complimentary strategies include workplace parking pricing); City of San Jose [Unbundle On-Site Parking Costs: Application for Residential Uses Only]; City of LA [Monthly cost for parking ($)]
21	Provide parking cash-out programs	0.60% – 7.70% commute VMT	N/A	Y	Y	Y	Y	Y	Y	Notes: CAPCOA TRT-15 [Implement employee parking "cash-out"; the term “cash out” is used to describe the employer providing employees with a choice of forgoing their current subsidized/free parking for a cash payment equivalent to the cost of the parking space to the employer. The measure is applicable in urban and suburban context; it is not applicable in rural context; it is appropriate for retail, office, industrial, and mixed-use projects. Restrictions are applied only if complementary strategies are in place: a) Residential parking permits and market rate public on-street parking to prevent spill over parking; b) Unbundled parking - is not required but provides a market signal to employers to forgo paying for parking spaces and “cash-out” the employee instead. In addition, unbundling parking provides a price with which employers can utilize as a means of establishing “cash-out” prices; City of San Jose [Parking cash-out: Employment uses only]; City of LA [Parking cash-out: Employees eligible (%)]
22	Implement or provide access to a commute reduction program - Voluntary	1.00% - 6.20% commute VMT	N/A	Y	Y	Y	Y	Y	Y	Notes: CAPCOA TRT-1: Commute Trip Reduction Program – Voluntary, is a multi-strategy program that encompasses a combination of individual measures described CAPCOA measures TRT-3 through TRT-9. It is presented as a means of preventing double-counting of reductions for individual measures that are included in this strategy. It does so by setting a maximum level of reductions that should be permitted for a combined set of strategies within a voluntary program. The main difference between a voluntary and a required program is: A) Monitoring and reporting is not required B) No established performance standards (i.e. no trip reduction requirements). The measure is applicable in urban and suburban contexts, negligible in a rural context, unless large employers exist and suite of strategies implemented are relevant in rural settings. The measure is appropriate for retail, office, industrial, and mixed-use projects; City of San Jose [Applicable for employment uses only]; City of LA [Employees and residents participating (%)]
23	Provide ride-sharing program	1.00% – 15.00% commute VMT	N/A	Y	Y	Y	Y	Y	Y	Notes: CAPCOA TRT-3 [Provide Ride-Sharing Programs: applicable in urban and suburban context; Negligible impact in many rural contexts, but can be effective when a large employer in a rural area draws from a workforce in an urban or suburban area, such as when a major employer moves from an urban location to a rural location; appropriate for residential, retail, office, industrial, and mixed-use projects]; City of San Jose [Ride share for employment uses only]; City of LA [Measured in terms of employees eligible (%)]
24	Implement car-sharing program	0.40% – 0.70%	N/A	Y	Y	Y	Y	Y	Y	Notes: CAPCOA TRT-9 [urban and suburban context, negligible in rural context, and appropriate for residential, retail, office, industrial, and mixed-use projects]; City of San Jose [Applicable for both residential and employment uses]; City of LA [Car share project setting (urban, suburban, all other)]
25	Implement bike-sharing program	Taking evidence from the literature, a 135-300% increase in bicycling (of which roughly 7% are shifting from vehicle travel) results in a negligible impact (around 0.03% VMT reduction)	N/A	Y	Y	N	Y	Y	Y	Notes: CAPCOA TRT-12 [This measure has minimal impacts when implemented alone. The strategy's effectiveness is heavily dependent on the location and context. Bike-sharing programs have worked well in densely populated areas (examples in Barcelona, London, Lyon, and Paris) with existing infrastructure for bicycling. Bike sharing programs should be combined with Bike Lane Street Design (SDT-5) and Improve Design of Development (LUT-9). The measure is applicable in urban and suburban-center context only; it is negligible in a rural context; appropriate for residential, retail, office, industrial, and mixed-use projects; City of San Jose [Bike share for employment and residential uses]; City of LA [bike share - within 600 feet of existing bike share station - OR -implementing new bike share station (Y/N)]
26	Provide transit passes	Similar to CAPCOA TRT-4 [Implement Subsidized or Discounted Transit Program]; for TRT-4, commute VMT reduction is 0.30% - 20.00%	N/A	Y	Y	Y	Y	Y	Y	Notes: Similar to CAPCOA TRT-4 [Implement Subsidized or Discounted Transit Program]; City of San Jose [Implement Subsidized or Discounted Transit Program]; City of LA [Employees and residents eligible (%), amount of transit subsidy per daily passenger (daily equivalent) ($)]

LSA

Table A - Vehicle Miles Traveled Mitigation Measures for Development Projects (CAPCOA)

#	Mitigation Measure	VMT Reduction[1]	Local VMT Reduction Calculations (Local Data/Fresno COG ABM)[2]	CAPCOA[3]	OPR TA[4]	Los Angeles Metro[5]	City of San Jose[6]	City of Los Angeles[7]	San Diego Region[8]	Notes
27	Implement a school pool program	7.20% - 15.80% school VMT reduction	N/A	Y	Y	N	Y	Y	Y	Notes: CAPCOA TRT-10 [This project will create a ridesharing program for school children. Most school districts provide bussing services to public schools only. School Pool helps match parents to transport students to private schools, or to schools where students cannot walk or bike but do not meet the requirements for bussing. The measure is applicable in urban, suburban, and rural context and is appropriate for residential and mixed-use projects.]; City of San Jose [School carpool program - residential uses only)]. This measure can be considered under the Technical Advisory Measure 'Shifting single occupancy vehicle trips to carpooling or vanpooling, for example providing ride matching services.'; City of LA [School carpool program - level of implementation (low, medium, high)
28	Operate free direct shuttle service	CAPCOA TST-6 (Provide Local Shuttles): Not Quantified; 0.30% - 13.40% commute VMT reduction (for CAPCOA TRT-11: Provide Employer-Sponsored Vanpool/Shuttle)	N/A	Y	Y	N	Y	Y	Y	Notes: CAPCOA TST-6 (Provide Local Shuttles - grouped strategy with TST-5 'Provide Bike Parking Near Transit' and TST-4 'Increase Transit Service Frequency/Speed') - Applicable in urban/suburban context; appropriate for large residential, retail, office, mixed use, and industrial projects; solves the "first mile/last mile" problem; CAPCOA TRT-11 (Provide employer-sponsored vanpool/shuttle) - the measure is applicable for urban, suburban, and rural context, and is appropriate for office, industrial, and mixed-use projects. This measure can be considered under the Technical Advisory Measure 'Shifting single occupancy vehicle trips to carpooling or vanpooling, for example providing ride matching services.'; City of San Jose [Employment uses only]; City of LA [Employer sponsored vanpool or shuttle (Degree of implementation (low, medium, high), employees eligible (%), employer size (small, medium, large)]
29	Provide teleworking options	0.07% - 5.50% commute VMT	N/A	Y	Y	Y	Y	Y	Y	Notes: CAPCOA TRT-6 [Applicable in urban, rural, and suburban contexts; appropriate for retail, office, industrial, and mixed-use projects]; City of San Jose [Alternative work schedules and telecommute (employment land uses only)]; City of LA [Alternative work schedules and telecommute (employees participating (%), type of program)]
30	Subsidize public transit service upgrades	Not Quantified	N/A	Y	Y	N	Y	N	Y	Notes: Similar to CAPCOA TST-2 through TST-4; City of San Jose [Subsidize transit service through contributions to the transit provider to improve transit service to the project (e.g. frequency and number of routes); applicable for both residential and employment uses]. The measure is included under the Technical Advisory Measure 'Provide incentives or subsidies that increase the use of modes other than single-occupancy vehicle.'
31	Implement subsidized or discounted transit program	0.30% – 20.00% commute VMT	N/A	Y	Y	Y	Y	Y	Y	Notes: CAPCOA TRT-4 [Implement subsidized or discounted transit program (the measure is applicable in urban and suburban context, negligible in a rural context, appropriate for residential, retail, office, industrial, and mixed-use projects); The project will provide subsidized/discounted daily or monthly public transit passes. The project may also provide free transfers between all shuttles and transit to participants. These passes can be partially or wholly subsidized by the employer, school, or development. Many entities use revenue from parking to offset the cost of such a project. The measure is included under the Technical Advisory Measure 'Provide incentives or subsidies that increase the use of modes other than single-occupancy vehicle.'; City of San Jose [Implement Subsidized or Discounted Transit Program]; City of LA [Transit subsidies measured by employees and residents eligible (%), and amount of transit subsidy per passenger (daily equivalent) ($)]
32	Providing on-site amenities at places of work, such as priority parking for carpools and vanpools, secure bike parking, and showers and locker rooms	22% increase in bicycle mode share (UK National Travel Survey)/2%-5% reduction in commute vehicle trips (*Transportation Demand Management Encyclopedia*)/0.625% reduction in VMT (*Center for Clean Air Policy (CCAP) Emission Guidebook*)	N/A	Y	Y	Y	Y	Y	Y	Notes: CAPCOA TRT-5 [Provide End of Trip Facilities]: End-of-trip facilities have minimal impacts when implemented alone. This strategy's effectiveness in reducing vehicle miles traveled (VMT) depends heavily on the suite of other transit, pedestrian/bicycle, and demand management measures offered. End-of trip facilities should be grouped with Commute Trip Reduction (CTR) Programs (TRT-1: Implement Commute Trip Reduction Program - Voluntary through TRT-2: Implement Commute Trip Reduction Program – Required Implementation/Monitoring) and TRT-3 (Provide Ride-Sharing Programs); City of San Jose [Similar measures include 'Provide bike parking/end of trip bike facilities', 'Implement car sharing programs']; City of LA [Include bike parking/lockers, showers, & repair station (Y/N)]
33	Provide employee transportation coordinators at employment sites	Not Quantified	N/A	Y	Y	Y	N	N	Y	Included as part of CAPCOA TRT-1 (Implement Commute Trip Reduction Program - Voluntary)
34	Provide a guaranteed ride home service to users of non-auto modes	Not Quantified	N/A	N	Y	Y	N	N	Y	
35	Locate project in an area of the region that already exhibits low VMT	10.00% - 65.00%	N/A	Y	Y	Y	N	N	Y	Notes: CAPCOA LUT-2 (Applicable in urban and suburban contexts; negligible in rural contexts; appropriate for residential, retail, office, industrial, and mixed-use projects)
36	Locate project near transit	0.50% - 24.60%	N/A	Y	Y	Y	N	N	Y	Notes: CAPCOA LUT-5 [May be grouped with CAPCOA measures LUT-3 (mixed use development), SDT-2 (traffic calmed streets with good connectivity), and PPT-1 through PPT-7 (parking management strategies); measures are applicable in urban and suburban contexts; appropriate in rural context if development site is adjacent to a commuter rail station with convenient rail service to a major employment center; appropriate for residential, retail, office, industrial, and mixed-use projects]
37	Increase project/development density	1.50% - 30.00%	N/A	Y	Y	Y	Y	N	Y	Notes: CAPCOA LUT-1 (Applicable in urban and suburban contexts only; negligible in rural context; appropriate for residential, retail, office, industrial, and mixed-use projects); City of San Jose [Applicable for both residential and employment uses]
38	Increase the mix of uses within the project or within the project's surroundings	9.00% - 30.00%	N/A	Y	Y	Y	Y	N	Y	Notes: CAPCOA LUT-3: Increase Diversity of Urban and Suburban Developments (Mixed Use) [Applicable in urban and suburban context, negligible in rural context, and appropriate for mixed-use projects]; City of San Jose [Applicable for both residential and employment uses]

Table A - Vehicle Miles Traveled Mitigation Measures for Development Projects (CAPCOA)

#	Mitigation Measure	VMT Reduction[1]	Local VMT Reduction Calculations (Local Data/Fresno COG ABM)[2]	CAPCOA[3]	OPR TA[4]	Los Angeles Metro[5]	City of San Jose[6]	City of Los Angeles[7]	San Diego Region[8]	Notes
39	Improve network connectivity and/or increase intersection density on the project site	Similar measure is CAPCOA LUT-9 [Improve Design of Development]: 3.0% - 21.3% reduction in VMT	N/A	Y	Y	Y	Y	N	Y	Notes: Similar measure to CAPCOA LUT-9 (Improve Design of Development); City of San Jose [Build new street connections and/or connect cul-de-sacs to provide pedestrian and bicycle access: applicable for both residential and employment uses]
40	Price workplace parking	0.10% - 19.70% commute VMT	N/A	Y	N	N	Y	Y	N	Notes: CAPCOA TRT-14 [Urban and suburban context; Negligible impact in a rural context; Appropriate for retail, office, industrial, and mixed-use projects; Reductions applied only if complementary strategies are in place: o Residential parking permits and market rate public on-street parking - to prevent spill-over parking o Unbundled parking - is not required but provides a market signal to employers to transfer over the, now explicit, cost of parking to the employees. In addition, unbundling parking provides a price with which employers can utilize as a means of establishing workplace parking prices; City of San Jose [Price On-Site Workplace Parking (for employment uses only)]; City of LA [Daily parking charge ($), Employees subject to priced parking (%)]
41	Locate project near bike path/bike lane	0.625%	N/A	Y	N	Y	N	N	N	Notes: CAPCOA LUT-8 (Grouped strategy with 'Increase Destination Accessibility'; the measure is most effective when applied in combination of multiple design elements that encourage this use; strategy should be grouped with 'Increase Destination Accessibility' strategy to increase the opportunities for multi-modal travel; measure is applicable in urban or suburban context, may be applicable in a rural master planned community; appropriate for residential, retail, office, industrial, and mixed-use projects
42	Implement Commute Trip Reduction Marketing	0.80% - 4.00% commute VMT	N/A	Y	N	Y	Y	N	N	Notes: CAPCOA TRT-7 (applicable in urban and suburban context; negligible in rural context; appropriate for residential, retail, office, industrial, and mixed-use projects); City of San Jose [Employment uses only]
43	Education and encouragement - Voluntary travel behavior change program	1.00% - 6.20% commute VMT	N/A	Y	N	N	Y	Y	N	Notes: Similar to CAPCOA TRT-1 (Implement Commute Reduction Program - Voluntary); City of San Jose [For both residential and employment uses]; City of LA [Employees and residents participating (%)]
44	Education and encouragement - Promotions and marketing	0.80% - 4.00% commute VMT	N/A	Y	N	N	Y	Y	N	Notes: Similar to CAPCOA TRT-7 [Implement Commute Reduction Marketing]; City of San Jose [Similar measure might be 'Implement commute trip reduction marketing/educational campaign' (applicable for employment uses)]; City of LA [Employees and residents participating (%)]
45	Implement neighborhood shuttle	Not Quantified	N/A	Y	N	N	Y	Y	N	Notes: CAPCOA TST-6 (Provide Local Shuttles - grouped strategy with TST-5 'Provide Bike Parking Near Transit' and TST-4 'Increase Transit Service Frequency/Speed') - Applicable in urban/suburban context; appropriate for large residential, retail, office, mixed use, and industrial projects; solves the "first mile/last mile" problem; City of San Jose [Similar measure: 'Operate a free direct shuttle service' (applicable for employment uses only)]; City of LA [Degree of Implementation (low/medium/high), employees and residents eligible (%)]
46	Install park-and-ride lots	Two sources: 0.10% - 0.50% VMT reduction (as per 2005 Federal Highway Administration (FHWA) study) and 0.50% VMT reduction per day (as per Washington State Department of Transportation (WSDOT))	N/A	Y	N	N	N	N	N	Notes: CAPCOA RPT-4 (Applicable in suburban and rural context; appropriate for residential, retail, office, mixed use, and industrial projects); Grouped strategy with RPT-1, TRT-11, TRT-3, and TRT-1 through 6
47	Electrify loading docks and/or require idling-reduction systems	26% - 71% reduction in Truck refrigeration units (TRU) idling GHG emissions	N/A	Y	N	N	N	N	N	Notes: CAPCOA VT-1 (Measure applicability: Truck refrigeration units (TRU))
48	Utilize alternative fueled vehicles	Reduction in GHG emissions varies depending on vehicle type, year, and associated fuel economy	N/A	Y	N	N	N	N	N	Notes: CAPCOA VT-2 (Measure applicability: vehicles)
49	Utilize electric or hybrid vehicles	0.40% - 20.30% reduction in GHG emissions	N/A	Y	N	N	N	N	N	Notes: CAPCOA VT-3 (Measure applicability: vehicles)
50	Provide bike parking near transit	Not Quantified	N/A	Y	N	N	N	N	N	Notes: CAPCOA TST-5 (should be implemented with other two measures as mentioned to encourage multi-modal use in the area and provide ease of access to nearby transit for bicyclists (measure applicable in urban and suburban context; appropriate for residential, retail, office, mixed use, and industrial projects); Grouped strategy (with measures TST-3 'Expand transit network' and TST-4 'Increase transit service frequency/speed')
51	Improve design of development	3.00% - 21.30%	N/A	Y	N	N	N	N	N	Notes: CAPCOA LUT-9 (Include design elements to enhance walkability and connectivity; improved street network characteristics within a neighborhood such as street accessibility; design also measured in terms of sidewalk coverage, building setbacks, street widths, pedestrians crossings, presence of street trees, and a host of other physical variables that differentiate pedestrian-oriented environments from auto-oriented environments); measure is applicable in the urban and suburban contexts, negligible impact in rural context; appropriate for residential, retail, office, industrial, and mixed-use projects
52	Provide electric vehicle parking	Not Quantified	N/A	Y	N	N	N	N	N	Notes: CAPCOA SDT-8 [This is a grouped strategy and the benefits of electric vehicle parking may be quantified when grouped with the use of electric vehicles and or SDT-3 (Implement a Neighborhood Electric Vehicle (NEV) Network). This measure is applicable in urban or suburban contexts and is appropriate for residential, retail, office, mixed use, and industrial projects.]

LSA

Table A - Vehicle Miles Traveled Mitigation Measures for Development Projects (CAPCOA)

#	Mitigation Measure	VMT Reduction[1]	Local VMT Reduction Calculations (Local Data/Fresno COG ABM)[2]	CAPCOA[3]	OPR TA[4]	Los Angeles Metro[5]	City of San Jose[6]	City of Los Angeles[7]	San Diego Region[8]	Notes
53	Dedicated land for bike trails	Not Quantified	N/A	Y	N	N	N	N	N	Notes: CAPCOA SDT-9 [Larger projects may be required to provide for, contribute to, or dedicate land for the provision of off-site bicycle trails linking the project to designated bicycle commuting routes in accordance with an adopted citywide or countywide bikeway plan. The benefits of Land Dedication for Bike Trails have not been quantified and should be grouped with the LUT-9 (Improve Design of Development) strategy to strengthen street network characteristics and improve connectivity to off-site bicycle networks. The measure is applicable in urban, suburban, or rural contexts and is appropriate for large residential, retail, office, mixed use, and industrial projects.]
54	Implement school bus program	38.00% - 63.00% school VMT reduction	N/A	Y	N	N	N	N	N	Notes: CAPCOA TRT-13 [Applicable in urban, suburban, and rural context; appropriate for residential and mixed-use projects]
55	Implement preferential parking permit program	Not Quantified	N/A	Y	N	N	N	N	N	Notes: CAPCOA TRT-8 [The project will provide preferential parking in convenient locations (such as near public transportation or building front doors) in terms of free or reduced parking fees, priority parking, or reserved parking for commuters who carpool, vanpool, ride-share or use alternatively fueled vehicles. The project will provide wide parking spaces to accommodate vanpool vehicles. The impact of preferential parking permit programs has not been quantified by the literature and is likely to have negligible impacts when implemented alone. This strategy should be grouped with Commute Trip Reduction (CTR) Programs (TRT-1 and TRT-2) and TRT-3 (Provide Ride-Sharing Programs) as a complementary strategy for encouraging non-single occupant vehicle travel. This measure is applicable in urban and suburban contexts and is appropriate for residential, retail, office, mixed use, and industrial projects.]

APPENDIX B

VEHICLE MILES TRAVELED MITIGATION MEASURES FOR DEVELOPMENT PROJECTS (CARB PAPERS)

DRAFT

LSA

Table B - Vehicle Miles Traveled Mitigation Measures for Development Projects (CARB Papers)[1]

#	Mitigation Measure	VMT Reduction[2]	Local VMT Reduction Calculations (Local Data/Fresno COG ABM)[3]	Notes
1	Provide Bicycling Network Improvements	No effect on VMT	0.30% VMT reduction per 100 miles (for addition of new bike lane)	
2	Implement Transit Improvements	No effect on VMT	0.07% VMT reduction per 100 miles (for addition of a new transit line)	
3	Improve or increase access to transit	1.3% - 5.8%	N/A	Variable: Various factors associated with proximity to transit stop (please refer to *How do Local Actions Affect CMT? A Critical Review of the Empirical Evidence* (Salon, D., Boarnet, M.G., Handy, S., Spears, S., and Tal, G.)
4	Land Use Mix	Elasticity: 0.02 - 0.10	N/A	Variable: Entropy - variety and balance of land-use types within a neighborhood
5	Regional Accessibility	Elasticity: 0.05 - 0.25	N/A	Variable: Various factors associated with job accessibility and distance to CBD (please refer to *How do Local Actions Affect CMT? A Critical Review of the Empirical Evidence* (Salon, D., Boarnet, M.G., Handy, S., Spears, S., and Tal, G.)
6	Job-Housing Balance	Elasticity: 0.06 - 0.31 for commute VMT	N/A	Variable: Various factors associated with job accessibility (please refer to *How do Local Actions Affect CMT? A Critical Review of the Empirical Evidence* (Salon, D., Boarnet, M.G., Handy, S., Spears, S., and Tal, G.)
7	Provide Pedestrian Network Improvements	Elasticity: 0.00 - 0.02 for sidewalk length, 0.19 for Pedestrian Environment Factor	N/A	
8	Voluntary Travel Behavior Change (VTBC) Program	5% - 12%	N/A	
9	Implement Employer-Based Trip Reduction (EBTR) Program	1.33% - 6% of commute VMT	N/A	
10	Provide telecommuting options	Home-based telecommuting: 48.1% for household VMT, 66.5% - 76.6% for all personal VMT, and 90.3% for commute VMT only; Center-based telecommuting: 53.7% - 64.8% for all personal VMT and 62.0% - 77.2% for commute VMT only	N/A	
11	Increase Project/Development Density	Elasticity: <=0.07 - 0.19	N/A	Variable: residential density
12	Improve network connectivity and/or increase intersection density on the project site	Elasticity: -0.46 - 0.59	N/A	Variable: Various factors associated with intersection or street density (please refer to *How do Local Actions Affect CMT? A Critical Review of the Empirical Evidence* (Salon, D., Boarnet, M.G., Handy, S., Spears, S., and Tal, G.)
13	Implement Parking Cash-out Programs or Workplace Parking Pricing	12% of commute VMT (parking cash out); 2.3% - 2.9% for $3 per day workplace parking price; 2.8% for price increase equivalent to 60% hourly value of commuter travel time cost	N/A	

Notes:

VMT = Vehicle Miles Traveled

[1] All mitigation measures have been obtained from *How do Local Actions Affect CMT? A Critical Review of the Empirical Evidence* (Salon, D., Boarnet, M.G., Handy, S., Spears, S., and Tal, G.).

[2] All VMT reduction numbers have been obtained from *How do Local Actions Affect CMT? A Critical Review of the Empirical Evidence* (Salon, D., Boarnet, M.G., Handy, S., Spears, S., and Tal, G.).

[3] Fresno COG VMT reduction recommendation for this measure obtained based on analysis conducted by Fresno COG staff and LSA using local data and/or the COG's Activity Based Model.

DRAFT

APPENDIX C

VEHICLE MILES TRAVELED MITIGATION MEASURES FOR COMMUNITY PLANS AND GENERAL PLANS

DRAFT

LSA

Table C - Vehicle Miles Traveled Mitigation Measures for Community Plans and General Plans[1]

#	Mitigation Measure	CAPCOA VMT Reduction	Local VMT Reduction Calculations (Local Data/Fresno COG ABM)[2]
1	Shift single occupancy vehicle trips to carpooling or vanpooling by providing ride-matching services or shuttle services	0.30% - 13.40% commute VMT reduction (for CAPCOA TRT-11: (Provide Employer-Sponsored Vanpool/Shuttle)); Grouped strategy (for CAPCOA TST-6 (Provide Local Shuttles))	0.60% (for vanpool); x% (for carpool)
2	Provide enhanced bicycle and/or pedestrian facilities	0.00% - 2.00% (for pedestrian network improvements); Multiple measures for bike facilities, refer to Table A for VMT reduction percentages	0.30% VMT reduction per 100 miles (for addition of new bike lane)
3	Provide incentives or subsidies that increase the use of modes other than a single-occupancy vehicle	0.30% - 13.40% commute VMT reduction (for CAPCOA TRT-11: (Provide Employer-Sponsored Vanpool/Shuttle)); Grouped strategy (for CAPCOA TST-6 (Provide Local Shuttles)); 0.30% - 20.00% commute VMT reduction (for CAPCOA TRT-4 (Implement Subsidized or Discounted Transit Program))	0.60% (for vanpool); x% (for carpool)
4	Modify land use plan to increase development in areas with low VMT/capita characteristics and/or decrease development in areas with high VMT/capita characteristics	Not quantified in CAPCOA	N/A
5	Add roadways to the street network if those roadways would provide shorter travel paths for existing and/or future trips	Not quantified in CAPCOA	N/A
6	Improve or increase access to transit	CAPCOA TST-2 (Implement transit access improvements): Not quantified alone, grouped strategy with TST-3 (Expand transit network) and TST-4 (Increase transit service frequency/speed); CAPCOA LUT-5 (Increase transit accessibility): 0.50% - 24.60%	N/A
7	Increase access to common goods and services, such as groceries, schools, and daycare	Similar to CAPCOA LUT-3 (Increase Diversity of Urban and Suburban Developments (Mixed Use)): 9.00% - 30.00% VMT reduction and CAPCOA LUT-4 (Increase Destination Accessibility): 6.70% - 20.00% VMT reduction	N/A
8	Incorporate a neighborhood electric vehicle network	0.50% - 12.70%	N/A
9	Provide traffic calming	0.25% – 1.00%	N/A
10	Limit or eliminate parking supply	5.00% - 12.50%	N/A

LSA

Table C - Vehicle Miles Traveled Mitigation Measures for Community Plans and General Plans[1]

#	Mitigation Measure	CAPCOA VMT Reduction	Local VMT Reduction Calculations (Local Data/Fresno COG ABM)[2]
11	Implement or provide access to a commute reduction program - Voluntary	1.00% - 6.20% commute VMT	N/A
12	Provide car-sharing, bike sharing, and ride-sharing programs	0.40% - 0.70% VMT reduction (for car sharing); 1.00% - 15.00% commute VMT reduction (for ride-sharing); a 135% - 300% increase in biking (of which roughly 7% are shifting from vehicle travel) results in a negligible impact (around 0.03% VMT reduction)	N/A
13	Provide partially or fully subsidized transit passes	Similar to CAPCOA TRT-4 [Implement Subsidized or Discounted Transit Program]; for TRT-4, commute VMT reduction is 0.30% - 20.00%	N/A
14	Provide telework options	0.07% - 5.50% commute VMT	N/A
15	Provide employee transportation coordinators at employment sites	Not quantified in CAPCOA	N/A
16	Provide a guaranteed ride home service to users of non-auto modes	Not quantified in CAPCOA	N/A

Dedication

This Handbook is intended to provide tools and methods to people who are doing the hard work on the ground. The hard work of reducing our impact on climate change, making communities more resilient to the effects of climate change, and promoting health and equity among communities that bear disproportionate environmental burdens. The hard work to include everyone in what Dr. Martin Luther King Jr. referred to as "an inescapable network of mutuality" in his 1967 *Christmas Sermon on Peace*.

What we do today will either remedy or perpetuate past environmental injustices. What we do today will shape our climate tomorrow. Our communities are being changed by climate and will change more.

When we understand the tons of carbon emitted, the feet of sea level rise, and the degrees of temperature change, we will know better the consequences of our actions. When we listen, respect, engage, involve, and empower all people affected by our actions, we will know better the diverse concerns, needs, and hopes of all our communities.

With this understanding, we can and must take action to reduce our contributions to climate change, to make our communities more resilient, and to implement solutions that are informed by and responsive to the people most affected by new plans, projects, and programs. We need to do this with and for the people left out too often in the past to mold a better future for this generation and the generations to come. We need to do this for a state, a country, and a planet that is changing rapidly due our actions and inactions.

This Handbook is dedicated to all Californians—whose health, wellbeing, and safety are at the heart of all our efforts. We build and design communities for people, yet often the human perspective is lost amidst discussions around emissions, thresholds of significance, vehicle miles traveled, and site plans. We aim to re-center people in this conversation—especially the people whose voices have been marginalized and excluded from participating in the planning that shapes all our lives. At its core, the Handbook is designed and developed by people, for people, and for the sake of creating livable, prosperous, resilient communities in which all can thrive, now and into the future.

An Important Consideration

CAPCOA prepared this Handbook to provide a common platform of information and tools for evaluating greenhouse gas reduction measures, climate vulnerabilities and promoting equity to support sustainable, resilient, and equitable land use planning and project design. It was prepared in collaboration with academia, agencies, community organizations and leaders, local governments, nongovernmental organizations, and technical experts. The quantification methods, tools, and recommendations provided in this Handbook were developed based on the latest science and literature available at the time of publication.

Our understanding of climate science and accepted practice for how equity and environmental justice can and should be addressed in land use planning continues to evolve. Regulations, policies, and government programs to reduce greenhouse gas emissions are likewise dynamic. Future legislation, litigation, public opinion, and scientific research may influence how climate change, emissions reduction, and health and equity are reviewed and addressed in our community.

In light of these considerations, this Handbook should be viewed as a *planning resource*. It provides strategies, tools, and analytical methods to facilitate integrated and resilient decision making, despite potential future planning uncertainty. The Handbook should not be used to dictate public policy or provide legal advice.

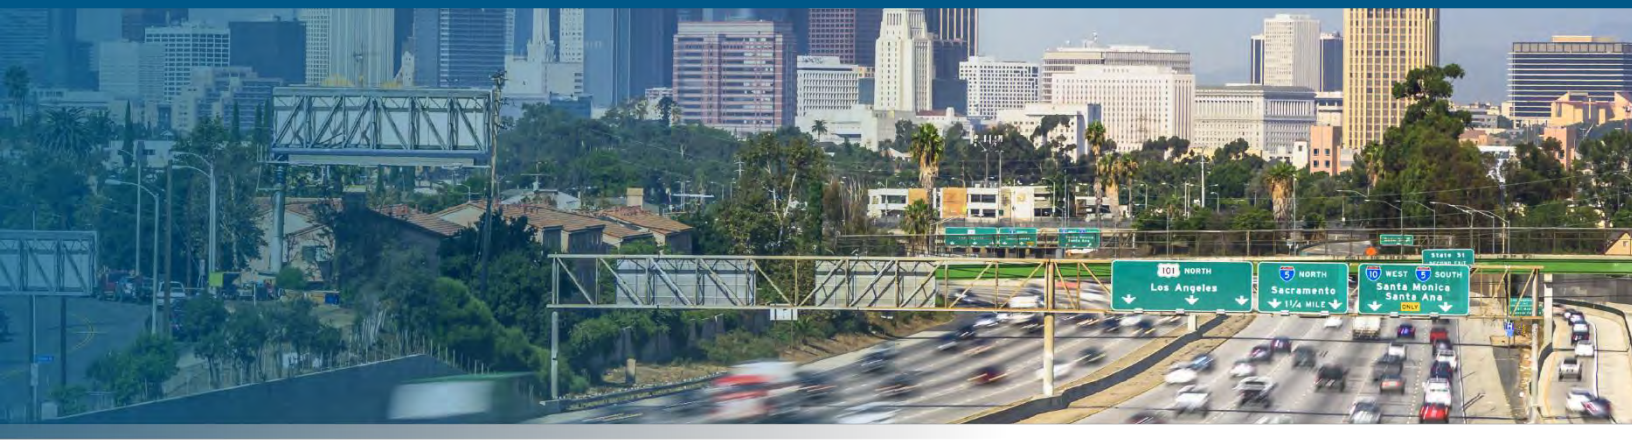
Introduction

CHAPTER 1



Background

Climate change is already having profound impacts on people and planning in California. Local governments, institutions, project developers, and communities across the state must prepare for growing climate impacts while working to reduce their greenhouse gas (GHG) emissions. These are real challenges, but they also represent new opportunities. We can design and build healthier neighborhoods, develop solutions for clean air, and create more equitable, resilient communities and economies. This Handbook offers data and methods to help effectively achieve these objectives.

Local governments and communities are increasingly experiencing the effects of climate change and, in response, are developing measures and plans to mitigate and adapt to those effects. Climate change is principally driven by human actions, particularly burning fossil fuels like coal, oil, and natural gas that emit GHGs. GHGs trap heat in the atmosphere, which slowly increases global average temperatures, causing additional cascading effects such as extreme heat and heat waves, melting polar ice, disappearing snowpack, rising sea levels, changing precipitation patterns, ocean acidification, and more extreme or more frequent weather events.

To slow the pace of climate change and prevent its worst effects from materializing, local, state, and national governments must design measures that mitigate (i.e., lessen the severity or even eliminate) the root cause of the issue: GHG emissions from human

activities. To do so, they need tools and resources to accurately assess and quantify GHG emissions, and to design effective methods to reduce emissions.

In response to this need, the California Air Pollution Control Officers Association (CAPCOA) prepared this report, *Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity: Designed for Local Governments, Communities, and Project Developers* (hereafter referred to as the "Handbook"). The Handbook provides methods to quantify GHG emission reductions from a specified list of measures, primarily focused on project-level actions. The Handbook also includes a method to assess potential benefits of different climate vulnerability reduction measures, as well as measures that can be implemented to improve health and equity, again at the project level.

CAPCOA included a wide range of measures in the Handbook that are frequently used to reduce GHG emissions, bolster communities against expected climate impacts, and enhance community health and equity. To focus on the most effective measures, they were screened using the following factors:

- Feasibility of quantifying emissions reductions or benefits.
- Availability of robust and meaningful data, including peer reviewed studies.
- Ability of measures (alone or in combination with other measures) to appreciably reduce GHG emissions, reduce climate vulnerabilities, and improve health and equity.

This does not mean that other measures should not be considered or may not be effective or quantifiable; on the contrary, there are many ways to reduce emissions of GHGs, reduce climate vulnerabilities, and improve health and equity. CAPCOA seeks to provide a high-quality quantification tool to local governments, communities, and stakeholders with the broadest applicability possible. CAPCOA encourages users to be bold and creative as they approach the challenges of climate change and equity and does not intend for the Handbook to limit the scope of measures considered.

In addition to CAPCOA, other organizations that helped to prepare this Handbook include the Sacramento Metropolitan Air Quality Management District, with contract support from ICF, Fehr & Peers, and STI, who performed the technical analysis.

Process and Approach for Handbook Development

The Handbook builds on CAPCOA's previous efforts to provide accurate and reliable quantification measures. In 2010, CAPCOA published *Quantifying Greenhouse Gas Mitigation Measures: A Resource for Local Government to Assess Emissions Reductions from Greenhouse Gas Mitigation Measures* (hereafter referred to as the "2010 Handbook"). Since that time, climate science has evolved and GHG reduction practices have advanced in sophistication. New priorities have also arisen, such as strengthening climate resilience and infusing health and equity into integrated planning efforts. Therefore, CAPCOA decided it was time to develop an updated and expanded resource to provide the latest data and

methods to quantify GHG emissions reductions, climate change vulnerability reductions, and equity improvements in a single resource: The Handbook.

The Handbook development process involved five key tasks.

1. Identifying and evaluating new and emerging GHG reduction measures and removing outdated measures from the 2010 Handbook.
2. Evaluating and selecting climate risk reduction and health and equity measures.
3. Developing methods to quantify GHG emissions reduction measures and identify associated co-benefits.
4. Developing methods to assess climate change vulnerability and a framework to quantify reductions in climate vulnerabilities.
5. Developing health and equity measures.

WHAT'S NEW IN THIS HANDBOOK?

This Handbook is an updated and expanded resource from the 2010 Handbook. It provides the following.

- Updated data and new measures to quantify GHG emission reductions.
- Method to identify and score future potential climate hazards.
- Measures to quantify reduced vulnerability to climate change.
- Measures to improve health and equity.

The development process was a collaborative and methodical effort that involved careful review and input from experts in agencies, academia, public organizations, non-governmental organizations (NGOs), and other stakeholder groups. A technical advisory committee (TAC) was formed to provide ongoing guidance, peer review, and quality control assurance at each step of the process. The Handbook was drafted and finalized through an iterative process that incorporated comments and suggestions from the Sacramento Metropolitan Air Quality Management District, the TAC, and the public.

The Handbook was primarily funded by a California Department of Transportation (Caltrans) Senate Bill (SB) 1 Adaptation Planning Grant. Additional funding was provided by the Sacramento Metropolitan Air Quality Management District, the California Department of Public Health, and the Bay Area Air Quality Management District.

Intent and Audience

The purpose of the Handbook is to provide local governments with accurate, reliable, and standardized emission reduction quantification methods for land use, climate action, and long-term planning. It also aims to support and enhance the consideration of climate vulnerabilities, health, and equity during the planning process. The Handbook is intended to support the efforts of local governments to address GHG emissions and vulnerabilities to climate change in their planning efforts and environmental review of new projects, and to achieve more equitable outcomes when addressing these impacts. The Handbook will

B3 Attach #1 of 3

also be useful for project proponents and other parties interested in enhancing resiliency, sustainability, and equitable development.

The guidance provided in the Handbook specifically addresses appropriate procedures to apply quantification methods to achieve accurate and reliable results. The Handbook includes background information on programs and concepts associated with the quantification of GHG emissions and climate change vulnerability. The Handbook does not provide policy guidance on any of these issues, nor does it dictate how a jurisdiction should address questions of policy. Policy considerations are left to individual agencies and their governing boards. The Handbook is intended to create a standardized approach to quantifying GHG reduction and climate change resilience measures so the effectiveness of these measures can be considered and compared on a common basis.

Using the Handbook

The Handbook is organized as follows.

- *Chapter 1: Introduction* – provides an overview of the Handbook and its contents.
- *Chapter 2: Integrated and Resilient Planning* – discusses the changing climate, its impacts on society and public health, federal and state planning efforts to address the problem, and how equity and resilience can be improved.
- *Chapter 3: Measures to Reduce GHG Emissions* – provides details on measures and methods to quantify and reduce GHG emissions, accompanied by measure factsheets.
- *Chapter 4: Assessing Climate Exposures and Measures to Reduce Vulnerabilities* – outlines a method to assess climate change vulnerability and the potential benefits of different climate risk reduction measures at the project level.
- *Chapter 5: Measures for Advancing Health and Equity* – describes measures to improve public health and social equity.
- *Chapter 6: Resources to Support Resilient and Equitable Emission Reduction Planning* – presents additional resources that can help resilient and equitable planning efforts.
- *Appendix A: Key Terms and Definitions* – defines the key terms used in the Handbook.
- *Appendix B: Federal and State Planning Framework* – describes federal and state regulations and policies related to reducing GHG emissions, increasing climate resilience, and improving public health and social equity.
- *Appendix C: Emission Factors and Data Tables* – provides the emission factors and data used to estimate GHG emission reductions.

B3 Attach #1 of 3

- *Appendix D: Climate Vulnerability Worksheets* – contains worksheets planners can use to assess climate vulnerability.
- *Appendix E: Measure Index* – crosswalks the Handbook measures to cross-cutting themes across all chapters (e.g., active transportation).

Because the quantification and analysis methods in the Handbook were developed to meet the highest standards for accuracy and reliability, CAPCOA believes they will be generally accepted for most purposes, though the decision to accept any quantification method rests with the reviewing agency and Handbook user. The methods contained in the Handbook include generalized information about the measures, including considerations and best practices for successful implementation and assumptions that influence the expected measure outcome. These assumptions include emissions factors, energy usage rates, climate exposures for a specific location, and other data from various sources (most commonly from published data from public agencies). The data were carefully reviewed to ensure they represent the best information available. The use of generalized information allows the quantification methods to be applied across a range of circumstances, including variations in location, climate, and population density, among others.

For instances in which high quality, project-specific data are available, those data should be used instead of the more generalized data presented in the Handbook. The quantification and analysis methods provided in this Handbook allow for such substitutions. Handbook users should confirm any substituted data meets quality standards and will not result in an inappropriate or under- or overestimation of measure benefits. CAPCOA will not be able to provide case-by-case review of adjustments or project-specific data inputs. More information on the measures and analysis data are provided in Chapter 3, *Measures to Reduce GHG Emissions*, Chapter 4, *Assessing Climate Exposures and Measures to Reduce Vulnerabilities*, and Chapter 5, *Measures for Advancing Health and Equity*.

APPROPRIATE USES OF THE HANDBOOK

- Explore emissions reduction measures and identify methods to quantify GHG reductions for a program or plan.
- Learn about co-benefits of reducing GHG emissions.
- Conduct a preliminary assessment of climate vulnerability for a project or a plan.
- Explore ways to make a project or plan more climate resilient.
- Identify ways to include and empower underserved and marginalized communities and address their concerns.

Equally important to understanding how to effectively use the Handbook is knowing its limitations and potential *misuses*. This will help safeguard against inappropriate application of the Handbook in certain contexts. The Handbook should not be used to dictate public policy or provide legal advice. While the list of measures presented in the Handbook is comprehensive, it should not be used to exclude or reject other strategies from

B3 Attach #1 of 3

consideration. As discussed above, there are many ways to reduce emissions, reduce climate vulnerabilities, and improve health and equity, some of which may not be captured in this Handbook or may be developed after its publication. Conversely, the Handbook measures and quantitative methods (including available defaults) should not be automatically applied to a project without thoughtful consideration of project-specific circumstances. Finally, the Handbook should not be used to complete an environmental justice analysis pursuant to Executive Order 12898 or the National Environmental Policy Act (NEPA). The Handbook may be used as a starting point for these types of analyses, but it does not constitute guidance for compliance with the executive order or NEPA requirements.

Integrated and Resilient Planning

CHAPTER 2

The Changing Climate

The Earth's climate is dynamic and has shifted over time. However, changes in the global climate have accelerated over the past 50 years due to human activities. Underserved and low-income communities are disproportionately impacted by the effects of climate change, as well as other environmental burdens, including air pollution. Various federal and state regulations have been adopted to reduce greenhouse gas (GHG) emissions, improve environmental justice and social equity, and help communities plan for and adapt to anticipated changes in our climate. Beyond regulation, developers and decisionmakers can build future equity and resilience through informed and holistic project planning.

California is already seeing the effects of climate change on its natural resources, populations, and infrastructure. Major environmental indicators have shifted; since the start of the twentieth century, peak runoff in the Sacramento River now occurs nearly a month earlier, and glaciers in the Sierra Nevada have lost about 70 percent of their area. The state has experienced major climate events in recent years, including a drought from 2012–2016 that heavily affected the agricultural sector and resulted in statewide water conservation efforts, followed by an extremely wet winter in 2016–2017 that caused significant loss of life and damage to infrastructure. The frequency, size, and devastation of wildfires have also

increased: 12 of the 20 largest wildfires (in terms of acres burned) in the state's recorded history occurred between December 2017 and the writing of this Handbook, including five in 2020 and four in 2021 alone (Cal Fire 2021).

As human activities and natural processes continue to increase GHG emissions across the globe, the impacts of climate change are likely to continue and worsen in the future. Specifically, the following climate hazards are projected to occur in California over the next century (Bedsworth, et al. 2018).

- Increase in annual average maximum daily temperature of up to 5.8°F by 2050 and up to 8.8°F by 2100.
- Increase in intensity of atmospheric river events, with northern California experiencing more wet extremes and southern California becoming drier.
- Increase in frequency and intensity of drought.
- Increase in the amount of precipitation falling as rain (instead of snow) and a corresponding decrease in accumulated snowpack.
- Increase in high wildfire risk conditions and projected increase in number of acres burned by wildfire.
- Increase in sea level rise along the coast, ranging from about 0.7 to 2.3 feet, by 2050.

These and other climate hazards will negatively impact public health and infrastructure. Increased temperatures, increased humidity, and a higher frequency of extreme heat events will lead to worsening air quality and increased risk of dehydration, respiratory problems (e.g., asthma), and cardiovascular problems (e.g., heart attacks) among individuals. Cumulative deterioration of public health from heat-related ailments and other climate stressors are projected to increase emergency room visits and hospitalizations (Ziegler, Morelli, and Fawibe 2017). Extreme events like heat waves, flooding, and wildfires can cause loss of life and directly damage buildings and infrastructure. Extreme weather events can shutdown critical services and inhibit individuals from reaching healthcare and other critical supports. Power infrastructure and supply chains can also be disrupted (No Harm Canada n.d.). Climate hazards can also have significant indirect impacts, such as increased water prices during drought conditions and reduced recreational opportunities along coastal communities from sea level rise.

Certain populations will be more vulnerable to climate change and its associated direct and indirect impacts. For example, children, seniors, and persons with underlying medical conditions (e.g., chronic heart disease) may be more susceptible to developing negative health outcomes from exposure to worsening air quality (CARB 2021). As discussed further below, the adverse impacts of climate change are also expected to disproportionately affect communities of color and underserved and low-income communities, which may have fewer resources to respond to changing conditions (Milanes et al. 2018).

To adapt to an uncertain future, California planners will need to anticipate climate change risks and build communities that remain resilient in the face of a changing

B3 Attach #1 of 3

climate. The resources and guidance presented in the Handbook provide tools to support resilient planning.

Social Environment and Public Health

Exposure to Environmental Burdens

Underserved and low-income communities have historically suffered from disproportionately higher rates of pollution and other environmental hazards compared to more affluent communities. Socioeconomic determinants of public health—like educational attainment, housing costs, linguistic isolation, poverty, and unemployment rates—are shaped by public policy and planning. Past exclusionary housing and planning practices segregated and redlined certain populations. These policies made it more difficult for communities of color and low-income and immigrant populations to access critical resources necessary to support healthy, thriving, and prosperous lives.

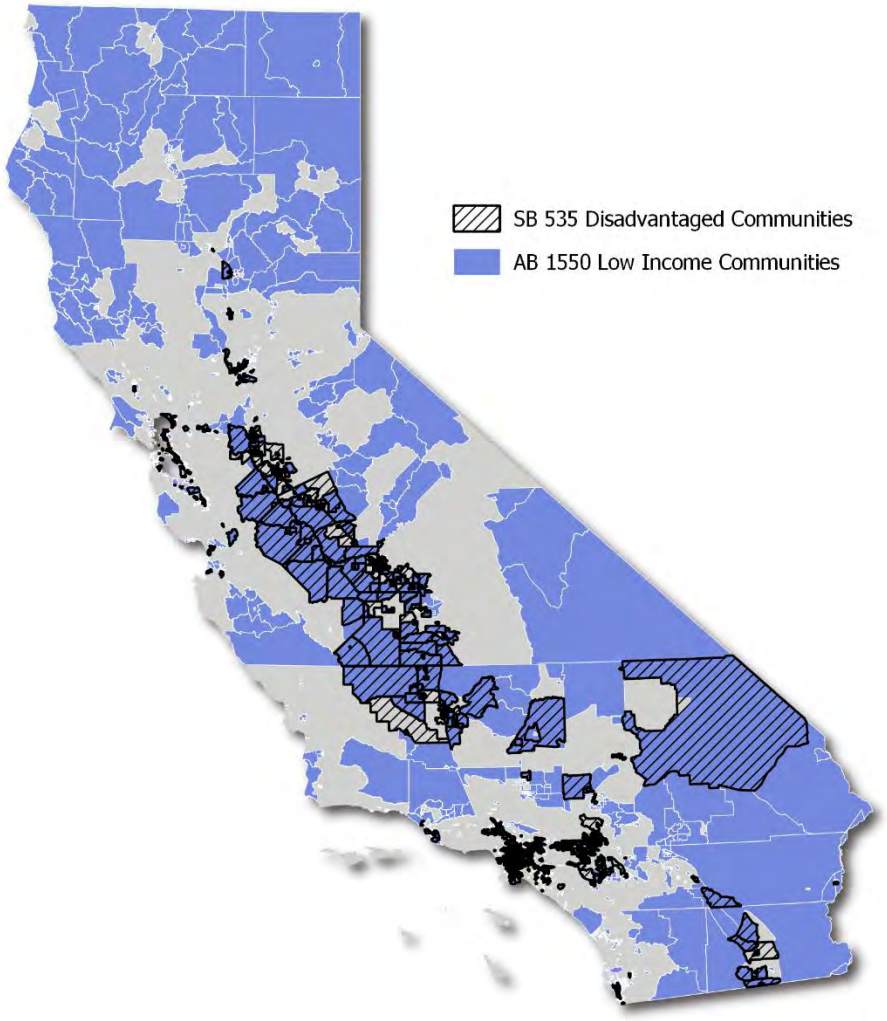
CalEPA designates *disadvantaged communities* as the 25 percent highest scoring census tracts using results of CalEnviroScreen. *Low-income communities* are census tracts with median household incomes at or below 80 percent of the statewide median income or at or below the state income limit threshold.

Structural and institutional racism continue to persist and shape California communities. Nearly one-quarter of children under 5 years old in California are currently living in poverty (August et al. 2021). Low-income populations often reside in neighborhoods that score among the lowest for key environmental and social indicators, such as access to clean water (Urban Environment & Social Inclusion Index 2021).The California Environmental Protection Agency (CalEPA) designates communities in California as disadvantaged or low-income for the purposes of allocating climate investments. Figure 2-1 shows these communities and highlights the considerable number of locations currently designated as disadvantaged, low-income, or both (CalEPA 2021).

The impacts of disproportionate exposure to environmental burdens are often felt at the individual, household, and community level (Gochfeld and Burger 2011; Katz 2012). For example, studies have found that low-income individuals have higher rates of hospitalization and greater risk of mortality when exposed to air pollution (Cakmak, Dales, and Judek 2006; Finkelstein et al. 2003). Communities with lower levels of education have higher rates of respiratory illnesses, such as childhood asthma, because of greater exposure to air pollution (August et al. 2021). Unemployment and poverty may also force individuals to live in areas with greater levels of environmental degradation (August et al. 2021). These disparities can magnify and exacerbate the spread and impact of disease and environmental disasters, as evidenced most recently by COVID-19: individuals of color have been hospitalized with COVID-19 at 3 to 4 times the rate of white

persons and have fatality rates about 2 to 2.5 times greater, according to the Centers for Disease Control and Prevention (CDC) (2021).

Figure 2-1. CalEPA Designated Disadvantaged and Low-Income Communities in California[1]



Improving conditions in communities over-burdened by pollution and other environmental hazards will require targeted and systematic changes in funding and policy priorities. The resources and guidance presented in this Handbook provide tools to support more equitable planning.

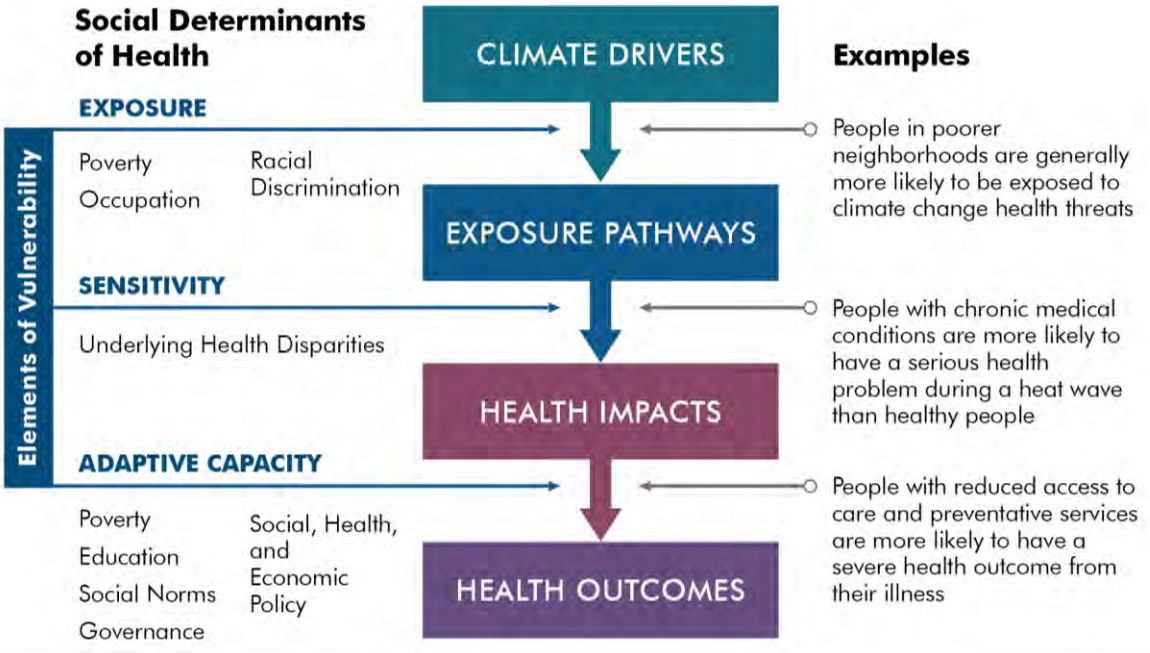
[1] Senate Bill 535-designated disadvantaged communities represent the 25% highest scoring census tracts in CalEnviroScreen, version 3.0.

Vulnerability to Climate Change

Underserved communities are expected to be disproportionally affected by the health, economic, and physical consequences of climate change. Individuals in these communities are likely to face a double threat from climate change to their health: they have higher exposure to climate hazards and have higher sensitivity to environmental stressors (August et al. 2021). Factors that contribute to higher exposure include occupation, time spent in risk-prone locations, ability to respond to extreme events, socioeconomic status, and the condition of community infrastructure (Gamble et al. 2016). Communities of color, low-income communities, outdoor workers, those with limited English language skills, children, the elderly, and people who are unhoused are all groups with higher vulnerability to climate hazards (Ebi et al. 2018; Gamble et al. 2016). These populations already experience higher rates of chronic medical conditions that can be worsened by climate change (Gamble et al. 2016).

Figure 2-2, which has been adapted from Gamble et al. (2016), illustrates the intersection of various social determinants on health and vulnerability to climate change. Implementing policies and processes to address underlying social factors that exacerbate health outcomes from climate exposures will improve the overall resilience and wellbeing of our communities.

Figure 2-2. Intersections of Social Determinants on Health and Vulnerability



Various tools and resources are available to help decisionmakers prioritize people and places for investments based on combined climate and health vulnerability. The California Department of Public Health's (2020) *Climate Change and Health Vulnerability Indicators for California* identifies the following three categories of indicators.

- Exposure indicators: heat, air quality, drought, wildfires, and sea level rise
- Population sensitivity indicators: children and elderly, poverty, education, race and ethnicity, outdoor workers, vehicle ownership, linguistic isolation, disability, health insurance, and violent crime rate
- Adaptive capacity indicators: air conditioning ownership, tree canopy, impervious surfaces, and public transit access.

CCHVIz is an online platform that allows users to visualize the indicator data across California (CDPH n.d.). Indicators are available at the census tract level or the next smallest scale available, such as the county or regional level.

The California Healthy Places Index (HPI) developed by the Public Health Alliance of Southern California (2021) showcases community conditions that predict life expectancy and can be used to compare and explore factors influencing health by census tract across California. The HPI reflects a combination of 25 community characteristics that are weighted and validated against life expectancy. Climate change exposures, social vulnerability, and adaptive capacity indicators are included as separate "decision support" layers that can be overlaid with the HPI map and scores. The indicators are grouped into eight policy action areas (economic, education, transportation, social, neighborhood, housing, clean environment, and healthcare access). Detailed policy guides offer specific solutions for healthier communities.

Federal and State Planning Efforts

Regulations are essential to helping economies and societies prosper. They provide structure and limits for government agencies, businesses, civil society organizations, and citizens. They also help realize public benefits like increased safety, improved health, economic opportunities, and fairness. Regulations often set goals to guide future planning and development efforts and create strategies and mechanisms to achieve those goals.

This section describes important federal and state regulations, policies, and legislation related to GHG emissions reductions, climate change vulnerability and adaptation, and social equity. These various requirements directly influence and inform planning efforts across California and are important to consider when reviewing measures in later chapters. Appendix B, *Federal and State Planning Framework*, provides greater detail on these efforts and resources for further reading.

The regulatory landscape is constantly shifting as amendments, revocations, and new requirements are adopted. The text in this section was drafted in 2021 and reflects the regulatory landscape as of this date. Readers may need to conduct additional research to ensure they have the latest information. Potential resources that may be consulted to provide updated information include the State's Adaptation Clearinghouse, the Alliance of Regional Collaboratives for Climate Adaptation legislative tracking site, and the Berkeley Law California Climate Policy Dashboard.

Federal Regulations and Requirements

There is no comprehensive federal law specific to climate change, societal equity, or the reduction of GHG emissions. However, in 2021, the United States rejoined the Paris Agreement to reduce national GHG emissions and the federal government submitted the United States' *Nationally Determined Contribution (NDC)*, which aims to reduce national GHG emissions by 50 to 52 percent by 2030 from 2005 levels. The NDC, executive orders, and other goals and efforts of the Biden Administration make up a new "whole-of-government" approach to reduce GHG emissions, increase climate resilience, improve equity, and boost economic growth (White House 2021a).

Clean Air Act and Greenhouse Gases

The federal *Clean Air Act (CAA)* was enacted in 1963 and has been amended numerous times since, most recently in 1990. The CAA established federal national ambient air quality standards (NAAQS) for six criteria pollutants and specifies future dates for achieving compliance. These standards were set to improve air quality and public health outcomes. For local areas not meeting those standards, states must submit and implement a State Implementation Plan that demonstrates how the standards will be met (U.S. EPA 2021).

In 2009, the U.S. Environmental Protection Agency (U.S. EPA) released its final *Greenhouse Gas Reporting Rule (Reporting Rule)*. The Reporting Rule is a response to the 2008 Consolidated Appropriations Act, which required U.S. EPA to develop mandatory reporting of GHGs above appropriate thresholds. The rule applies to most entities that emit 25,000 metric tons of carbon dioxide equivalent or more per year. Starting in 2010, facility owners were required to annually report their GHG emissions (U.S. EPA 2016).

U.S. EPA signed the *Endangerment Finding* and *Cause or Contribute Finding for Greenhouse Gases* under Section 202(a) of the CAA in 2009. Under the Endangerment Finding, EPA found that the current and projected concentrations of the six key GHGs—carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), perfluorinated carbons (PFCs), sulfur hexafluoride (SF_6), and hydrofluorocarbons (HFCs)—in the atmosphere threaten the public health and welfare of current and future generations (U.S. EPA 2020).

Fuel Efficiency Standards

The *Corporate Average Fuel Economy (CAFE)* standards were first enacted in 1975 to reduce energy consumption by improving the fuel economy of vehicles. The standards set fleet-wide averages that each automaker must meet. By improving the fuel efficiency of

vehicles, the standards improve national energy security, save consumers money, and reduce GHG emissions.

In 2011, the U.S. EPA and the National Highway Traffic Safety Administration (NHTSA) issued a *Final Rule for Phase 2 GHG Emissions Standards and Fuel Efficiency Standards for Medium- and Heavy-duty Engines and Vehicles*. This rule includes three regulatory categories of heavy-duty vehicles—combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles—and applies to model years 2014–2018. Phase 2 of these standards were established in 2016 for model years 2019–2027 (U.S. EPA 2020b).

The passenger vehicle standards were updated in 2012 CAFE for model years 2017–2025 to incorporate stricter fuel economy requirements that required new passenger cars and light trucks to reach 54.5 miles per gallon by 2025. The program also included incentives to encourage adoption of new technologies to improve vehicle performance, such as electric vehicles (U.S DOT 2014).

In 2018, the *Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule* was proposed, which would amend prior CAFE and GHG emissions standards and create new standards for model year 2021–2026 vehicles and reduce fuel economy requirements. In September 2019, NHTSA and U.S. EPA established "The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program," which withdrew California's ability to create its own fuel economy standards under the CAA. The rule was finalized in 2020.[2] The SAFE rule has been legally challenged by California and many other states (NHTSA 2020). On April 22, 2021, NTHSA issued a notice of proposed rulemaking to repeal the SAFE Vehicles Rule (49 Code of Federal Regulations Parts 531 and 533). The public comment period for this repeal concluded on June 11, 2021.

Environmental Planning

Signed in 1970, the *National Environmental Policy Act (NEPA)* was enacted to minimize the negative environmental impacts of new development. It requires federal agencies to incorporate environmental considerations (including related social and economic effects) into planning and decision-making processes through a systematic interdisciplinary approach (U.S. EPA 2020).

Environmental Justice and Equity

Title VI of the Civil Rights Act of 1964 specifically prohibits discrimination based on race, color, or national origin by any program or activity that receives federal funds. All federal agencies help execute the provisions of Title VI. Violators of the act may lose federal funding for projects or programs.

Executive Order 12898, signed in 1994, directs all federal agencies to make achieving environmental justice part of their mission. Agencies are directed to identify and address

[2] CARB's EMFAC2021 accounts for future fuel economy and emissions impacts of the SAFE Vehicles Rule. While prior versions of EMFAC, including EMFAC2014 and EMFAC2017, do not account for the rule, CARB (2019a, 2020) has published off-model adjustment factors that can be used to adjust emissions output from EMFAC2014 and EMFAC2017.

disproportionately high and adverse human health or environmental effects of agency programs, policies, and activities on minority and low-income populations.

Pursuant to Executive Order 12898, the Council on Environmental Quality (CEQ) issued *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations* to help agencies carry out the order. The guidance includes six principles for environmental justice analyses and provides guidance for how to assess human health or environmental effects on low-income, minority, and tribal communities (CEQ 1997). Following this guidance, federal agencies have developed plans and strategies to address environmental justice through agency actions.

In 2021, President Biden signed *Executive Order 13985*, which advances racial equity by addressing issues that have historically created inequity and advances civil rights, social justice, and equal opportunity. It declares that the government will address historic failures to invest sufficiently, justly, and equally in underserved communities, and will increase investment in underserved communities by promoting equitable delivery of government benefits and opportunities (White House 2021b).

The Soul Consoling Tower was built by Ryozo Kado in 1943 to remember the lives lost at the Manzanar War Relocation Center, where over 11,000 Japanese Americans were imprisoned during World War II by Executive Order 9066.

Also signed in 2021, *Executive Order 13990* recommits the executive branch to using scientific evidence in decision-making processes to advance public health and environment outcomes. More specifically, it states the administration's intent to ensure clean air and water, limit pollution and hold polluters responsible, reduce exposure to toxic chemicals, enhance environmental justice, and create well-paying union jobs. It also requires federal agencies to review federal regulations and actions that conflict with these objectives, with input from environmental justice organizations and other stakeholders (White House 2021c).

State Regulations and Rules

California has adopted numerous statewide laws, regulations, and policies to address GHG emissions reductions, climate adaptation, and equity. California has been a trailblazer and standard setter for climate-related regulations and programs. For example, California passed the Pavley 1 rule in 2002, which set the nation's first GHG standards for automobiles, and the state's GHG cap-and-trade program was the first multi-sector cap-and-trade program for GHG emissions in North America.

GHG Reduction Goals and Strategies

Executive Order S-3-05, signed in 2005, states that California is vulnerable to the effects of climate change and to help mitigate it, establishes GHG emissions reduction targets for

state agencies and requires the CalEPA to report the impacts of global warming on California and progress be made toward reducing GHG emissions through 2050 (Office of Governor 2005).

In 2006, *Assembly Bill 32, the California Global Warming Solutions Act of 2006*, established a cap on statewide GHG emissions and created a regulatory framework to reduce emissions to 1990 levels by 2020, which has been achieved. The California Air Resources Board (CARB) adopted a *GHG cap-and-trade program* in 2011 as a key mechanism to reduce GHG emissions and achieve California's GHG reduction goal. The cap-and-trade program created a market-based system that set an overall emissions limit (a "cap") for specific sectors, which is reduced annually. Revenues from the program are appropriated to state agencies to implement programs that reduce GHG emissions (C2ES n.d.). The cap-and-trade program was initially slated to sunset in 2020 but the passage of *Senate Bill (SB) 398* in 2017 extended the program through 2030.

Executive Order B-30-15, signed in 2015, established the connection between reducing GHG emissions to limit future climate change and adapting to current and future climate change impacts. It set a statewide interim GHG reduction target to reduce GHG emissions by 40 percent below 1990 levels by 2030 (Office of the Governor 2015). *SB 32* (passed in 2016) legislatively adopted this 2030 target. CARB adopted the *2017 Climate Change Scoping Plan* in November 2017 to meet the GHG reduction requirement set forth in SB 32. CARB is currently working on the *2022 Scoping Plan Update* that will assess progress toward achieving the 2030 target and outline a path to achieving carbon neutrality by midcentury.

Executive Order B-55-18 set a new state goal to achieve carbon neutrality as soon as possible (and no later than 2045) and to achieve and maintain net negative emissions thereafter. It also states that all policies and programs undertaken to achieve the goal should support climate adaptation, resource conservation, biodiversity, and improve public health in urban and rural communities, particularly low-income and underserved communities (Office of Governor 2018).

Complementary to the state's larger GHG reduction goals, *SB 605* (2014) directed CARB, in coordination with other State agencies and local air districts, to develop a comprehensive *Short-Lived Climate Pollutants (SLCP) Reduction Strategy*. SLCPs include CH_4, HFC, and anthropogenic black carbon. These pollutants have relatively short atmospheric lifetimes but much greater influence on the climate, compared to CO_2. *SB 1383* directed CARB to approve and implement the SLCP Reduction Strategy to achieve specific SLCP reduction targets. CARB adopted the SLCP Reduction Strategy in March 2017 as a framework for achieving the reduction targets set by SB 1383 (BAAQMD 2020).

Clean Energy and Conservation

SB 1078 (2002) and SB 107 (2006), California's *Renewables Portfolio Standard (RPS)* obligates investor-owned utilities (IOUs), energy service providers (ESPs), and Community Choice Aggregations (CCAs) to increase the proportion of energy generated from renewable energy sources. The most recent RPS target was established by SB 100 in 2018, which set a target to source 60 percent of energy from renewables by 2030 and

mandated 100 percent of electricity come from carbon-free energy sources by 2045 (California Legislative Information 2018).

The California Green Building Standards Code (Part 11, Title 24), known as *CALGreen*, was adopted in 2007 as part of the California Building Standards Code. The code includes voluntary and mandatory standards related to sustainable site development, energy efficiency, water conservation, material conservation, and reducing internal air contaminants (California Building Standards Commission 2019). *SB 350*, which was signed in 2015, requires a doubling of energy efficiency (electrical and natural gas) by 2030, including improvements to the efficiency of existing buildings. As of the writing of this Handbook, the 2019 standards are the latest CALGreen standards. The 2022 standards are in development and will take effect on January 1, 2023.

The State has made water conservation a priority. The *California Water Action Plan* was developed by CNRA in 2016 and sets forth a collection of actions to improve reliable water supply, restore the state's ecosystems, and build a resilient and sustainable water resource system. The Water Action Plan also emphasizes diversified regional supply portfolios to increase resiliency to droughts, floods, population growth, and climate change (CNRA 2016).

Mandatory recycling requirements to reduce landfilled waste and associated GHG emissions were originally established in 2011 through *AB 341*. *AB 1826* was passed in 2014 and requires businesses that generate two cubic yards per week of solid waste (beginning on January 1, 2020) to arrange for recycling services for organic waste (e.g., food and lawncare waste).

In 2019, CARB and other state agencies jointly released the *2030 Natural and Working Lands Climate Change Implementation Plan.* The plan outlines specific conservation, restoration, and management activities that will improve resiliency, maintain a natural carbon sink, and improve environmental quality. The plan sets a 2030 goal to at least double the pace and scale of state-supported land activities by 2030 and beyond, among other goals. The plan estimates that these activities will increase emissions by 12.4-35.9 $MMTCO_2e$ by 2030 and reduce emissions by 83.1–84.2 $MMTCO_2e$ by 2045 (CARB 2019b).

Vehicle Fuel Efficiency

Pavley I (AB 1493) set the nation's first GHG standards for automobiles and required CARB to adopt vehicle standards that lower GHG emissions from new light-duty vehicles to the maximum extent feasible beginning in 2009 (CARB 2021a). In 2012, CARB

B3 Attach #1 of 3

strengthened the Pavley standards through the *Advanced Clean Cars* regulations, which limit GHG emissions from passenger vehicles for model years 2017–2025 (CARB 2021b).

Executive Order S-01-07 establishes a statewide goal to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020. In 2018, CARB passed amendments to the Low Carbon Fuel Standard that set a target to reduce fuel carbon intensity by 20% by 2030, compared to a 2010 baseline (CARB 2018b).

The *Innovative Clean Transit (ICT) regulation* requires all public transit agencies to gradually transition to 100 percent zero-emission bus fleets by 2040. Large and small transit agencies must submit their ZEB rollout plans by July 1, 2020 and July 1, 2023, respectively. State funding to transit agencies is contingent upon the agencies' compliance (CARB 2021d). To further accelerate the transition of zero-emission heavy-duty vehicles, CARB adopted the *Advanced Clean Truck Regulation* in June 2020. The regulation requires the sale of zero-emission medium-and-heavy-duty vehicles as an increasing percentage of total annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales must be 55 percent of Class 2b–3 truck sales, 75 percent of Class 4–8 straight truck sales, and 40 percent of truck tractor sales. By 2045, every new medium-and-heavy-duty truck sold in California will be zero-emission (ICCT 2020). This effort is currently in litigation.

Climate Adaptation

Executive Order S-13-08 requires the California Natural Resources Agency (CNRA) to develop a *Climate Adaptation Strategy* (CAS) in partnership with local, regional, state, and federal entities. It also required the development of a California Sea Level Rise Assessment Report that is reviewed every two years. Among other directives, it directs state agencies planning construction projects to assess the vulnerability to sea level rise and other climate change impacts (Adaptation Clearinghouse 2008). In 2009, California adopted a statewide CAS that summarized climate change impacts and recommended adaptation strategies for seven sectors.

Executive Order B-30-15 requires the CNRA update the state's CAS every 3 years and orders state agencies to take current and future climate impacts into account in all planning and investment decisions (Office of Governor 2015). In 2018, the CNRA updated the CAS to describe ongoing climate actions and recommend cost-effective and achievable next steps to respond to climate change in 11 sectors (CNRA 2018).

SB 246 establishes an integrated climate adaptation and resiliency plan to coordinate regional and local efforts with state strategies. The program emphasizes climate equity considerations throughout all sectors and regions to help develop holistic strategies for climate adaptation (California Legislative Information 2015). As a result of SB 246, in 2020, a new version of the *California Climate Adaptation Planning Guide* was developed by the California Emergency Management Agency and CNRA to include new requirements for local adaptation planning.

SB 379 ensures that climate adaptation is integrated into local jurisdictions' general plan processes. It requires California cities and counties to integrate climate adaptation into the safety element of their general plans by conducting a vulnerability assessment to identify local climate change risks and then develop adaptation and resilience goals, policies, objectives, and implementation measures based on the assessment (OPR 2017). Furthermore, *SB 1035* requires local planning agencies to review and revise the safety element of city or county general plans as necessary to address new climate adaptation risks and resiliency strategies. Planning agencies must do this during each revision of the housing element of the general plan or a local hazard mitigation plan, and not less than once every 8 years (California Legislative Information 2018b).

The State Water Resources Control Board has taken a variety of actions to respond to climate change, including the adoption of the *Comprehensive Response to Climate Change*. It requires the State Water Board to integrate proactive measures to respond to climate change in all its actions. The resolution also outlines specific measures to reduce GHG emissions, improve ecosystem resilience, and respond to climate change impacts (State Water Board 2017).

In response to the increasing frequency and intensity of wildfires across California, the *Wildfire Preparedness and Response* bill was signed in 2018. It allocates $200 million annually from 2019-2024 to fund grants to fire departments, cities, counties, and nonprofit organizations to help reduce forest fuel loads with thinning and prescribed burns in high-risk areas. The California Department of Forestry and Fire Protection (CalFire) distributes the funding and provides technical assistance. The bill also requires utilities to create and implement wildfire mitigation plans (Adaptation Clearinghouse 2018).

The California Coastal Commission adopted the *Sea Level Rise Policy Guidance* in 2015 and an update in 2018. The guidance provides an overview of the sea level rise science and broad recommendations for how to plan for and address sea level rise impacts. The guidance is broadly applicable and is used by the Coastal Commission, local governments, project applicants, and other stakeholders. The Coastal Commission describes the guidance as "a menu of options" that local planners can select from as appropriate, rather than a checklist of requirements (CCC 2019).

Social Equity

SB 1000 requires cities and counties with disadvantaged communities to include an environmental justice element in their general plans to ensure that local governments address environmental justice when planning long-term land use and growth goals and policies. Local governments must identify any disadvantaged communities and develop measures to mitigate and reduce health risks that can be attributed to the environment

(Strategic Growth Council 2021). *SB 32* (discussed above) also includes an environmental justice component that requires GHG reduction targets to be met in a way that benefits the most disadvantaged communities (California Legislative Information 2016a). The *GHG cap-and-trade program* (discussed above) requires 35 percent of program revenue to be directed toward environmentally disadvantaged and low-income communities (California Legislative Information 2016a).

AB 2722 was signed in 2016 to help create more sustainable cities, to address climate justice, and to help California meet its GHG emissions reduction goals. To achieve this, the California Strategic Growth Council created the Transformative Climate Communities program, which issues grants to develop and implement transformative climate plans. The funds are used to create and implement cross-cutting community plans that improve air and water quality, reduce emissions, and provide climate, economic, employment, and health benefits to disadvantaged communities (California Legislative Information 2016b).

AB 617 requires the State to develop a statewide annual reporting system for emissions of criteria air pollutants and toxic air contaminants for certain stationary sources. It also requires the State to prepare a monitoring plan for emissions and to prepare a statewide strategy to reduce emissions of toxic air contaminants and criteria pollutants in communities that experience a high cumulative exposure burden, in consultation with environmental justice groups and other stakeholders. (California Legislative Information, 2017). In response, CARB established the *Community Air Protection Program (CAPP)*, which focuses on reducing pollution exposure to communities that are most affected by air pollution. The CAPP provides funds for deploying clean technologies in communities and to retrofit pollution controls on industrial sources (CARB 2021c).

Planning Guidance

Photo Credit: Port of San Francisco, March 2019

The *California Environmental Quality Act (CEQA)* guidelines, first established in 1970, explain how to determine if an activity is subject to environmental review, what steps are involved in the process, and what documents are required. With respect to GHG emissions, the guidelines require agencies to describe, calculate, or estimate the amount of GHG emissions that are expected to result from a project. They also require a determination of whether a project would exacerbate physical climate change effects (OPR 2021). *SB 743* required revisions to the CEQA Guidelines (which occurred in 2018 and became effective in 2020) to establish new impact analysis criteria for the assessment of a project's transportation impacts. The intent behind SB 743 and revising the CEQA Guidelines was to integrate and better

balance the needs of congestion management, infill development, active transportation, and GHG emissions reduction (Caltrans 2021).

SB 375 provides a planning process that coordinates land use planning, regional transportation plans, and funding priorities to help California meet its GHG reduction goals. SB 375 requires regional transportation plans developed by metropolitan planning organizations to incorporate a sustainable communities strategy (SCS) in their regional transportation plans (Institute for Local Government 2015). The goal of the SCS is to reduce regional vehicle miles traveled through land use planning and transportation planning.

Building Future Equity and Resilience through Better Planning

As discussed in *Social and Environment and Public Health*, underserved and low-income communities and communities of color experience disproportionate environmental and climate change impacts. It is important that resources be targeted to historically over-burdened communities when planning for an equitable and climate-resilient future. Equally, decisionmakers must consider potential unintended consequences that may arise from implementation of emission reduction or adaptation measures. Striving for equity may also mean considering non-traditional measures that create socioeconomic co-benefits.

Planners can support more equitable development by engaging directly with local communities. Community-driven processes allow community members and organizations to set adaptation priorities and influence investments, identify inequities in planning, direct resources to the most at-risk areas and groups, and promote democracy and transparency in government (Georgetown Climate Center 2017).

The GHG emission reduction and climate adaptation measure descriptions presented in Chapters 3 and 4 include equity considerations. Chapter 5, *Measures for Advancing Health and Equity*, presents a non-exhaustive list of measures, examples, and resources to promote future health and equity in project and community planning. Chapter 6, *Resources to Support Resilient and Equitable Emission Reduction Planning*, provides resources and guidance on incorporating equity into resilient planning.

Measures to Reduce GHG Emissions

CHAPTER 3

The California Air Pollution Control Officers Association (CAPCOA) has included a wide range of measures that are frequently used to reduce greenhouse gas (GHG) emissions and provide other benefits, like improved air quality, energy and fuel savings, and water conservation. This chapter provides methods and data to quantitively evaluate many of the measures. While there is no one-size-fits-all approach to GHG planning, the guidance presented in this chapter has been developed to broadly apply across project types, land use types, and California regions.

Categorizing Measures

When thinking about minimizing GHG emissions in a community or for a project, it is useful to organize GHG reduction measures into categories. The standard method of categorizing emissions is to group them by economic sector, such as transportation or energy. Consistent with this practice, the emission reduction measures presented in this chapter are categorized into the following nine sectors. Measures in each sector apply to a similar emissions source or process, as described below.

B3 Attach #1 of 3

- Transportation: Measures that promote transit and alternative transportation, support use of alternatively fueled vehicles, or encourage land use planning practices that reduce vehicle trips and vehicle miles traveled (VMT). Measures within the transportation sector are separated into six subsectors: Land Use, Neighborhood Design, Parking or Road Pricing/Management, Transit, Trip Reduction Programs, and Clean Vehicles and Fuels.
- Energy: Measures that target energy efficiency improvements/reduced natural gas consumption, renewable energy generation, building electrification, or methane (CH_4) recovery at landfills and wastewater treatment plants.
- Water: Measures that reduce water demand and/or use a less energy-intensive water source.
- Lawn and Landscaping: Measures that promote zero-emission landscaping equipment over conventional fossil fuel-powered counterparts.
- Solid Waste: Measures that require alternative waste management pathways, such as recycling and composting, to increase landfill waste diversion.
- Natural and Working Lands: Measures that enhance the sequestration capacity of natural lands or reduce the intensity of emissions from working lands.
- Construction: Measures that promote efficient construction management practices or alternatively fueled construction equipment.
- Refrigerants: Measures to reduce or replace high global warming potential (GWP) refrigerants with lower impact compounds.
- Miscellaneous: General measures that will reduce GHG emissions through the implementation of novel or off-site projects defined by the user.

EMISSIONS SECTORS

Categorizing emissions by sector is standard practice for GHG inventories and reduction plans, but users should note that there is often variation in the scope and nomenclature of sectors. For example, the sectors in this Handbook do not align exactly with the California Air Resources Board or U.S. Environmental Protection Agency inventories because of differences in scale and intended use. Users should take care when comparing sectors in this Handbook to other inventories or plans.

The nine emission sectors are illustrated in Figure 3-1. The figure shows all quantified GHG reduction measures included in this chapter. Users may click on an individual measure to navigate directly to the quantification method for that measure. Figure 3-1 does not include non-quantified measures. These measures are presented later in this chapter in *Supporting or Non-Quantified GHG Reduction Measures*.

B3 Attach #1 of 3

Figure 3-1. Navigation Trees for Quantitative GHG Reduction Measures

Transportation

LAND USE

- T-1. Increase Residential Density
- T-2. Increase Job Density
- T-3. Provide Transit-Oriented Development
- T-4. Integrate Affordable and Below Market Rate Housing
- T-17. Improve Street Connectivity

TRIP REDUCTION PROGRAMS

- T-5. Implement Commute Trip Reduction Program (Voluntary)
- T-6. Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring)
- T-7. Implement Commute Trip Reduction Marketing
- T-8. Provide Ridesharing Program
- T-9. Implement Subsidized or Discounted Transit Program
- T-10. Provide End-of-Trip Bicycle Facilities
- T-11. Provide Employer-Sponsored Vanpool
- T-12. Price Workplace Parking
- T-13. Implement Employee Parking Cash-Out
- T-23. Provide Community-Based Travel Planning

PARKING OR ROAD PRICING/MANAGEMENT

- T-14. Provide Electric Vehicle Charging Infrastructure
- T-15. Limit Residential Parking Supply
- T-16. Unbundle Residential Parking Costs from Property Cost
- T-24. Implement Market Price Public Parking (On-Street)

NEIGHBORHOOD DESIGN

- T-18. Provide Pedestrian Network Improvement
- T-19-A. Construct or Improve Bike Facility
- T-19-B. Construct or Improve Bike Boulevard
- T-20. Expand Bikeway Network
- T-21-A. Implement Conventional Carshare Program
- T-21-B. Implement Electric Carshare Program
- T-22-A. Implement Pedal (Non-Electric) Bikeshare Program
- T-22-B. Implement Electric Bikeshare Program
- T-22-C. Implement Scootershare Program

TRANSIT

- T-25. Extend Transit Network Coverage or Hours
- T-26. Increase Transit Service Frequency
- T-27. Implement Transit-Supportive Roadway Treatments
- T-28. Provide Bus Rapid Transit
- T-29. Reduce Transit Fares

CLEAN VEHICLES AND FUELS

- T-30. Use Cleaner-Fuel Vehicles

Energy

ENERGY EFFICIENCY IMPROVEMENTS

- E-1. Buildings Exceed 2019 Title 24 Building Envelope Energy Efficiency Standards
- E-2. Require Energy Efficient Appliances
- E-3-A. Require Energy Efficient Residential Boilers
- E-3-B. Require Energy Efficient Commercial Packaged Boilers
- E-4. Install Cool Roofs and/or Cool Walls in Residential Development
- E-5. Install Green Roofs in Place of Dark Roofs
- E-6. Encourage Residential Participation in Existing Demand Response Program(s)
- E-7. Require Higher Efficacy Public Street and Area Lighting
- E-8. Replace Incandescent Traffic Lights with LED Traffic Lights
- E-9. Utilize a Combined Heat and Power System

RENEWABLE ENERGY GENERATION

- E-10-A. Establish Onsite Renewable Energy Systems—Generic
- E-10-B. Establish Onsite Renewable Energy Systems—Solar Power
- E-10-C. Establish Onsite Renewable Energy Systems—Wind Power
- E-11. Procure Electricity from Lower Carbon Intensity Power Supply

BUILDING DECARBONIZATION

- E-12. Install Alternative Type of Water Heater in Place of Gas Storage Tank Heater in Residences
- E-13. Install Electric Ranges in Place of Gas Ranges
- E-14. Limit Wood Burning Devices and Natural Gas/Propane Fireplaces in Residential Development
- E-15. Require All-Electric Development
- E-16. Require Zero Net Energy Buildings
- E-17. Require Renewable-Surplus Buildings

METHANE RECOVERY

- E-18. Establish Methane Recovery in Landfills
- E-19. Establish Methane Recovery in Wastewater Treatment Plants

Water

- W-1. Use Reclaimed Non-Potable Water
- W-2. Use Grey Water
- W-3. Use Locally Sourced Water Supply
- W-4. Require Low-Flow Water Fixtures
- W-5. Design Water-Efficient Landscapes
- W-6. Reduce Turf in Landscapes and Lawns
- W-7. Adopt a Water Conservation Strategy

Lawn and Landscaping

- LL-1. Replace Gas Powered Landscape Equipment with Zero-Emission Landscape Equipment

Solid Waste

- S-1. Institute or Extend Recycling Services
- S-2. Implement Organics Diversion Program

Natural and Working Lands

- N-1. Create New Vegetated Open Space
- N-2. Expand Urban Tree Planting
- N-3. Implement Management Practices to Improve the Health and Function of Natural and Working Lands
- N-4. Require Best Management Practices for Manure Management

Construction

- C-1-A. Use Electric or Hybrid Powered Equipment
- C-1-B. Use Cleaner-Fuel Equipment
- C-2. Limit Heavy-Duty Diesel Vehicle Idling
- C-3. Use Local Construction Contractors

Refrigerants

- R-1. Use Alternative Refrigerants Instead of High-GWP Refrigerants
- R-2. Install Secondary Loop and/or Cascade Supermarket Systems in Place of Direct Expansion Systems
- R-3. Install Transcritical CO_2 Supermarket Systems in Place of High-GWP Systems
- R-4. Install Microchannel Heat Exchangers in A/C Equipment in Place of Conventional Heat Exchanger
- R-5. Reduce Service Leak Emissions
- R-6. Reduce Operational Leak Emissions
- R-7. Reduce Disposal Emissions

Miscellaneous

- M-1. Establish a Carbon Sequestration Project
- M-2. Establish Offsite Mitigation
- M-3. Implement an Innovative Strategy for GHG Mitigation

Selecting Measures

The GHG reduction measures presented in this chapter are diverse. Users are encouraged to carefully review the measure factsheets to determine which measures are most applicable to their project and capable of achieving their GHG reduction goals. There are several reasons a user might implement measures to reduce GHG emissions. Some measures may be implemented voluntarily, simply because users are seeking to reduce their GHG footprint. Other users may be obligated under law or statute to mitigate current or future impacts of specific actions or activities. This can include project-level impacts, such as those evaluated under the California Environmental Quality Act (CEQA), or plan-level impacts, such those resulting from the implementation of a general plan or climate action plan.

When considering which measures are applicable from the Handbook, the underlying reasons and context for reducing GHG emissions should be incorporated into the decision-making process. For example, if a user is seeking to achieve substantial GHG reductions to comply with a CEQA requirement, measures that have the greatest potential to reduce emissions may be most applicable. Or, if a city is aiming to implement a climate action plan by engaging the community, measures that inspire community members and are easily accessible and affordable may be the most applicable.

Other factors for determining measure applicability include the project type, scale, and locational context. Some measures are broad and applicable to many types of projects (e.g., Measure E-2, *Require Energy Efficient Appliances*), while others have a narrower scope of application (e.g., Measure E-19, *Establish Methane Recovery in Wastewater Treatment Plants*). Additionally, certain measures are suitable for urban environments, while others are best implemented in rural contexts. The measure factsheets presented in *GHG Reduction Measure Factsheets and Quantification Methods* later in this chapter summarize these and other important considerations for measure selection to support informed decision making.

Consideration of Measure Co-Benefits

Co-benefits, or additional benefits that often are associated with emissions reduction measures, are valuable elements of climate action planning. Citing co-benefits has become increasingly prevalent in justifying funding, planning, and implementing of emission reduction measures. Like the quantification of GHG reductions, only those benefits with literature and methodologies to support their accurate and reliable quantification are presented in this chapter. Where quantification is not achievable, co-benefits are noted qualitatively for each measure.

The co-benefit categories considered in this Handbook include the following and are visually depicted in the measure factsheets by the corresponding icons.

Improved air quality. Criteria pollutant reductions.

Energy and fuel savings. Electricity, natural gas, refrigerant, propane, gasoline, or diesel reductions.

VMT reductions. Reductions in vehicle miles traveled.

Water conservation. Water use reductions.

Enhanced pedestrian or traffic safety. Reduced collisions; pedestrian/bicyclist safety.

Improved public health. Toxic air contaminant reductions (including exposure); increased physical activity; improved public safety.

Improved ecosystem health. Improved biological diversity and soil and water quality.

Enhanced energy security. Systemwide load reduction; local energy generation, levelling out peaks.

Enhanced food security. Stability of food systems; improved household access to food.

Social equity. Address existing social inequities (e.g., housing/anti-displacement, community engagement, availability of disposable income).

This Handbook assigns co-benefits to measures that are likely to result from measure implementation; however, it should be noted that the achievement of co-benefits is not guaranteed because many co-benefits are dependent on how the measure is implemented. Determining what co-benefits apply to an individual measure in a specific circumstance is not an exact science, and there is no single methodology that can be uniformly applied for

this purpose. When considering co-benefits that may be achieved, it is best to comprehensively think through the implications of implementing that measure. For example, Measure E-12, *Install Alternative Type of Water Heater in Place of Gas Storage Tank Heater in Residences,* reduces GHG emissions because it eliminates the onsite combustion of natural gas. Because combusting natural gas also results in emissions of other air pollutants that can cause adverse health effects, this measure would also improve air quality and achieve public health benefits. These co-benefits would be achieved by the measure in all project applications. Depending on where and how the measure is implemented, it may also address disparities in social equity and protect a homeowner or renter from rapid changes in fossil fuel prices, especially if solar energy is produced locally or on site. Users are encouraged to use the co-benefit icons identified for each measure as a starting point for this type of thought exercise and expand or revise for their specific project or application.

Note that while all measures achieve at least one co-benefit, some measures may also yield a disbenefit. For example, measures that electrify a fossil-fuel source will lead to improved air quality and fuel savings but increased electricity consumption. Potential disbenefits are discussed, where appropriate, for individual measures.

Quantifying GHG Reductions

The emissions quantification methods in this chapter are designed to provide GHG estimates using readily available data and user-specified information. In general, emission reductions are quantified (1) as a percentage of emissions from a given source or activity, or (2) as absolute emissions reductions from a given source or activity implementation of the measure. Where appropriate, some measures refer readers to external tools to quantify GHG reductions.

Quantification methods that provide a percent reduction rely on the underlying assumption that GHG emissions are proportional to the emissions source. For example, emissions reductions achieved by transportation measures are estimated using the expected percent reduction in vehicle trips or VMT, with an associated adjustment to account for the relationship between VMT reduction and vehicle emissions, as described further in the *Transportation* section. For these measures, users will need to multiply the reduction percentage by the amount of emissions that would be generated by that source without implementation of the measure to calculate the absolute reductions.[2] This Handbook does not include methods for inventorying emissions from specific sources or under various scenarios, such as baseline or existing conditions. There are several tools and models available for inventorying project-level GHG emissions, including CAPCOA's California Emissions Estimator Model (CalEEMod).

Quantification methods that calculate absolute reductions estimate the amount of emissions that would be released as a result of the source or activity with implementation

[2] The reduction percentage is denoted as a positive value when specified in text or in tables as a "reduction," and is denoted as a negative value when calculated in equations.

B3 Attach #1 of 3

of the measure (e.g., the reduction in water sector GHG emissions achieved from using reclaimed water). GHGs evaluated in this Handbook include carbon dioxide (CO_2), CH_4, nitrous oxide, and commonly used refrigerants. All GHG reductions are expressed in metric tons (MT) of carbon dioxide equivalents (CO_2e), where individual GHGs that would be reduced by a measure are converted to CO_2e by multiplying emissions by their GWP. GWP represent a ratio of the heat trapping characteristic of a gas compared to CO_2, which has a GWP of 1. This Handbook primarily uses GWPs from the Intergovernmental Panel on Climate Change's (IPCC) (2007) Fourth Assessment Report, consistent with statewide GHG emissions reporting protocol.[3] For commonly used refrigerants, GWPs were obtained from the IPCC's Fourth Assessment Report and databases from CARB and the World Meteorological Organization.

Measures presented in this chapter address those reductions over which a user can exercise direct control, as well as indirect emissions associated with electrical generation and the use of natural gas.

Quantification Accuracy and Reliability

IPCC (2006) defines *good practices* for GHG emissions quantification as those that "contain neither over- nor underestimates so far as can be judged, and in which uncertainties are reduced as far as practicable." Part of the challenge in developing methods that meet this standard of good practice is assuring the accuracy of the methods. This Handbook defines *accuracy* as the closeness of the agreement between the result of a measurement or calculation and the true value, or a generally accepted reference value. When a method is accurate, it will, for a particular case, produce a quantification of emissions that is as close to the actual emissions as can practicably be done with information that is reasonably available.

Quantification methods that meet the standard of good practice must also be *reliable*, which is different from being accurate. A reliable method will yield accurate results across a range of different cases, not only in one case. In some cases, the accuracy of quantification may be sacrificed to achieve reliability. This is because a method that can be applied across a range of scenarios must be generalized to some extent. For example, methods for transportation sector measures do not, for the most part, differentiate between peak and off-peak vehicle trips, even though off-peak trips will have a lower emission impact because of the effects of congestion on travel time and engine performance. To fully address all the factors that affect the emissions associated with vehicle trips for a specific project, a far more detailed analysis would be needed, and it would not be readily applied to other situations. The methods contained in this Handbook

[3] The Handbook uses the IPCC's (2007) Fourth Assessment Report because CARB currently (as of 2021) calculates CO_2e values for the statewide GHG inventory using GWPs from this report. GWPs are regularly reassessed by the IPCC, which published updated GWPs in their Fifth Assessment Report (IPCC 2014). Readers are encouraged to consult the latest IPCC assessment report and CARB statewide inventory guidance available at the time of their analysis to determine if alternative GWPs should be used.

have been developed to provide the best balance between accuracy and reliability, because accessibility and ease of use is an important consideration.

The quantification methods included in this Handbook will only be accurate to the degree that a project adheres to the assumptions, limitations, and other criteria specified for a given measure. Most of the quantification methods provide default assumptions for user consideration. The default values are based on the most up-to-date regional-, state-, or national-level data and may not be appropriate for all projects. Accordingly, it is recommended that defaults only be used if they adequately reflect analysis conditions, and no local or project-specific information is available. When a range of effectiveness may be quantified for a specific measure depending on defaults, this Handbook often presents those defaults that would yield the lower end of reductions to avoid overstating potential measure benefits. Where defaults are not available for a specific assumption, data must be provided by the user for the calculations to be valid. The quality of the data provided by the user will substantially affect the quality of the results achieved. Data supplied by the user could be a rough estimate, based on a small, onetime sample, or derived through a full project-specific study. Using a rough estimate for any of the data inputs will yield results that are less accurate than if higher quality data inputs are provided.

Users are encouraged to consider the intended use of the quantification, to make sure that the results achieved will be sufficiently rigorous to support the conclusions drawn from them. When quantification is performed for CEQA or other regulatory compliance, it is recommended that project-specific data be as robust as possible. Approximations and unsubstantiated numbers are discouraged. Moreover, it is strongly recommended that the source(s) and/or basis of all project-specific data supplied by the user be clearly identified in the analysis and the limitations of the data be discussed.

Measure Scales

GHG reduction measures can be applied at different scales or geographic levels. Some measures may only be applicable at the project-level, whereas others may be more appropriate within a broader planning context, such as for a general plan or climate action plan. Geographic levels considered in this Handbook include the Project/Site and Plan/Community. Project/Site refers to measures that reduce emissions at the scale of a parcel, employer, or development project. Plan/Community refers to measures that reduce emissions at the scale of a neighborhood (e.g., specific plan, general plan, climate action plan), corridor, or entire municipality (e.g., city- or county-level).

The transportation measures can be quantified at either the Project/Site scale or the Plan/Community scale, but never both. While some of the transportation measures could be implemented at both scales in practice, the quantification methods presented in this Handbook are limited to only the scale for which there is literature to defensibly support emissions quantification. For example, a bike-sharing program could be implemented at the Project/Site scale for employees to use at a business park, and it could be implemented at the Plan/Community scale by a municipality in their downtown district. However, there is limited defensible research on the GHG reductions associated with small scale, site-specific

bike-share programs. Therefore, only the Plan/Community scale version of this measure is quantified in this Handbook. The *Transportation* section notes each instance in which a transportation measure could be implemented at a scale for which this document does not provide a quantification method.

Some non-transportation measures can be quantified at both the Project/Site scale and the Plan/Community scale. For example, a multi-family development at the Project/Site scale may construct homes without wood-burning devices, while a specific plan for new single-family housing at the Plan/Community scale could require that all future homes prohibit wood-burning devices. The quantification method for this measure would be the same, regardless of the scale of application.

Combining Measure Reductions

When quantifying measures, it is important to be mindful of potential interactions among different measures. Often, combining measures can lead to better emission reductions than implementing a single measure by itself. For example, for Measure LL-1, *Replace Gas Powered Landscape Equipment with Zero-Emission Landscape Equipment*, to succeed, electrical outlets on the exterior of buildings should be accessible so that the electric landscaping equipment can be charged. Measure LL-3, *Electric Yard Equipment Compatibility,* should, therefore, be considered as a supporting action to equipment electrification. Where appropriate, these synergistic relationships are noted within the individual measure quantification methods. However, the compounding effect of combining these select measures is not quantified in this Handbook.

Unfortunately, the effects of combining some measures are not always beneficial, linear, complementary, or accurate. There are two primary reasons for this. The first reason is that there may be diminishing returns when certain measures are implemented together to reduce a particular source of emissions. For example, there may be six measures to increase ridership on a public transit line, any one of which might increase transit ridership by 20 percent. But implementing all these measures will not necessarily increase ridership by 120 percent. In fact, for each successive measure applied, it is likely that a lesser effect will be observed. The second reason is that there may be competition between measures. For example, a campaign to increase ridership on a commuter rail line may be implemented while a new public transit bus line is established with overlapping service areas. Although the ridership campaign might be expected to cause 5 percent of drivers to switch to rail, some of those potential new riders might use the new bus service instead, making the ridership campaign less effective. At the same time, the new bus line might also be expected to reduce vehicle trips by 5 percent, but the actual reduction may be lower if some of the ridership comes from rail passengers. Together, the ridership campaign for the rail line and the new bus line may only reduce vehicle trips by 7 percent, and not the 10 percent predicted from summing the estimates of their independent effectiveness.

Where appropriate, guidance for combining measure reductions is provided within the introductions to each sector. Likewise, the quantification methods for each measure identify any applicable calculation maximums.

B3 Attach #1 of 3

Combining Sector Reductions

The following procedures must be followed when combining measures among the nine sectors where the GHG reduction achieved by individual measures is calculated as a percentage of emissions from a given source or activity. Specifically, the relative magnitude of emissions between sectors must be considered. Users should first determine the percent contribution made by each individual sector to the overall project GHG emissions. This percent contribution by a sector should then be multiplied by the reduction percentages from measures in that sector to determine the scaled GHG emission reductions. This should be done for each sector to be combined. The scaled GHG emissions for each sector can then be added together to give a total GHG reduction for the combined measures in all sectors.

For example, consider a project with total GHG emissions that come from the following sectors: transportation (50 percent), building energy use (40 percent), water (6 percent), and solid waste (4 percent). This project implements transportation measures that result in a 10 percent reduction in VMT. The project also implements measures that result in a combined 30 percent reduction in water usage. The overall reduction in GHG emissions is calculated in the below example.

$\%\ \text{Reduction}_{\text{Transport}} = 50\%\ \text{total emissions} \times 10\%\ \text{sector reduction} = 5\%\ \text{total reduction}$

$\%\ \text{Reduction}_{\text{Water}} = 6\%\ \text{total emissions} \times 30\%\ \text{sector reduction} = 1.8\%\ \text{total reduction}$

$\%\ \text{Reduction}_{\text{Total}} = 5\% + 1.8\% = 6.8\%\ \text{total reduction}$

As discussed above, GHG reductions for some measures in this Handbook are expressed in terms of the absolute MT CO_2e that would be reduced. Reductions from these measures should be combined following the same approach as shown above. However, rather than multiplying percentages, users can simply subtract the expected reductions from the sector emissions.

Users may need to combine sector reductions that are a product of measures where reductions are given as both percentages and absolute values. This can be achieved by modifying the above equations to include actual project emissions. The following equations extend the above project example to include a 10 MT CO_2e reduction achieved by waste sector measures. Uncontrolled project emissions are assumed to be 2,000 MT CO_2e.

$$\text{Absolute Reduction}_{\text{Transport}} = 2{,}000\ \text{MT } CO_2e \times 50\%\ \text{total emissions} \times 10\%\ \text{sector reduction}$$

$$= 100\ \text{MT } CO_2e\ \text{reduction}$$

$$\text{Absolute Reduction}_{\text{Water}} = 2{,}000\ \text{MT } CO_2e \times 6\%\ \text{total emissions} \times 30\%\ \text{sector reduction}$$

$$= 36\ \text{MT } CO_2e\ \text{reduction}$$

$$\text{Absolute Reduction}_{\text{Waste}} = 10\ \text{MT } CO_2e$$

$$\text{Absolute Reduction}_{\text{Total}} = 100\ \text{MT } CO_2e + 36\ \text{MT } CO_2e + 10\ \text{MT } CO_2e = 146\ \text{MT } CO_2e$$

B3 Attach #1 of 3

Limitations and Uncertainty

There are uncertainties associated with any type of estimation method. It is important to understand the limitations to properly apply the quantification methods presented in this Handbook. The following briefly discusses key limitations for user awareness and consideration.

Combination of Data Sources

Developing quantification methods for some of the measures required the use of multiple sources of data. Any time data are derived from different sources, there may be slight discrepancies in the underlying methodologies and data. When the information between two data sets is combined, the discrepancies may affect the ultimate quantification of emissions, either over- or underestimating them. It is not possible to determine the precise magnitude of error that combining data sets induces in the final quantification; however, every effort has been made to minimize potential errors through thorough review of available data and exclusion of incompatible data sets.

Level of Detail for Underlying Assumptions

Many of the calculations require users to input project-specific data or assumptions. Certain information about a project may not be known to the user and must be either estimated or assumed based on standard procedures. Likewise, users may rely on the available defaults provided in the Handbook to enable emissions quantification of applicable measures. While defaults provided in this Handbook are based on credible sources for use in emissions quantification, they are often based on historical regional, state, and national-level data and may produce an inaccurate representation of project-specific conditions or lead to an overestimate or underestimate of associated emissions. This limitation can be minimized to the extent the user can provide better quality data.

Use of Case Studies

Case studies generally have detailed information on reductions that may be achieved in practice by a measure. While these studies provide valuable insight that can support measure quantification, there may be features or characteristics in the case study that do not translate to a specific project and, therefore, may over- or underestimate the GHG emission reductions. Where case studies were used, they were carefully reviewed to ensure the study methods and data meet the quality requirements of this Handbook.

Prediction of Future Behavior

Some of these methods predict future behavior (e.g., water use and energy consumption) using historical data and trends. Although this is a commonly accepted practice, current behavior is not likely to remain constant over time due to technological improvements and increasing awareness of resource conservation. This limitation can be minimized to the extent the user can provide better quality data.

B3 Attach #1 of 3

Combining Multiple Measures

Projects may involve the application of more than one measure. As discussed above, combining measures can have an additive effect on GHG reductions, or result in diminishing returns. This limitation is minimized through the establishment of sector and measure reduction caps, as described within the individual measure methods, as applicable. However, users should still exercise good judgement when selecting measures to ensure that the resulting quantification is appropriate and accurate.

Exclusion of Lifecycle and Biogenic CO_2 Emissions

Except for solid waste measures and certain measures in the refrigerants and transportation sectors, the quantification methods do not include analysis of full lifecycle emissions, which are those that are emitted from the energy and resources used throughout the lifecycle of a product or material. Lifecycle emissions include the extraction of raw resources, physical distribution, use of the product or material, and disposal at the end of a product's life. It is challenging to quantify these lifecycle emissions because identifying all the inputs that are necessary, especially for a generalized guidance document such as this Handbook, is infeasible. Because of these difficulties, lifecycle considerations are only included in the quantitative methods for those measures that cannot be quantified without a lifecycle analysis. The *Transportation*, *Solid Waste*, and *Refrigerants* sections discuss lifecycle considerations specific to those sectors. For all other measures, the quantification methods do not include analysis of full lifecycle emissions.

Except for Measure E-14, *Limit Wood Burning Devices and Natural Gas/Propane Fireplaces in Residential Development*, the methods do not address biogenic CO_2 emissions. Biogenic CO_2 emissions result from materials that are derived from living cells, as opposed to CO_2 emissions derived from fossil fuels, limestone, and other materials that have been transformed by geological processes. Biogenic CO_2 contains carbon that is present in organic materials, including wood, paper, vegetable oils, animal fat, and waste from food, animals, and vegetation (such as yard or forest waste). Biogenic CO_2 emissions are excluded from these GHG emissions quantification methods because they are the result of materials in the biological/physical carbon cycle, rather than the geological or anthropogenic carbon cycle.

Extent Reductions are Achieved in Practice

The reduction methods presented in this Handbook are based on specific underlying data and assumptions for how each measure should be implemented. The quantification methods will yield the most accurate and reliable results when the user adheres to all implementation requirements described in this Handbook. In practice, there is likely to be a wide range of how individual measures are implemented given project-specific considerations, such as cost to implement the measure, physical constraints, availability of technology, and regulatory restrictions.

B3 Attach #1 of 3

GHG Reduction Measure Factsheets and Quantification Methods

Anatomy of the Factsheets

All quantified GHG reduction measures in this Handbook include a one-page measure factsheet. The factsheet highlights important considerations for each measure. They describe the measure, locational context, scale of application, implementation requirements, cost considerations, and options to expand measure effectiveness. The factsheets also show key measure indicators, such as the GHG reduction potential, co-benefits, and considerations for climate resilience and health and equity. Where available, the GHG reduction potential is provided as the estimated maximum percent reduction in emissions. For those measures where GHG reductions are calculated as absolute emissions, the GHG reduction potential is identified as small, moderate, large, or varies. This qualitative ranking characterizes the estimated quantity of reductions relative to the magnitude of emissions generated by the source. For example, Measure E-15, *Require All-Electric Development*, has the potential for a large reduction in GHG emissions from building energy use if all end uses are electrified and the local utility provides zero-carbon electricity. It's important to note that, while this measure could achieve a "large" reduction in building energy emissions, the overall reduction in project emissions could be small if building energy emissions are only a fraction of the project total.

Figure 3-2 illustrates the factsheet layout and annotates key content.

B3 Attach #1 of 3

Figure 3-2. Annotated Outline of the Measure Factsheet

Following each measure's factsheet is the measure's quantification method. Accurate and reliable quantification of GHG reduction measures depends on properly identifying and understanding the important variables that affect the emissions from a source or activity. A consistent framework and presentation are used for all measure quantification methods to provide a clear summary of quantification variables and usable instructions on appropriate application of the method.

The quantification methodology for each measure is comprised of the mathematical formula(s), summary of all variables used in the formula, explanation of any calculation caps or maximums, an example calculation, and information on quantified co-benefits. The variables in the GHG reduction formula(s) are shown as letters (e.g., A, B) and are defined in the table that immediately follows the equation. The table categorizes variables as outputs, user inputs, or constants, assumptions, and defaults. Bolded variables are required user inputs (i.e., variables for which no defaults are available).

Only those measures with literature to defensibly support emissions quantification are discussed in this Handbook. Examples of credible sources consulted for this Handbook include government agency-sponsored studies, peer-reviewed scientific literature, case studies, government-approved modeling software, and widely adopted protocols. Additional measures for user consideration are presented in *Supporting or Non-Quantified GHG Reduction Measures*. Methods for quantifying these measures have not yet been developed, are not fully supported by available research, or require specific details that are difficult to address under a methodology with general applicability. Users are encouraged to consider including these non-quantified measures into their projects, as described further below.

The measure factsheets and quantification methods follow *Supporting or Non-Quantified GHG Reduction Measures*. As discussed above, measures are grouped into nine emission sectors. Information relevant to the general quantification of all measures within a sector is presented at the introduction of each sector. Users may manually scroll through the factsheets in this chapter or use Figure 3-1 (above) to automatically navigate to a specific measure's factsheet.

Supporting or Non-Quantified GHG Reduction Measures

As a supplement to the GHG reduction measures shown in the factsheets, there are supporting or non-quantified measures that may be of interest to users. Although not quantitatively evaluated in the Handbook, supporting or non-quantified measures may achieve emissions reductions and co-benefits on their own or may enhance the ability of quantified measures to attain expanded reductions and co-benefits. These measures may, therefore, strengthen implementation of a project mitigation strategy or community plan.

Beyond their potential to expand the efficacy of a reduction plan, supporting or non-quantified measures provide users with more options to develop a comprehensive set of

B3 Attach #1 of 3

mitigation strategies. For example, this section can be used as a resource for expanded CEQA mitigation to identify additional measures that may be feasible and applicable to a specific project. Local governments developing a climate action plan or update to their general plan may also find this section useful as inspiration for new or more comprehensive policies. Many of the measures will achieve co-benefits (e.g., water conservation), in addition to GHG reductions, and may therefore be impactful throughout several elements of a local general plan (e.g., air quality, conservation, environmental justice).

While benefits of supporting or non-quantified measures may not be quantitively captured (or fully captured), the measures can be implemented using many of the same mechanisms as for quantified measures. When identified in a CEQA document, measures can be incorporated into a project's mitigation monitoring and reporting program to ensure that they are implemented and enforced. Cities and counties can update their municipal codes to require measures or certain measure components, which would ensure that the measures are implemented through new development or renovations in existing development. Measures can also be included as a set of best management practices that a local government or project sponsor encourages or incentivizes.

Table 3-1 presents the list of supporting or non-quantified GHG reduction measures. Note that these measures are numbered sequentially to follow the quantified measures within each sector (refer to the measure factsheets at the conclusion of this section). The table defines the measure's sector, scale of application, locational context, and likely co-benefits. For simplicity, these measure "descriptors" have been abbreviated in Table 3-1 as follows.

- Shaded rows identify the sector and subsector (in parentheses, where applicable) for each group of measures. For example, "Transportation (Land Use)."
- The scale of application is abbreviated as one of the following:
  - P/S = Project/Site
  - P/C = Plan/Community
  - All = Project/Site and Plan/Community
- For transportation measures, abbreviations for locational context refer to the level of development at the census tract level. The three locational contexts identified in the Handbook are suburban (S), urban (U), and rural (R). Most transportation measures are applicable to development within at least one of these three locational context areas.

  The three locational contexts were developed from the eight neighborhood types described in *Quantifying the Effect of Local Government Actions on VMT* (Salon 2014), as summarized below.
  - S = suburb with multifamily housing; suburb with single-family homes

LOCATIONAL CONTEXT

The following neighborhoods are provided as representative examples for the three locational context areas.

Suburban — Malibu, Davis, Santee

Urban — Central Berkeley, Downtown Los Angeles, Downtown San Jose

Rural — Coronado, Mather, most of Alpine County

B3 Attach #1 of 3

  - U = urban low transit; central city urban; urban high transit
  - R = rural; rural-in-urban
- Remaining columns identify co-benefits that may be achieved by the measure where:
  - ●= may be achieved by the measure
  - ⊙= may be achieved by the measure depending on local implementation specifics
  - ○= likely not achieved by the measure

Table 3-2 includes a more detailed description of each non-quantified measure, including equity considerations that lead agencies and project sponsors should review to ensure that measure implementation is as equitable as possible. Users should also refer to Chapter 4, *Assessing Climate Exposures and Measures to Reduce Vulnerabilities*, and Chapter 5, *Measures for Advancing Health and Equity*, for additional context on adaptation and equity that is also relevant to the supporting or non-quantified measures.

Finally, note that the inclusion of a measure in this section does not preclude it from quantification or indicate that it is impossible to quantify the benefits of the measure. If a user has access to specific data or methods, or if quantification guidance becomes available in the future, then users can quantitatively evaluate measures in those circumstances, if desired.

Table 3-1. Summary of Supporting or Non-Quantified GHG Reduction Measures and Descriptors

#	Measure Title	Scale of Application	Locational Context	Co-Benefits: Improved Air Quality	Energy and Fuel Savings	VMT Reductions	Water Conservation	Enhanced Pedestrian or Traffic Safety	Improved Public Health	Improved Ecosystem Health	Enhanced Energy Security	Enhanced Food Security	Social Equity

Sector abbreviations: T = transportation; E = energy; W = water; LL = lawn and landscaping; S = solid waste; N = natural and working lands; C = construction; M = miscellaneous.

Scale of application column abbreviations: P/S = Project/Site; P/C = Plan/Community; All.

Locational context column abbreviations: — = non-applicable; R = rural; S = suburban; U = urban. Where applicable, the Handbook provides three land use distinctions within the R locational context category, where R [a] = rural only if the project is in master-planned community; R [b] = rural only if the project is adjacent to commuter a rail station with convenient rail service to a major employment center; R [c] = rural only if there is available transit and the project is close to jobs/services.

Co-benefits columns symbols: ● = may be achieved by the measure; ⊙ = may be achieved by the measure depending on local implementation specifics; ○ = likely not achieved by the measure.

B3 Attach #1 of 3

Table 3-2. Description of Supporting or Non-Quantified GHG Reduction Measures

Transportation (Land Use)

T-31-A. Locate Project in Area with High Destination Accessibility

The measure requires development in an area with high accessibility to destinations. Destination accessibility is measured in terms of the number of jobs or other attractions (e.g., schools, supermarkets, and health care services) that are reachable within a given travel time or travel distance, and tends to be highest at central locations and lowest at peripheral ones. When destinations are nearby, the travel time between them is less, thus increasing the potential for people to walk and bike to those destinations and, therefore, reducing the vehicle miles traveled (VMT) and associated greenhouse gas (GHG) emissions. As an implementation consideration, projects should consider accessibility by people of all functional abilities and incorporate design principles such as Universal Design.[4] See Measure T-31-B for a variation of this measure.

T-31-B. Improve Destination Accessibility in Underserved Areas

This measure accounts for the VMT reduction that would be achieved by constructing job centers or other attractions (e.g., schools, supermarkets, and health care services) for residents in underserved areas (e.g., food deserts). When destinations are nearby, the travel time between them is less, thus increasing the potential for people to walk and bike to those destinations, reducing VMT and associated GHG emissions. As an implementation consideration, projects should consider accessibility by people of all functional abilities and incorporate design principles such as Universal Design. See Measure T-31-A for a variation of this measure.

T-32. Orient Project Toward Transit, Bicycle, or Pedestrian Facility

This measure requires projects to minimize setback distance between the project and planned or existing transit, bicycle, or pedestrian corridors. A project that is designed around an existing or planned transit, bicycle, or pedestrian corridor encourages sustainable mode use. As an implementation consideration, projects should consider accessibility by people of all functional abilities and incorporate design principles such as Universal Design.

T-33. Locate Project near Bike Path/Bike Lane

This measure requires projects to be located within 0.5-mile bicycling distance to an existing Class I or IV path or Class II bike lane. A project that is designed around an existing or planned bicycle facility encourages sustainable mode use. The project design should include a comparable network that connects the project uses to the existing off-site facilities that connect to work/retail destinations. As an implementation consideration, projects should provide sufficient and convenient bicycle parking and long-term storage, ideally near the bike lane itself, for residents, employees, and visitors, and a bicycle repair station with tools and equipment. This measure can be implemented with Measure T-9.

Transportation (Neighborhood Design)

T-34. Provide Bike Parking

This measure requires projects provide short-term and long-term bicycle parking facilities to meet peak season maximum demand. Parking can be provided in designated areas or added within rights-of-way, including by replacing parking spaces with bike parking corrals. Ensure that bike parking can be accessed by all, not just project employees or residents.

[4] Universal Design is a concept that is comprised of seven principles that seek to make buildings and infrastructure accessible to all people. Accessibility is achieved by considering and implementing each principle during the design process. A project designed by Universal Design standards would ensure that adjacent transit facilities are accessible to people with diverse abilities, preferences, and language skills.

T-35. Provide Traffic Calming Measures

This measure requires projects to include pedestrian/bicycle safety and traffic calming measures above jurisdictional requirements. Roadways should also be designed to reduce motor vehicle speeds and encourage pedestrian and bicycle trips with traffic calming features. Traffic calming features may include marked crosswalks, count-down signal timers, curb extensions, speed tables, raised crosswalks, raised intersections, median islands, tight corner radii, roundabouts or mini-circles, on-street parking, planter strips with street trees, chicanes/chokers, and others. Providing traffic calming measures encourages people to walk or bike instead of using a vehicle. This mode shift will result in a decrease in vehicle miles traveled. In 2017, 3,904 people were killed and 277,160 injured by vehicle collisions in California; traffic calming can reduce injuries and death, which improves health (State of California et al., 2018). Traffic calming also promotes active transportation, which improves physical health.

T-36. Create Urban Non-Motorized Zones

The measure requires projects to convert a percentage of its roadway miles to transit malls, linear parks, or other non-motorized zones. These features encourage non-motorized travel and thus a reduction in vehicle miles traveled. This measure is only applicable to projects located in urban environments. Consider access issues for paratransit users and those with mobility impairments.

T-37. Dedicate Land for Bike Trails

This measure requires projects to provide for, contribute to, or dedicate land for the provision of off-site bicycle trails linking the project to designated bicycle commuting routes in accordance with an adopted citywide or countywide bikeway plan. Existing desire paths can make good locations, as it represents a community-identified transportation need.

Transportation (Trip Reduction Programs)

T-38. Provide First and Last Mile TNC Incentives

This measure requires a first-last mile partnership between a municipality/transit agency and a transportation network company (TNC) for subsidized, shared TNC rides to or from the local transit station within a specific geographic area. This measure encourages a shift to transit mode for longer trips. Consider providing inclusive mechanisms so people without bank accounts, credit cards, or smart phones can access the incentives.

T-39. Implement Preferential Parking Permit Program

This measure requires projects provide preferential parking in terms of free or reduced parking fees, priority parking, or reserved parking in convenient locations (such as near public transportation or building entrances) for commuters who carpool, vanpool, ride-share or use sustainably fueled vehicles. Projects should also provide wide parking spaces to accommodate vanpool vehicles. Commercial preferential parking can accommodate workers who work non-standard hours by providing opportunities to participate. Residential preferential parking can consider an equitable distribution of permits, giving priority to owners of sustainably fueled vehicles.

T-40. Implement School Bus Program

This measure will provide school bus service transporting students to a school project. A school bus service can reduce the number of private vehicle trips to drop-off or pick-up students, thereby reducing VMT and associated GHG emissions, as well as onsite air pollution emissions, especially if the bus is zero emissions. Best practices include concentrating service for students who live further away from schools, providing service both before and after school, and encouraging parents to utilize the service. This measure is more effective at schools that draw students from a larger enrollment area, such as high schools or private schools.

B3 Attach #1 of 3

T-41. Implement a School Pool Program

This measure requires projects create a ridesharing program for school children. Most school districts provide bussing services to public schools only. School pool helps match parents to transport students to private schools, or to schools where students cannot walk or bike but do not meet the requirements for bussing. A school pool program can help reduce onsite air pollutant emissions at the school by reducing private vehicle trips, especially if the pool vehicle is zero emissions.

T-42. Implement Telecommute and/or Alternative Work Schedule Program

This measure requires projects to permit employee telecommuting and/or alternative work schedules and monitor employee involvement to ensure forecasted participation matches observed participation. While this measure certainly reduces commute-related VMT, recent research has shown that total VMT from telecommuters can exceed VMT from non-telecommuters (Goulias et al. 2020). In addition, telecommuting affects commercial and residential electricity use, complicating the calculation of the net effect and attribution of emissions. More specifically, an office with fewer employees could result in a decrease in the project's energy used to operate equipment and provide space heating and air conditioning. Conversely, an increase in telecommuters using their private homes as workspaces could result in a residential increase in energy for those same end uses and appliances. While this measure is currently not quantified and, according to some studies, could result in total VMT increases and other disbenefits, it is recommended that users review the most recent literature at the time of their project initiation to see if new findings more conclusively support a quantifiable emissions reduction.

Transportation (Transit)

T-43. Provide Real-Time Transit Information

This measure requires projects provide real-time bus/train/ferry arrival time, travel time, alternative routings, or other transit information via electronic message signs, dedicated monitor or interactive electronic displays, websites, or mobile apps. This makes transit service more convenient and may result in a mode shift from auto to transit, which reduces VMT.

T-44. Provide Shuttles (Gas or Electric)

This measure will provide local shuttle service through coordination with the local transit operator or private contractor. The shuttles will provide service to and from commercial centers to nearby transit centers to help with first and last mile connectivity, thereby incentivizing a shift from private vehicles to transit, reducing associated GHG emissions. Electric shuttle vehicles provide a marginally more effective reduction to GHG emissions compared to gas- or diesel-fueled shuttles due to their use of less emissions-intensive electric power. Shuttles that serve only the project residents and/or employees may be seen as increasing gentrification and exclusionary. Consider allowing all people to use the shuttle, regardless of status. Note that this measure can also be implemented at the Project/Site scale by a large employer as part of a Trip Reduction Program.

T-45. Provide On-Demand Microtransit

This measure will provide small-scale, on-demand public transit services that can offer fixed routes and schedules or flexible routes and on-demand scheduling (e.g., Metro Micro) through coordination with the local transit operator or private contractor. Microtransit aims to offer shorter wait times and improved reliability compared to the bus and rail system to further incentivize alternative transportation modes that are less emissions-intensive than private vehicle trips. On-demand rides can be booked using smartphone applications or call centers. Note that this measure may also be applicable at the Project/Site scale for a large employer (e.g., Google's Via2G pilot) as part of a Trip Reduction Program.

T-46. Improve Transit Access, Safety, and Comfort

This measure requires projects improve transit access and safety through sidewalk/crosswalk safety enhancements, bus shelter improvements, improved lighting, and other features. Work with the community to determine barriers to use, most desired improvements, and other access challenges.

T-47. Provide Bike Parking Near Transit

This measure requires the project to provide short-term and long-term bicycle parking near rail stations, transit stops, and freeway access points where there are commuter or rapid bus lines. Include locations for shared micromobility devices as well as higher-security parking for personal bicycles.

Transportation (Parking or Road Pricing/Management)

T-48. Implement Area or Cordon Pricing

This measure requires projects implement a cordon pricing scheme. The pricing scheme will set a cordon (boundary) around a specified area to charge a toll to enter the area by vehicle. The cordon location is usually the boundary of a central business district or urban center but could also apply to substantial development projects with limited points of access. The toll price can be based on a fixed schedule or be dynamic, responding to real-time congestion levels. It is critical to have an existing, high quality transit infrastructure for the implementation of this strategy to reach a significant level of effectiveness. The pricing signals will only cause mode shifts if alternative modes of travel are available and reliable. This measure should provide an exception for low-income residents or workers within the pricing zone.

T-49. Replace Traffic Controls with Roundabout

This measure requires projects install a roundabout as a traffic control device to smooth traffic flow, reduce idling, eliminate bottlenecks, and manage speed. In some cases, roundabouts can improve traffic flow and reduce emissions. The emission reduction depends heavily on what the roundabout is compared to (e.g., uncontrolled intersection, stop sign, traffic signal). Design roundabout so cyclists have the option to join traffic or bypass the roundabout with an adjacent path.

T-50. Required Project Contributions to Transportation Infrastructure Improvement

This measure requires projects contribute to traffic-flow improvements or other multi-modal infrastructure projects that reduce emissions and are not considered as substantially growth inducing. The local transportation agency should be consulted for specific needs. Larger projects may be required to contribute a proportionate share to the development and/or continuation of a regional transit system. Contributions may consist of dedicated right-of-way, capital improvements, or easements. Ensure the jurisdictional fee system does not disadvantage infill projects over greenfield projects.

T-51. Install Park-and-Ride Lots

This measure requires projects install park-and-ride lots near transit stops and high occupancy vehicle lanes. Park-and-ride lots also facilitate car- and vanpooling. Parking lots can also incorporate cool pavements, tree canopy, or solar photovoltaic shade canopies to reduce the urban heat island effect as well as evaporative emissions from parked vehicles and dedicated electric vehicle parking spots and/or charging infrastructure.

B3 Attach #1 of 3

T-52. Designate Zero Emissions Delivery Zones

This measure requires the municipality to designate certain curbside locations as commercial loading zones exclusively available for zero-emission commercial delivery vehicles. Doing so replaces tailpipe diesel emissions from last-mile delivery vehicles as well as heavy duty drayage trucks moving goods with less emissions-intensive electric vehicles and potentially micromobility for food and parcel delivery. Locations should be prioritized based on land use density and existing exposure from air pollution.

Transportation (Clean Vehicles and Fuels)

T-53. Electrify Loading Docks

This measure will require that Transport Refrigeration Units and auxiliary power units (APUs) be plugged into the electric grid at the loading dock instead of running on diesel. The indirect GHG emission from electricity generation can partially offset the emissions reduction from fuel reductions. Electrifying loading docks can reduce exposure to air pollutants for workers and drivers.

T-54. Install Hydrogen Fueling Infrastructure

The measure requires projects to implement accessible hydrogen fuel cell fueling infrastructure. Drivers of fuel cell electric vehicles (FCEV), from individual passenger vehicles to haul truck fleets, will be able to refuel using this infrastructure. The expansion of hydrogen fueling locations indirectly supports the uptake of FCEV in place of the typical internal combustion engine vehicle fueled by carbon-emitting gasoline and diesel.

Energy (Energy Efficiency)

E-20. Install Whole-House Fans

This measure requires installation of whole-house fans. Whole-house fans draw cooler outdoor air through open windows, exhaust the warmer air into the attic, and then expel the air outside through attic vents. Whole-house cooling using a whole house fan can substitute for an air conditioner most of the year in most climates, resulting in a reduction in emissions associated with building energy use. Whole-house fans may be inappropriate in locations near sources that generate air pollutants during the evening hours, such as major roads and freeways.

E-21. Install Cool Pavements

This measure will install cool pavements in place of dark pavements. Cool pavements help to lower ambient outdoor air temperatures when compared to dark-colored, heat-absorbent pavements such as asphalt. This reduces the electricity needed to provide cooling, but in some climates, can also increase the energy emissions to provide heating, thereby reducing associated GHG emissions depending on the project parameters (e.g., climate, carbon intensity of local utility). Prioritize cool pavement installation in neighborhoods with high urban heat island effects, large amounts of paved areas, low tree canopy, or high vulnerability due to age, employment, income, linguistic isolation, and other indicators.

E-22. Obtain Third-party HVAC Commissioning and Verification of Energy Savings

This measure requires third-party review of heating ventilation and air conditioning (HVAC) systems to ensure proper installation and construction of energy reduction features. A user can obtain HVAC commissioning and third-party verification of energy savings in thermal efficiency components including HVAC systems, insulation, windows, and water heating. Note that the 2019 Title 24 Standards requires Home Energy Rating System (HERS) verification for all new low-rise residential building (3 stories or less). Taller residential buildings and non-residential buildings may or may or not require a HERS verification depending on other buildings elements.

Energy (Renewable Energy Generation)

E-23. Use Microgrids and Energy Storage

This measure requires management of a microgrid. Microgrids offer the opportunity to deploy more zero-emission electricity sources, thereby reducing GHG emissions. The microgrid manager (e.g., local energy management system) can balance generation from non-controllable renewable power sources, such as solar, with distributed, controllable generation, such as natural gas-fueled combustion turbines. They can also use energy storage and the batteries in electric vehicles to balance energy distribution and usage within the microgrid. Reliable electricity is vital for public health, especially vulnerable populations and people dependent on medical equipment.

E-24. Provide Battery Storage

This measure requires strategically deployed battery storage. Energy storage has no direct emissions effect. When deployed strategically, energy storage can make the grid more flexible, unlocking renewable energy and reducing GHG emissions. When deployed non-strategically, owners of energy storage assets are more likely to charge their facilities during off-peak periods when power prices are lower, in order to supply power during more expensive peak hours. Off-peak generation times such as nighttime hours are more likely to be dominated by conventional power sources, which, with the exception of nuclear and hydropower, are likely to be more emissions-intensive (Bistline and Young 2020). In California, the value of energy storage stems primarily from its ability to reduce renewable curtailment, thereby displacing fossil-fueled generation (Arbabzadeh et al. 2019). While this measure is currently not quantified and, according to some studies, could result in regional GHG and criteria pollutant emissions increases, it is recommended that users (1) review the most recent literature at the time of their project initiation and (2) evaluate any changes in policy or market for renewable energy to see if new findings more conclusively support a quantifiable emissions reduction.

Energy (Building Decarbonization)

E-25. Install Electric Heat Pumps

This measure requires installation of electric heat pumps as alternatives to conventional furnaces or air conditioners. Electric heat pumps use electricity to transfer heat between cool and warm spaces to either provide cooling or heating. When cooling is needed during the summer months, the pumps move warmer inside air to outside. The pumps operate in reverse during the winter, moving warmer outdoor air into the building to provide heat. Because heat pumps move warm air instead of generating heat, they are more efficient than conventional heating and cooling systems. When electric heat pumps replace fossil-fuel heating or cooling sources, they achieve a dual efficiency and decarbonization benefit. The most common types of heat pumps collect heat from the air (are air-to-air), water (water-to-air), or ground (geothermal-to-air). The performance and emissions reductions achieved by electric heat pumps depend heavily on the system type, cooling and heating loads, climate zone, season, and other project-specific variables.

B3 Attach #1 of 3

Lawn and Landscaping

LL-2. Implement Yard Equipment Exchange Program

This measure requires the project to participate in an established yard equipment exchange program, supplement an established program, or implement a new program. When conventional gasoline-powered yard equipment (e.g., lawn mowers, leaf blowers and vacuums, shredders, trimmers, and chain saw) are exchanged for electric and rechargeable battery-powered yard equipment, direct GHG emissions from fossil-fuel combustion are displaced by indirect GHG emissions associated with the generation of electricity used to power the equipment. Commercial users of yard equipment should be targeted for this measure given their comparatively low adoption rate of electric yard equipment relative to residential users. If the specific equipment being replaced through the program is known, reductions may be quantified using the method described under Measure LL-1.

LL-3. Electric Yard Equipment Compatibility

This measure requires projects provide electrical outlets on the exterior of buildings as necessary for sufficient powering of electric lawnmowers and other landscaping equipment. For Measures LL-1 and LL-2 to be successfully implemented, electrical outlets on the exterior of buildings must be accessible so that the electric landscaping equipment can be charged.

Solid Waste

S-3. Require Edible Food Recovery Program Partnerships with Food Generators

This measure requires food service, wholesale, and retail sources of edible food partner with food recovery programs. Food recovery programs collect edible foods from commercial production and distribution channels that would otherwise be transported to a landfill and redistribute them for consumption. This measure would avoid emissions from the decomposition of non-diverted organic material in landfills.

S-4. Recycle Demolished Construction Material

This measure requires recycling of construction waste. Recycling demolished construction material reduces GHGs by displacing new construction materials, thereby reducing the need for new raw material acquisition and manufacturing. If the process of recycling construction materials is less carbon-intensive than the processes required to harvest and produce new construction materials, recycling results in a net reduction in GHG emissions. Using local recycled construction material would also reduce emissions associated with the transportation of new construction materials, which are typically manufactured farther away from a project site. Finally, recycling avoids sending materials to landfills. Wood-based materials decompose in landfills and contribute to methane (CH_4) emissions. Ensure onsite processing does not create nuisance issues for nearby residents.

S-5. Source Wood Materials from Urban Wood Re-Use Program

This measure requires projects to source wood materials from urban wood re-use programs. In areas where removed trees are sent to landfills, they decompose and contribute to CH_4 emissions. Wood re-use programs extend a tree's lifetime by converting it into a range of products and prolonging the sequestration benefit. Re-uses range from logs, lumber, woodchips, mulch, compost, biochar, animal fuel, paper products, engineered wood, furniture, and cellulosic ethanol.

B3 Attach #1 of 3

Natural and Working Lands

N-5. Establish a Local Farmer's Market

This measure would establish a local farmer's market to provide project residents with a more local source of food, potentially reducing the number of trips and VMT by both consumers and food distribution to grocery stores and supermarkets. If the food sold at the local farmer's market is produced organically, it can also contribute to GHG reductions by displacing carbon-intensive food production practices. Work with local non-profits or foundations to provide Electronic Benefit Transfer (EBT) acceptance at the market, which facilitates access for lower-income populations. The USDA offers resource and guidance for farmer's markets accepting EBT, while some foundations offer multiplier programs, in which $1 of EBT funds becomes a greater value if spent at a farmer's market.

N-6. Establish Community Gardens

This measure would establish a community garden to provide project residents with locally sourced food, potentially reducing the number of trips and VMT by both consumers and food distribution to grocery stores and supermarkets. Community gardens can also contribute to GHG reductions by displacing carbon-intensive food production practices. Work with community residents and community-based organizations to make sure the gardens are designed inclusively and are open to all residents.

Construction

C-4. Use Local and Sustainable Building Materials

This measure requires using building materials that are locally sourced and processed (i.e., close to the project site, as opposed to in another state or country). This reduces VMT and therefore GHG emissions from fuel combustion. Using sustainable building materials, such as recycled concrete or sustainably harvested wood, also reduces GHG emissions due to the less carbon-intensive production process. Unlike measures that reduce GHG emissions during the operational lifetime of a project, using local and sustainable building materials mitigates emissions prior to the actual operational lifetime of a project.

Miscellaneous

M-4. Require Environmentally Responsible Purchasing

This measure requires projects to implement an environmentally responsible purchasing plan. Examples of environmentally responsible purchases include but are not limited to: purchasing products made from recycled materials or with sustainable packaging; purchasing post-consumer recycled paper, paper towels, and stationery; purchasing and stocking communal kitchens with reusable dishes and utensils; choosing sustainable cleaning supplies; purchasing products from restaurants, farms, or ranches that source materials or goods from locations that use soil conservation practices; and leasing equipment from manufacturers who will recycle the components at their end of life. Choosing locally made and distributed products reduces the distance required to transport the products from the distribution or manufacturing center to the project, thus reducing GHG emissions associated with transportation.

B3 Attach #1 of 3

M-5. Fund Incentives for Green Technologies

This measure would fund incentives for green technologies. Examples of green technologies include energy-efficient and zero-emission vehicle fleets and off-road equipment, building electrification upgrades, low-flow fixtures in buildings, or energy-efficient stationary sources. The user may choose to contribute to an existing municipal energy fund or establish a new energy fund for the project. Recipients of energy fund grants could include neighborhood developers, home and commercial space builders, homeowners, and utilities. Energy funds allow recipients flexibility in choosing efficiency strategies while still achieving the desired effects of reduced energy use and associated GHG emissions. If coupled with local apprenticeship and job training, this measure can help provide workforce development in green jobs for the local community.

Transportation

Fossil-fuel powered vehicles are the primary source of GHG emissions within the transportation sector. On-road vehicles traditionally use gasoline and diesel fuel and release emissions based on the amount of fuel combusted and the emission factor of the engine. Cleaner-fueled and electric powered vehicles can also generate GHG emissions, but often at far lower intensities.

Transportation emissions can be reduced by improving the emissions profile of the vehicle fleet or by reducing VMT. Most of the measures quantified in this Handbook aim to reduce VMT and encourage mode shifts from single-occupancy vehicles to shared (e.g., transit) or active modes of transportation (e.g., bicycle). This can be accomplished by coordinating trip reduction or incentive programs; optimizing the land use of the project study area; enhancing road, bike and pedestrian networks; implementing parking policies; or improving transit systems.

WHAT'S ELASTICITY?

Elasticity refers to how much one variable changes, relative to a change in another variable. For example, the elasticity of a VMT reduction measure would measure how much VMT is reduced in proportion to the increase in bicycle lanes.

Most of the emission reductions are determined by evaluating the *elasticity* of a measure relative to the amount of VMT that may be reduced by the measure. A few transportation measures are aimed at improving the emissions profile of the vehicle fleet. These measures promote alternative fuels and vehicle types. The emission reductions from these measures are based on the improved emission factors and on changes to the assumed vehicle fleet mix.

This section provides guidance for combining emission reductions from transportation measures and adjusting VMT reductions to expected GHG savings. The measure factsheets and quantification methods for individual measures follow. Use the graphic on the following page to click on an individual measure to navigate directly to the measure's factsheet.

Selecting and Combining Transportation Measures

Depending on how VMT has been quantified for a project or program, users should exercise caution when selecting transportation measures to avoid double counting VMT benefits that may already be accounted for in the model used to produce the unmitigated or baseline VMT estimate. For example, regional travel demand models are generally sensitive to built environment and transit service variables (e.g., density, proximity to transit). VMT estimates developed for a project or program that use such models may, therefore, already account for VMT reductions associated with certain measures in this Handbook (e.g., T-1, *Increase Residential Density*).

Transportation

LAND USE

- T-1. Increase Residential Density
- T-2. Increase Job Density
- T-3. Provide Transit-Oriented Development
- T-4. Integrate Affordable and Below Market Rate Housing
- T-17. Improve Street Connectivity

TRIP REDUCTION PROGRAMS

- T-5. Implement Commute Trip Reduction Program (Voluntary)
- T-6. Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring)
- T-7. Implement Commute Trip Reduction Marketing
- T-8. Provide Ridesharing Program
- T-9. Implement Subsidized or Discounted Transit Program
- T-10. Provide End-of-Trip Bicycle Facilities
- T-11. Provide Employer-Sponsored Vanpool
- T-12. Price Workplace Parking
- T-13. Implement Employee Parking Cash-Out
- T-23. Provide Community-Based Travel Planning

PARKING OR ROAD PRICING/MANAGEMENT

- T-14. Provide Electric Vehicle Charging Infrastructure
- T-15. Limit Residential Parking Supply
- T-16. Unbundle Residential Parking Costs from Property Cost
- T-24. Implement Market Price Public Parking (On-Street)

NEIGHBORHOOD DESIGN

- T-18. Provide Pedestrian Network Improvement
- T-19-A. Construct or Improve Bike Facility
- T-19-B. Construct or Improve Bike Boulevard
- T-20. Expand Bikeway Network
- T-21-A. Implement Conventional Carshare Program
- T-21-B. Implement Electric Carshare Program
- T-22-A. Implement Pedal (Non-Electric) Bikeshare Program
- T-22-B. Implement Electric Bikeshare Program
- T-22-C. Implement Scootershare Program

TRANSIT

- T-25. Extend Transit Network Coverage or Hours
- T-26. Increase Transit Service Frequency
- T-27. Implement Transit-Supportive Roadway Treatments
- T-28. Provide Bus Rapid Transit
- T-29. Reduce Transit Fares

CLEAN VEHICLES AND FUELS

- T-30. Use Cleaner-Fuel Vehicles

Interactions between transportation measures are complex and sometimes counterintuitive, whereby combining measures can have a substantive impact on reported emission reductions. To safeguard the accuracy and reliability of the methods, while maintaining their ease of use, the following rules should be followed when combining reductions achieved by transportation measures.

Combining Measures Across Scales

The first level of organization for the transportation measures is the scale of application. There are 16 quantified measures at the Project/Site scale that can be combined with each other and 17 quantified measures at the Plan/Community scale that can be combined with each other.[4] *The GHG reductions of transportation measures from different scales of application should never be combined.* While it may be possible that a user's project involves measures that affect vehicle trips or VMT at both scales, it is likely that combining the percent reduction from measures of different scales would not be valid. This rule does not apply to non-transportation measures that calculate the emissions reduction in terms of absolute emissions.

[4] There is one additional quantified transportation measure: Measure T-30, *Use Cleaner-Fuel Vehicles*. All below discussion related to combining measures and determining maximums does not apply to this measure, which is part of the Clean Vehicles and Fuels subsector.

Combining Measures within a Subsector

The second level of organization for the transportations measures is the subsector. Transportation measures are separated into six subsectors: Land Use, Neighborhood Design, Trip Reduction Programs, Parking Management, Transit, Parking or Road Pricing/Management, and Clean Vehicles and Fuels.

Effectiveness levels for multiple measures within a subsector may be multiplied to determine a combined effectiveness level. Because the combination of measures and independence of measures are complicated, this Handbook recommends that measure reductions within a subsector be multiplied unless the user can provide substantial evidence indicating that emission reductions are independent of one another and that they should therefore be added. This will take the following form:

$$\text{Reduction}_{\text{subsector}} = 1 - [(1 - A) \times (1 - B) \times (1 - C)]$$

Where A, B, and C are the individual measure reduction percentages for the measures to be combined in each subsector.

Each measure has a maximum allowable reduction, discussed in the quantification methods for each measure. The user should calculate the reduction from each measure, compare it to the individual measure maximum, and use the lower value of the two in the equation above.

In addition, each subsector has a maximum allowable reduction. These were derived by combining the maximum allowable reduction of each individual non–mutually-exclusive measure within the subsector using the above formula (see table below for more details). The subsector maximum is intended to ensure that emissions are not double counted when measures within the subsector are combined. The subsector maximums are provided in the below table by scale of application.

Scale	Subsector	Quantified Measures [a]	Subsector Maximum [b, c, d, e, f]
P/S	Land Use	4	65%
	Neighborhood Design	—	—
	Trip Reduction Programs	9	45% commute VMT
	Parking or Road Pricing/ Management	3	35%
	Transit	—	—
P/C	Land Use	1	30%
	Neighborhood Design	9	10%
	Trip Reduction Programs	1	2.3% commute VMT
	Parking or Road Pricing/ Management	1	30%
	Transit	5	15%

P/S = project/site; P/C = plan/community; VMT = vehicle miles traveled.

[a] Excludes Measure T-30, *Use Cleaner-Fuel Vehicles*, within the Clean Vehicles and Fuels subsector and all supporting or non-quantified measures from other subsectors.

[b] — = no measure within the subsector at the specified scale.

[c] Where a subsector consists of only one measure, the subsector maximum listed is the individual measure maximum.

[d] Most maximums were conservatively rounded down to the nearest multiple of five or whole number.

[e] Measure T-1 and Measure T-2 were assumed to be mutually exclusive for the purpose of deriving a project's single land use type maximum emissions reduction. More specifically, residential density (T-1) only applies to residential development, and job density only applies to commercial development (T-2). Similarly, Measure T-26 and Measure T-27 were assumed to be mutually exclusive with Measure T-28 for the purpose of deriving a plan/community's total transit-related emissions reduction. Measure T-28 accounts for the VMT reduction associated with increased transit frequency (T-26) and decreased transit travel time from transit supportive roadway treatments (T-27). It was assumed that bus rapid transit (BRT) (T-28) would cover all of the community's transit routes, and therefore no additional frequency or time improvements would be attainable (T-26 and T-27).
[f] Measures within the Trip Reduction Programs primarily reduce VMT from *employee commute* trips, whereas all other measures reduce VMT from *all* trips associated with the relevant land use type.

The user should calculate the reduction from each subsector, compare it to the corresponding sector maximum, and use the lower value of the two.

Combining Measures Across Subsectors

There is limited research directly analyzing the combined VMT impact on a project/site or plan/community from implementation of all, or a majority, of the non–mutually-exclusive transportation sector measures provided in this Handbook. However, a University of California, Davis study compared household VMT across different place types in California and found that the difference in average VMT in single-family suburban neighborhoods and central city neighborhoods was approximately 70 percent.[5] Central city neighborhoods are more likely to have implemented transportation strategies like those measures included in the Handbook, when compared to suburban neighborhoods. The Handbook therefore adopts 70 percent as a maximum for the combined VMT impact from the following four subsectors: Land Use, Neighborhood Design, Parking or Road Pricing/Management, and Transit.

$$\text{Reduction}_{\text{multi-subsector}} = 1 - [(1 - \text{Land}) \times (1 - \text{Design}) \times (1 - \text{Parking}) \times (1 - \text{Transit})] \leq 70\%$$

Note that this multi-subsector maximum purposefully excludes the Trip Reduction Program subsector. This is because measures in the Trip Reduction Program subsector are often implemented at the Project/Site scale based on the individual employer and are not as directly correlated with place type as the other subsectors. For example, all central city neighborhoods have a high residential and commercial density (i.e., Measure T-1 and Measure T-2 from the Land Use subsector), and most single-family suburban neighborhoods have low density. Conversely, not all employers in a central city neighborhood provide their employees with discounted transit passes (Measure T-9 from the Trip Reduction Program subsector), and the same is equally likely for the much smaller group of employers in a single-family suburban neighborhood.

Limitations of Maximums and Caps

The words *maximum* and *cap* are used interchangeably to describe either the highest percent reduction in GHG emissions or the highest expected value for a variable in the GHG reduction formula. Each subsector has a maximum allowable reduction and individual measures have a maximum allowable reduction, which is often based on one or more of the capped GHG reduction variables. In most instances, these values are a rule of thumb, or practical approximation, to limit the unrealistic influence of multiplicative measure variables. Where the

[5] Salon, D. 2014. *Quantifying the Effect of Local Government Actions on VMT.* Institute of Transportation Studies, University of California, Davis. Prepared for the California Air Resources Board and the California Environmental Protection Agency. February. Available: https://ww2.arb.ca.gov/sites/default/files/classic/research/apr/past/09-343.pdf. Accessed: October 2021.

maximum is derived based on a more precise methodology (e.g., research results), the source is cited. Users should always confirm the appropriateness of these maximums for their project.

Adjusting VMT Reductions to Emission Reductions

Most of the transportation measures in this Handbook reduce GHG emissions and criteria pollutants (co-benefit) by reducing the source metric of VMT.[6] The below equation highlights the main variables used to calculate VMT in a study area. Note that VMT decreases if any of the following occurs: (1) vehicle ownership declines, (2) vehicle trips are reduced, (3) vehicle trip lengths are reduced, or (4) any combination of these three variables.

$$\text{VMT} = \frac{\text{vehicles}}{\text{study area}} \times \frac{\text{trips}}{\text{vehicle}\cdot\text{day}} \times \frac{\text{distance (miles)}}{\text{trip}} = \frac{\text{miles}}{\text{study area}\cdot\text{day}}$$

Vehicles emit pollutants during all hours of the day. The magnitude of these emissions varies with the activity phase, such as running on the road, idling while stationary, sitting outside in the sun (evaporative), or starting up. The quantification methods presented in this Handbook account for emissions that occur during the three major emission processes of running, evaporation, and starting.[7]

Emissions generated by these processes are determined, in part,[8] by the above VMT variables: (1) emissions from evaporation are a factor of vehicle ownership, (2) emissions from starting are a factor of vehicle ownership and number of vehicle starts (i.e., trips), and (3) emissions from running are a factor of vehicle ownership and number of vehicle trips and distance per trip (i.e., VMT).

$$\text{Emissions}_{\text{total}} = \text{Emissions}_{\text{evap}} + \text{Emissions}_{\text{start}} + \text{Emissions}_{\text{run}}$$

$$\text{Emissions}_{\text{evap}} = \frac{\text{vehicles}}{\text{study area}} \times \frac{\text{pollutant mass (grams)}}{\text{vehicle}\cdot\text{day}} = \frac{\text{grams}}{\text{study area}\cdot\text{day}}$$

$$\text{Emissions}_{\text{start}} = \frac{\text{vehicles}}{\text{study area}} \times \frac{\text{trips}}{\text{vehicle}\cdot\text{day}} \times \frac{\text{pollutant mass (grams)}}{\text{trip}\cdot\text{day}} = \frac{\text{grams}}{\text{study area}\cdot\text{day}}$$

$$\text{Emissions}_{\text{run}} = \frac{\text{vehicles}}{\text{study area}} \times \frac{\text{trips}}{\text{vehicle}\cdot\text{day}} \times \frac{\text{miles}}{\text{trip}} \times \frac{\text{pollutant mass (grams)}}{\text{distance (miles)}} = \frac{\text{grams}}{\text{study area}\cdot\text{day}}$$

GHG and criteria pollutant reductions achieved by transportation measures are primarily presented in terms of a percent reduction, where the total emissions reduction was determined based on a ratio comparison to the VMT reduction. In other words, if a measure reduces VMT by some percent, the total emissions are reduced by the same percent (or a fraction of that percent, as described below). As discussed above, VMT can be reduced by decreasing any of the three variables of vehicle ownership, number of vehicle trips, and trip distance. The ratio comparison between reductions in VMT and emissions depends on the pollutant and which VMT variable(s) decrease with implementation of a transportation measure.

[6] Exceptions include Measures T-14, *Provide Electric Charging Infrastructure*, and T-30, *Use Cleaner-Fuel Vehicles*.

[7] A fourth emission process is idling. EMFAC estimates idle exhaust emissions only for heavy-duty vehicles that idle for extended periods of time while loading or unloading goods. This document analyzes emissions primarily from passenger vehicles and thus focuses on the three relevant emission processes of evaporation, starting, and running.

[8] Vehicle emissions are also a function of the chosen analysis year, project location, and fleet mix. When using EMFAC, future year emissions decline over time, reflecting assumed changes in fleet mix for the location and cleaner engine and fuel technologies.

1. *Less vehicle ownership*. If a transportation measure reduces VMT by decreasing vehicle ownership, the measure would decrease running, starting, and evaporative emissions by the same rate.[9] The measures where this applies are Measures T-15, *Limit Residential Parking Supply*, and T-16, *Unbundle Residential Parking Costs from Property Cost*, where the VMT reduction is a function of avoided vehicle ownership in residents disincentivized to park offsite or pay the separate cost of parking for a vehicle. For these measures, there is a 1:1 relationship between reductions in VMT and emissions because these measures reduce all emission processes at the same rate, not just running emissions.

2. *Fewer vehicle trips*. If a transportation measure reduces VMT by decreasing the number of vehicle trips, the measure would decrease running emissions and starting emissions by approximately the same rate. This applies to all transportation measures except Measures T-14, *Provide Electric Vehicle Charging Infrastructure;* T-15, *Limit Residential Parking Supply;* T-16, *Unbundle Residential Parking Costs from Property Cost;* and T-30, *Use Cleaner-Fuel Vehicles*. This is because each measure would result in, at minimum,[10] fewer vehicle trips by promoting alternative modes of transportation in place of single-occupancy vehicles.

   These measures would not decrease evaporative emissions, which are a function of vehicle ownership. However, this does not affect the ratio comparison between reductions in VMT and GHG emissions because there are no evaporation GHG emissions (i.e., 100 percent of CO_2, CH_4, and nitrous oxide (N_2O) from vehicles are from running and starting). This is also true for nitrogen oxides (NOx) particulate matter (PM2.5 and PM10), carbon monoxide (CO), and sulfur dioxide (SOx). Therefore, for these measures and pollutants, there is a 1:1 relationship between reductions in VMT and emissions.

   Reactive organic gases (ROG) from vehicles include not only running and starting emissions, but also evaporative emissions.[11] Running and starting ROG emissions represent approximately 87 percent of total ROG emissions in passenger vehicles.[12] This adjustment factor should be applied when converting the percent GHG reduction to the percent reduction in total ROG emission.

   $$\% \text{ reduction in ROG emissions} = \% \text{ reduction in GHG} \times 87\%$$

   This is noted in the co-benefits section of *Improved Air Quality* for each applicable transportation measure.

3. *Shorter vehicle trips*. If a transportation measure reduces VMT by only decreasing the distance of vehicle trips, the measure would not reduce starting or evaporative emissions. There are no transportation measures in this Handbook where this scenario occurs and, therefore, an adjustment factor is not developed.

[9] Assuming emission factor variables are held constant.

[10] Many of these measures also result in shorter vehicle trips. In these instances, the VMT reduction is either largely a function of the reduction in vehicle trips or is an equal function of the reduction in vehicle trips and the reduction in trip distances. There are no measures where the VMT reduction is largely a function of the reduction in trip distances with a lesser contribution from the reduction in vehicle trips.

[11] See *EMFAC2017 User's Guide* for more detail on these emission processes. Available: https://ww3.arb.ca.gov/msei/downloads/emfac2017-volume-i-users-guide.pdf.

[12] Combined emissions from the EMFAC vehicle types of LDA, LDT1, and LDT2.

The criteria pollutants CO, NO_2, SO_2, and PM are local pollutants that can potentially affect populations near the emissions source. Accordingly, measures that reduce localized criteria pollutant emissions can improve ambient air quality. Measures that reduce emissions of ozone precursors (NOx and ROG), which are regional pollutants, can improve regional air quality.

Note that the Handbook's use of a ratio comparison of VMT reduction to GHG and criteria pollutant reductions makes two key assumptions that may not be valid for every user's project. It is important users consider the validity of these assumptions on a project-by-project basis and either (1) perform any post-processing to the emissions reductions achieved by the transportation measures to better reflect their project conditions, or (2) provide a qualitative disclaimer about the accuracy of the estimated reductions considering the below assumptions.

1. *Vehicle class is assumed to remain unchanged with implementation of a measure*. Say a user is interested in calculating the plan/community-level GHG reduction from Measure T-22-B, *Implement Electric Bikeshare Program*. The user has community-level VMT without the measure and elects to calculate community-wide mobile emissions using EMFAC. The user calculates in EMFAC that the existing percent of the community VMT by vehicle class is 75 percent light-duty vehicles and 25 percent non-light-duty vehicles. In this example, the average emission factor for light-duty vehicles is 250 grams CO_2 per mile and for non–light-duty vehicles is 400 grams CO_2 per mile. The average community emission factor, as weighted by VMT, would be 288 grams per mile [(75% X 250 grams CO_2 per mile) + (25% X 400 grams CO_2 per mile)]. Users then estimate vehicle emissions prior to implementation of Measure T-22-B by applying this average vehicle emission factor to their community-level VMT.

   The user then implements Measure T-22-A, *Implement Pedal (Non-Electric) Bikeshare Program*, and reduces GHG emissions from vehicle travel by 4 percent by replacing vehicle trips with bikeshare trips. The majority of those replaced vehicle trips are private trips as light-duty vehicles. As a result, the percent of the community VMT by vehicle class is now 70 percent light-duty vehicles and 30 percent non–light-duty vehicles, effectively increasing the community average vehicle emission factor, as weighted by VMT, from 288 grams per mile to 295 grams per mile [70% X 250 grams CO_2 per mile) + (30% X 400 grams CO_2 per mile)]. This increase in the community average vehicle emission factor lessens the GHG reduction that would be achieved from reduced vehicle trips.

   Conversely, the circumstances could be such that a measure increases the GHG reduction that would be achieved from reduced vehicle trips. For example, Measure T-22-A may replace existing vehicle trips that are primarily from more emissions-intensive non–light-duty vehicles (e.g., transit buses). In this case, the percent of the community VMT by the less–emissions-intensive light-duty vehicle would be higher, reducing the community average vehicle emission factor. This decrease in the community average vehicle emission factor would increase the GHG reduction that would be achieved from reduced vehicle trips.

   The Handbook method cannot predict or know how each measure could affect the user's specific fleet mix. Therefore, the fleet mix is assumed to remain constant before and after implementation of all transportation measures.

2. *Vehicle speeds are assumed to remain unchanged with implementation of a measure*. The logic of this assumption is similar to the first assumption. Say a user is interested in calculating the plan/community-level GHG reduction from Measure T-20, *Expand Bikeway Network*. The user elects to calculate community-wide mobile emissions prior to implementation of the measures using EMFAC and aggregated vehicle speeds. In this example, EMFAC aggregates the vehicle speeds in the user's community at approximately 30 miles per hour (mph).[13] The user implements Measure T-20 and expansion of the bikeway network reduces the average vehicle speed to approximately 25 mph. Because vehicles are slightly more GHG emissions-intensive at 25 mph compared to 30 mph, the GHG reduction achieved by the measure would be less if the impact of vehicle speeds were included in the quantification method.

   Conversely, the circumstances could be such that a measure increases the GHG reduction that would be achieved from reduced vehicle trips. For example, Measure T-11, *Provide Employer-Sponsored Vanpool*, replaces private vehicle trips with shared vanpool trips, reducing the number of cars on the road. If roadways are currently congested and causing vehicles to move at low speeds, implementation of this measure could alleviate roadway congestion and increase vehicle speeds to a speed in which they are less GHG emissions intensive. The decrease in the community average vehicle emission factor would increase the GHG reduction that would be achieved from reduced vehicle trips.

   The Handbook method cannot predict or know how each measure could affect vehicle speeds under the various use cases. Therefore, the vehicle speeds are assumed to remain constant before and after implementation of all transportation measures.

Use of Transportation Quantification Methodologies for Senate Bill 375 Compliance

As described in Appendix B, *Federal and State Planning Framework,* Senate Bill (SB) 375 requires metropolitan planning organizations (MPOs) to incorporate a SCS in their regional transportation plans (RTPs) and submit it to the California Air Resources Board (CARB) for review. The goal of the SCS is to reduce regional passenger vehicle VMT and associated GHG emissions through land use and transportation planning. CARB requires MPOs quantify the passenger vehicle VMT reductions achieved by their SCSs using a specific method. It is therefore not recommended that MPOs use the transportation measure quantification methodologies found in this Handbook when preparing their SCSs.

[13] Vehicle running emission factors are, in part, dependent on vehicle speed. Vehicles are generally more emissions-intensive at speeds that are very low (e.g., 5 mph) and very high (e.g., greater than 70 mph), though this varies by pollutant and vehicle class.

T-1. Increase Residential Density

GHG Mitigation Potential

Up to 30.0% of GHG emissions from project VMT in the study area

Co-Benefits (icon key on pg. 34)

Climate Resilience

Increased density can put people closer to resources they may need to access during an extreme weather event. Increased density can also shorten commutes, decreasing the amount of time people are on the road and exposed to hazards such as extreme heat or flooding.

Health and Equity Considerations

Neighborhoods should include different types of housing to support a variety of household sizes, age ranges, and incomes.

Measure Description

This measure accounts for the VMT reduction achieved by a project that is designed with a higher density of dwelling units (du) compared to the average residential density in the U.S. Increased densities affect the distance people travel and provide greater options for the mode of travel they choose. Increasing residential density results in shorter and fewer trips by single-occupancy vehicles and thus a reduction in GHG emissions. This measure is best quantified when applied to larger developments and developments where the density is somewhat similar to the surrounding area due to the underlying research being founded in data from the neighborhood level.

Subsector

Land Use

Locational Context

Urban, suburban

Scale of Application

Project/Site

Implementation Requirements

This measure is most accurately quantified when applied to larger developments and/or developments where the density is somewhat similar to the surrounding neighborhood.

Cost Considerations

Depending on the location, increasing residential density may increase housing and development costs. However, the costs of providing public services, such as health care, education, policing, and transit, are generally lower in more dense areas where things are closer together. Infrastructure that provides drinking water and electricity also operates more efficiently when the service and transmission area is reduced. Local governments may provide approval streamlining benefits or financial incentives for infill and high-density residential projects.

Expanded Mitigation Options

When paired with Measure T-2, *Increase Job Density*, the cumulative densification from these measures can result in a highly walkable and bikeable area, yielding increased co-benefits in VMT reductions, improved public health, and social equity.

GHG Reduction Formula

$$A = \frac{B - C}{C} \times D$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from project VMT in study area	0–30.0	%	calculated
User Inputs				
B	Residential density of project development	[ ]	du/acre	user input
Constants, Assumptions, and Available Defaults				
C	Residential density of typical development	9.1	du/acre	Ewing et al. 2007
D	Elasticity of VMT with respect to residential density	-0.22	unitless	Stevens 2016

Further explanation of key variables:

- (C) – The residential density of typical development is based on the blended average density of residential development in the U.S. forecasted for 2025. This estimate includes apartments, condominiums, and townhouses, as well as detached single-family housing on both small and large lots. An acre in this context is defined as an acre of developed land, not including streets, school sites, parks, and other undevelopable land. If reductions are being calculated from a specific baseline derived from a travel demand forecasting model, the residential density of the relevant transportation analysis zone should be used instead of the value for a typical development.
- (D) – A meta-regression analysis of five studies that controlled for self-selection found that a 0.22 percent decrease in VMT occurs for every 1 percent increase in residential density (Stevens 2016).

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The percent reduction in GHG emissions (A) is capped at 30 percent. The purpose for the 30 percent cap is to limit the influence of any single built environmental factor (such as density). Projects that implement multiple land use strategies (e.g., density, design, diversity) will show more of a reduction than relying on improvements from a single built environment factor.

Subsector Maximum

($\sum A_{max_{T\text{-}1 \text{ through } T\text{-}4}} \leq 65\%$) This measure is in the Land Use subsector. This subcategory includes Measures T-1 through T-4. The VMT reduction from the combined implementation of all measures within this subsector is capped at 65 percent.

Example GHG Reduction Quantification

The user reduces VMT by increasing the residential density of the project study area. In this example, the project's residential density would be 15 du per acre (B), which would reduce GHG emissions from project VMT by 14.2 percent.

$$A = \frac{15 \frac{du}{ac} - 9.1 \frac{du}{ac}}{9.1 \frac{du}{ac}} \times -0.22 = -14.2\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A).

T-2. Increase Job Density

GHG Mitigation Potential

Up to 30.0% of GHG emissions from project VMT in the study area

Co-Benefits (icon key on pg. 34)

Climate Resilience

Increased density can put people closer to resources they may need to access during an extreme weather event. Increased density can also shorten commutes, decreasing the amount of time people are on the road and exposed to hazards such as extreme heat or flooding.

Health and Equity Considerations

Increased job density may increase nearby housing prices. Jurisdictions should consider the jobs-housing balance and consider measures to reduce displacement and increase affordable housing.

Measure Description

This measure accounts for the VMT reduction achieved by a project that is designed with a higher density of jobs compared to the average job density in the U.S. Increased densities affect the distance people travel and provide greater options for the mode of travel they choose. Increasing job density results in shorter and fewer trips by single-occupancy vehicles and thus a reduction in GHG emissions.

Subsector

Land Use

Locational Context

Urban, suburban

Scale of Application

Project/Site

Implementation Requirements

This measure is most accurately quantified when applied to larger developments and/or developments where the density is somewhat similar to the surrounding neighborhood.

Cost Considerations

Areas with increased job density generally have higher economic gross metropolitan product (GMP) and job growth. Prosperity, measured as GMP per job, also grows faster in areas with increased job density. Decreased commute times and car use may also generate funds for public transit and reduce the need for infrastructure spending on road maintenance.

Expanded Mitigation Options

When paired with Measure T-1, *Increase Residential Density*, the cumulative densification from these measures can result in a highly walkable and bikeable area, yielding increased co-benefits in VMT reductions, improved public health, and social equity.

GHG Reduction Formula

$$A = \frac{B - C}{C} \times D$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from project VMT in study area	0–30.0	%	calculated
User Inputs				
B	Job density of project development	[ ]	jobs per acre	user input
Constants, Assumptions, and Available Defaults				
C	Job density of typical development	145	jobs per acre	ITE 2020
D	Elasticity of VMT with respect to job density	-0.07	unitless	Stevens 2016

Further explanation of key variables:

- (C) – The jobs density is based on the calculated density of a development with a floor-area ratio of 1.0 and 300 square feet (sf) of building space per employee:

  $$\frac{43{,}560 \frac{\text{sf}}{\text{acre}}}{300 \frac{\text{sf}}{\text{employee}}} \times 1.0 \frac{\text{sf}}{\text{acre}} = 145 \frac{\text{employees}}{\text{acre}}$$

  If reductions are being calculated from a specific baseline derived from a travel demand forecasting model, the job density of the relevant transportation analysis zone should be used for this variable instead of the default value presented above.
- (D) – A meta-regression analysis of two studies that controlled for self-selection found that a 0.07 percent decrease in VMT occurs for every 1 percent increase in job density (Stevens 2016).

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The percent reduction in GHG emissions (A) is capped at 30 percent. The purpose for the 30 percent cap is to limit the influence of any single built environmental factor (such as density). Projects that implement multiple land use strategies (e.g., density, design, diversity) will show more of a reduction than relying on improvements from a single built environment factor.

Subsector Maximum

($\sum A_{max_{T\text{-}1 \text{ through } T\text{-}4}} \leq 65\%$) This measure is in the Land Use subsector. This subcategory includes Measures T-1 through T-4. The VMT reduction from the combined implementation of all measures within this subsector is capped at 65 percent.

Example GHG Reduction Quantification

The user reduces VMT by increasing the job density of the project study area. In this example, the project's job density would be 400 jobs per acre (B), which would reduce GHG emissions from project VMT by 12.3 percent.

$$A = \frac{400 \frac{job}{acre} - 145 \frac{job}{acre}}{145 \frac{job}{acre}} \times -0.07 = -12.3\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A).

T-3. Provide Transit-Oriented Development

GHG Mitigation Potential

Up to 31.0% of GHG emissions from project VMT in study area

Co-Benefits (icon key on pg. 34)

Climate Resilience

Providing TOD puts a large number of people close to reliable public transportation, diversifying their transportation options during an extreme weather event.

Health and Equity Considerations

TOD may increase housing prices, leading to gentrification and displacement. Please refer to the *Accountability and Anti-Displacement and Housing* section in Chapter 5, *Measures for Advancing Health and Equity*, for potential strategies to minimize disruption to existing residents. TOD coupled with affordable housing options can help to support equity by helping to lower transportation costs for residents and increase active mobility.

Measure Description

This measure would reduce project VMT in the study area relative to the same project sited in a non-transit-oriented development (TOD) location. TOD refers to projects built in compact, walkable areas that have easy access to public transit, ideally in a location with a mix of uses, including housing, retail offices, and community facilities. Project site residents, employees, and visitors would have easy access to high-quality public transit, thereby encouraging transit ridership and reducing the number of single-occupancy vehicle trips and associated GHG emissions.

Subsector

Land Use

Locational Context

Urban and suburban. Rural only if adjacent to commuter rail station with convenient rail service to a major employment center.

Scale of Application

Project/Site

Implementation Requirements

To qualify as a TOD, the development must be a residential or office project that is within a 10-minute walk (0.5 mile) of a high frequency transit station (either rail, or bus rapid transit with headways less than 15 minutes). Ideally, the distance should be no more than 0.25 to 0.3 of a mile but could be up to 0.5 mile if the walking route to station can be accessed by pedestrian-friendly routes. Users should confirm "unmitigated" or "baseline" VMT does not already account for reductions from transit proximity.

Cost Considerations

TOD reduces car use and car ownership rates, providing cost savings to residents. It can also increase property values and public transit use rates, providing additional revenue to municipalities, as well as open new markets for business development. Increased transit use will likely necessitate increased spending on maintaining and improving public transit systems, the costs of which may be high.

Expanded Mitigation Options

When building TOD, a best practice is to incorporate bike and pedestrian access into the larger network to increase the likelihood of transit use.

GHG Reduction Formula

$$A = \frac{(B \times C)}{-D}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from project VMT in study area	6.9–31.0	%	calculated
User Inputs				
	None			
Constants, Assumptions, and Available Defaults				
B	Transit mode share in surrounding city	Table T-3.1	%	FHWA 2017a
C	Ratio of transit mode share for TOD area with measure compared to existing transit mode share in surrounding city	4.9	unitless	Lund et al. 2004
D	Auto mode share in surrounding city	Table T-3.1	%	FHWA 2017b

Further explanation of key variables:

- (B and D) – Ideally, the user will calculate transit and auto mode share for a Project/Site at a scale no larger than a census tract. Ideally, variables B and D will reflect travel behavior in locations that are *not* already within 0.5 mile of a high-quality transit stop and may instead substitute data from nearby tracts further from transit if such locations exist. Potential data sources include the U.S. Census, California Household Travel Survey (preferred), or local survey efforts. If the user is not able to provide a project-specific value using one of these data sources, they have the option to input the mode share for one of the six most populated core-based statistical areas (CBSAs) in California, as presented in Table T-3.1 in Appendix C, *Emission Factors and Data Tables*. Transit mode share is likely to be smaller for areas not covered by the listed CBSAs, which represent the most transit-accessible areas of the state. Conversely, auto mode share is likely to be larger.
- (C) – A study of people living in TODs in California found that, on average, transit shares for TOD residents exceed the surrounding city by a factor of 4.9 (Lund et al. 2004).

GHG Calculation Caps or Maximums

Measure Maximum

$((B \times C)_{max})$ The transit mode share in the project study area with the measure is capped at 27 percent. This is based on the weighted average transit commute mode share of five surveyed sites in California where residents lived within 3 miles of rail stations (Lund et al. 2004). As transit mode share is typically higher for commute trips compared to all trips, 27 percent represents a reasonable upper bound for expected transit mode share in a TOD

area. Projects in the CBSAs of San Francisco-Oakland-Hayward and San Jose-Sunnyvale-Santa Clara would have their transit mode share capped at 27 percent in the formula.

(A_{max}) For projects that use default CBSA data from Table T-3.1 in Appendix C, the maximum percent reduction in GHG emissions (A) is 31.0 percent. This is based on a project in the CBSA of San Francisco-Oakland-Hayward with a transit mode share that reaches the cap ($(B \times C)_{max}$). This maximum scenario is presented in the below example quantification.

Subsector Maximum

($\sum A_{max_{T\text{-}1 \text{ through } T\text{-}4}} \leq 65\%$) This measure is in the Land Use subsector. This subcategory includes Measures T-1 through T-4. The VMT reduction from the combined implementation of all measures within this subsector is capped at 65 percent.

Example GHG Reduction Quantification

The user reduces VMT by locating their project in a TOD location. Project site residents, employees, and visitors would have easy access to high-quality public transit, thereby encouraging transit use and reducing single occupancy vehicle travel. In this example, the project is within the San Jose-Sunnyvale-Santa Clara CBSA with an existing transit mode share (B) of 6.69 percent. Applying a 4.9 ratio of transit mode share for TOD area with the measure compared to existing transit mode share in the surrounding city yields 33 percent, which exceeds the 27 percent cap ($(B \times C)_{max}$). Therefore, 27 percent is used to define ($B \times C$). The existing vehicle mode share is 86.96 percent (D). The user would reduce GHG emissions from project study area VMT (as compared to the same project in a non-TOD location) by 31 percent.

$$A = \frac{27\%}{-86.96\%} = -31\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A).

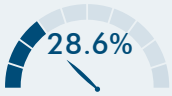
T-4. Integrate Affordable and Below Market Rate Housing

GHG Mitigation Potential



Up to 28.6% of GHG emissions from project/site multifamily residential VMT

Co-Benefits (icon key on pg. 34)

Climate Resilience

Increasing affordable housing creates the opportunity for a greater diversity of people to be closer to their desired destinations and the resources they may need to access during an extreme weather event. Close proximity to destinations allows for more opportunities to use active transportation and transit and to be less reliant on private vehicles. Alleviating the housing-cost burden also enables more people to remain housed, and increases people's capacity to respond to disruptions, including climate impacts.

Health and Equity Considerations

Neighborhoods should include different types of housing to support a variety of household sizes, age ranges, abilities, and incomes.

Measure Description

This measure requires below market rate (BMR) housing. BMR housing provides greater opportunity for lower income families to live closer to job centers and achieve a jobs/housing match near transit. It is also an important strategy to address the limited availability of affordable housing that might force residents to live far away from jobs or school, requiring longer commutes. The quantification method for this measure accounts for VMT reductions achieved for multifamily residential projects that are deed restricted or otherwise permanently dedicated as affordable housing.

Subsector

Land Use

Locational Context

Urban, suburban

Scale of Application

Project/Site

Implementation Requirements

Multifamily residential units must be permanently dedicated as affordable for lower income families. The California Department of Housing and Community Development (2021) defines lower-income as 80 percent of area median income or below, and affordable housing as costing 30 percent of gross household income or less.

Cost Considerations

Depending on the source of the affordable subsidy, BMR housing may have implications for development costs but would also have the benefit of reducing costs for public services, similar to Measure T-1, *Increase Residential Density*.

Expanded Mitigation Options

Pair with Measure T-1, *Increase Residential Density*, and Measure T-2, *Increase Job Density*, to achieve greater population and employment diversity.

GHG Reduction Formula

$A = B \times C$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from Project/Site VMT for multifamily residential developments	0–28.6	%	calculated
User Inputs				
B	Percent of multifamily units permanently dedicated as affordable	0–100	%	user input
Constants, Assumptions, and Available Defaults				
C	Percent reduction in VMT for qualified units compared to market rate units	-28.6	%	ITE 2021

Further explanation of key variables:

- (B) – This refers to percent of multifamily units in the project that are deed restricted or otherwise permanently dedicated as affordable.
- (C) – The 11th Edition of the *ITE Trip Generation Manual* (ITE 2021) contains daily vehicle trip rates for market rate multifamily housing that is low-rise and not close to transit (ITE code 221) as well as affordable multifamily housing (ITE code 223). While these rates do not account for trip length, they serve as a proxy for the expected difference in vehicle trip generation and VMT generation presuming similar trip lengths for both types of land use. If the user has information about trip length differences between market rate and affordable housing, then adjusting the percent reduction accordingly is recommended.

  Users should note that the ITE trip rate estimates are based on a small sample of studies for the affordable housing rate and that no stratification of affordable housing by number of stories was available. This is an important distinction since the multifamily low-rise vehicle trip rate applies to four or fewer stories. Therefore, this measure may not apply to affordable housing projects with more than four stories.

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The maximum GHG reduction from this measure is 28.6 percent. This maximum scenario is presented in the below example quantification.

Subsector Maximum

($\sum A_{max_{T\text{-}1 \text{ through } T\text{-}4}} \leq 65\%$) This measure is in the Land Use subsector. This subsector includes Measures T-1 through T-4. The VMT reduction from the combined implementation of all measures within this subsector is capped at 65 percent.

Example GHG Reduction Quantification

The user reduces project VMT by requiring a portion of the multifamily residential units to be permanently dedicated as affordable. In this example, the percent of units (B) is 100 percent, which would reduce GHG emissions from VMT by 28.6 percent.

$$A = 100\% \times -28.6\% = -28.6\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A).

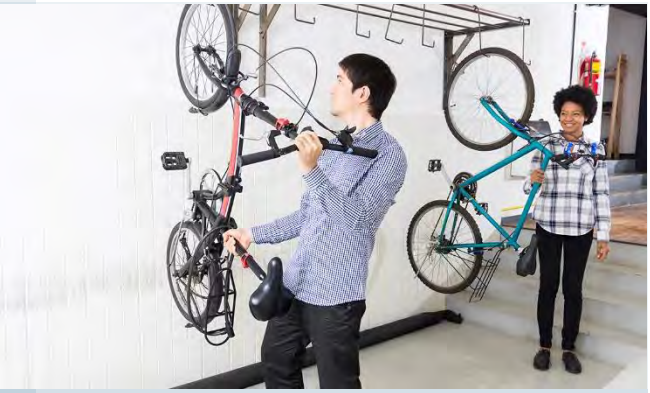
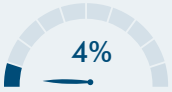
T-5. Implement Commute Trip Reduction Program (Voluntary)



GHG Mitigation Potential



Up to 4.0% of GHG emissions from project/site employee commute VMT

Co-Benefits (icon key on pg. 34)

Climate Resilience

CTR programs could result in less traffic, potentially reducing congestion or delays on major roads during peak AM and PM traffic periods. When this reduction occurs during extreme weather events, it better allows emergency responders to access a hazard site. Lower transportation costs would also increase community resilience by freeing up resources for other purposes.

Health and Equity Considerations

Design of CTR programs need to ensure equitable access and benefits to all employees are provided considering disparate existing mobility options in diverse communities.

Measure Description

This measure will implement a voluntary commute trip reduction (CTR) program with employers. CTR programs discourage single-occupancy vehicle trips and encourage alternative modes of transportation such as carpooling, taking transit, walking, and biking, thereby reducing VMT and GHG emissions. Voluntary implementation elements are described in this measure.

Subsector

Trip Reduction Programs

Locational Context

Urban, suburban

Scale of Application

Project/Site

Implementation Requirements

Voluntary CTR programs must include the following elements to apply the VMT reductions reported in literature.

- Employer-provided services, infrastructure, and incentives for alternative modes such as ridesharing (Measure T-8), discounted transit (Measure T-9), bicycling (Measure T-10), vanpool (Measure T-11), and guaranteed ride home.
- Information, coordination, and marketing for said services, infrastructure, and incentives (Measure T-7).

Cost Considerations

Employer costs may include recurring costs for transit subsidies, capital and maintenance costs for the alternative transportation infrastructure, and labor costs for staff to manage the program. Where the local municipality has a VMT reduction ordinance, costs may include the labor costs for government staff to track the efficacy of the program.

Expanded Mitigation Options

Other strategies may also be included as part of a voluntary CTR program, though they are not included in the VMT reductions reported by literature and thus are not incorporated in the VMT reductions for this measure.

This program typically serves as a complement to the more effective workplace CTR measures such as pricing workplace parking (Measure T-12) or implementing employee parking "cash-out" (Measure T-13).

GHG Reduction Formula

$A = B \times C$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from project/site employee commute VMT	0–4.0	%	calculated
User Inputs				
B	Percent of employees eligible for program	0–100	%	user input
Constants, Assumptions, and Available Defaults				
C	Percent reduction in commute VMT from eligible employees	-4	%	Boarnet et al. 2014

Further explanation of key variables:

- (B) – This refers to the percent of employees that would be able to participate in the program. Employees who might not be able to participate could include those who work nighttime hours when transit and rideshare services are not available or employees who are required to drive to work as part of their job duties. This input does not refer to the percent of employees who participate in the program.
- (C) – A policy brief summarizing the results of employer-based trip reduction studies concluded that these programs reduce total commute VMT for employees at participating work sites by 4 to 6 percent (Boarnet et al. 2014). To be conservative, the low end of the range is cited.

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The maximum GHG reduction from this measure is 4 percent. This maximum scenario is presented in the below example quantification.

Subsector Maximum

($\sum A_{max_{T\text{-}5 \text{ through } T\text{-}13}} \leq 45\%$) This measure is in the Trip Reduction Programs subsector. This subcategory includes Measures T-5 through T-13. The employee commute VMT reduction from the combined implementation of all measures within this subsector is capped at 45 percent.

Mutually Exclusive Measures

If this measure is selected, the user may not also take credit for Measure T-6, which represents the same implementation activities as Measure T-5, except that the CTR program would be mandatory. Users should select either Measure T-5 or T-6.

If this measure is selected, the user may not also take credit for Measures T-7 through T-11. Measure T-5 accounts for the combined GHG reductions achieved by each of these individual measures. To combine the GHG reductions from T-5 with any of these measures would be considered double counting. However, the user may take credit for Measures T-12 through T-13 within the larger CTR subcategory, so long as the combined VMT reduction does not exceed 45 percent, as noted above.

Example GHG Reduction Quantification

The user reduces employee commute VMT by requiring that employers of a project offer a voluntary commute trip reduction program to their employees. In this example, the percent of employees eligible (B) is 100 percent, which would reduce GHG emissions from employee commute VMT by 4 percent.

$$A = 100\% \times -4\% = -4\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A).

T-6. Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring)

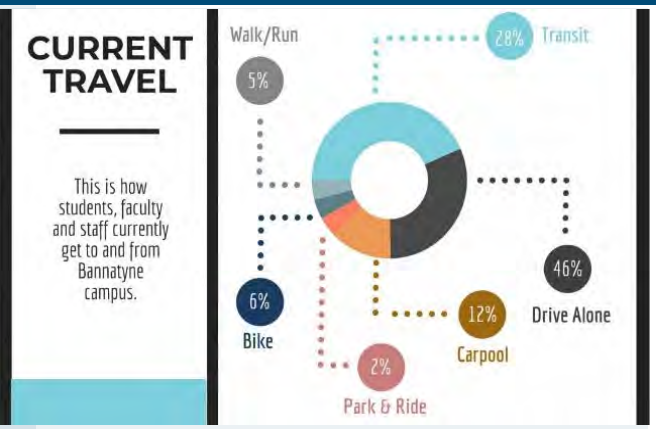

Photo Credit: University of Manitoba, 2018

GHG Mitigation Potential

Up to 26.0% of GHG emissions from project/site employee commute VMT

Co-Benefits (icon key on pg. 34)

Climate Resilience

Commute trip reduction programs could result in less traffic, potentially reducing congestion or delays on major roads during peak AM and PM traffic periods. When this reduction occurs during extreme weather events, it better allows emergency responders to access a hazard site. Lower transportation costs would also increase community resilience by freeing up resources for other purposes.

Health and Equity Considerations

Design of CTR programs needs to consider existing mobility options in diverse communities and ensure equitable access and benefit to all employees.

Measure Description

This measure will implement a mandatory CTR program with employers. CTR programs discourage single-occupancy vehicle trips and encourage alternative modes of transportation such as carpooling, taking transit, walking, and biking, thereby reducing VMT and GHG emissions.

Subsector

Trip Reduction Programs

Locational Context

Urban, suburban

Scale of Application

Project/Site

Implementation Requirements

The mandatory CTR program must include all other elements (i.e., Measures T-7 through T-11) described for the voluntary program (Measure T-5) plus include mandatory trip reduction requirements (including penalties for non-compliance) and regular monitoring and reporting to ensure the calculated VMT reduction matches the observed VMT reduction.

Cost Considerations

Employer costs may include recurring, direct costs for transit subsidies, capital and maintenance costs for alternative transportation infrastructure, and labor costs for staff to manage the program. If the local municipality has a mandatory VMT reduction ordinance, additional employer costs could include non-compliance penalties if the municipality fines CTR programs that do not meet a VMT goal. Municipal costs may include the labor costs for government staff to track the efficacy of the program, which may be outweighed by revenue generated from fines collected from non-compliant businesses.

Expanded Mitigation Options

This program typically serves as a complement to the more effective workplace CTR measures, such as pricing workplace parking (Measure T-12) or implementing employee parking "cash-out" (Measure T-13).

GHG Reduction Formula

$A = B \times C \times D$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from project/site employee commute VMT	0–26.0	%	calculated
User Inputs				
B	Percent of employees eligible for program	0–100	%	user input
Constants, Assumptions, and Available Defaults				
C	Percent reduction in vehicle mode share of employee commute trips	-26	%	Nelson\Nygaard Consulting Associates 2015
D	Adjustment from vehicle mode share to commute VMT	1	unitless	assumed

Further explanation of key variables:

- (B) – This refers to the percent of employees that would be able to participate in the program. This will usually be 100 percent. Employees who might not be able to participate could include those who work nighttime hours when transit and rideshare services are not available or employees who are required to drive to work as part of their job duties. This input does not refer to the percent of employees who participate in the program.
- (C) – A multiyear study of mode share on Genentech's South San Francisco campuses tracked the long-run change in employee commute mode share with implementation of mandatory CTR. Between 2006 and 2014, employee vehicle mode share (includes single-occupied vehicles and carpools) decreased from approximately 90 percent to 64 percent, which is a 26 percent reduction (Nelson\Nygaard Consulting Associates 2015).
- (D) – The adjustment factor from vehicle mode share to commute VMT is 1. This assumes that all vehicle trips will average out to typical trip length. Thus, it can be assumed that a percentage reduction in vehicle trips will equal the same percentage reduction in VMT.

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The maximum GHG reduction from this measure is 26 percent. This maximum scenario is presented in the below example quantification.

Subsector Maximum

($\sum A_{max_{T\text{-}5 \text{ through } T\text{-}13}} \leq 45\%$) This measure is in the Trip Reduction Programs subsector. This subcategory includes Measures T-5 through T-13. The employee commute VMT reduction from the combined implementation of all measures within this subsector is capped at 45 percent.

Mutually Exclusive Measures

If this measure is selected, the user may not also take credit for Measure T-5, which represents the same implementation activities as Measure T-5, except that the CTR program would be mandatory. Users should select either Measure T-5 or T-6.

If this measure is selected, the user may not also take credit for Measures T-7 through T-11. Measure T-6 accounts for the combined GHG reductions achieved by each of these individual measures. To combine the GHG reductions from T-6 with any of these measures would be considered double counting. However, the user may take credit for Measure T-12 and T-13 within the larger CTR subcategory, so long as the combined VMT reduction does not exceed 45 percent, as noted above.

Example GHG Reduction Quantification

The user reduces employee commute VMT by requiring that the employer of the proposed project offer a mandatory CTR program to their employees. In this example, the percent of employees eligible (B) is 100 percent, which would reduce GHG emissions from employee commute VMT by 26 percent.

$$A = 100\% \times -26\% \times 1 = -26\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A).

- Nelson/Nygaard Consulting Associates. 2015. *Genentech–South San Francisco Campus TDM and Parking Report*. June. Available: http://ci-ssf-ca.granicus.com/MetaViewer.php?view_id=2&clip_id=859&meta_id=62028. Accessed: January 2021.

T-7. Implement Commute Trip Reduction Marketing

Photo Credit: Sacramento Area Council of Governments, 2012

GHG Mitigation Potential

Up to 4.0% of GHG emissions from project/site employee commute VMT

Co-Benefits (icon key on pg. 34)

Climate Resilience

Commute trip reduction programs could result in less traffic, potentially reducing congestion or delays on major roads during peak AM and PM traffic periods. When this reduction occurs during extreme weather events, it better allows emergency responders to access a hazard site. Lower transportation costs would also increase community resilience by freeing up resources for other purposes.

Health and Equity Considerations

Design of CTR programs needs to consider existing mobility options in diverse communities and ensure equitable access and benefit to all employees. CTR programs may need to include multi-language materials.

Measure Description

This measure will implement a marketing strategy to promote the project site employer's CTR program. Information sharing and marketing promote and educate employees about their travel choices to the employment location beyond driving such as carpooling, taking transit, walking, and biking, thereby reducing VMT and GHG emissions.

Subsector

Trip Reduction Programs

Locational Context

Urban, suburban

Scale of Application

Project/Site

Implementation Requirements

The following features (or similar alternatives) of the marketing strategy are essential for effectiveness.

- Onsite or online commuter information services.
- Employee transportation coordinators.
- Onsite or online transit pass sales.
- Guaranteed ride home service.

Cost Considerations

Employer costs include labor and materials for development and distribution of survey and marketing materials to promote the program and educate potential participants.

Expanded Mitigation Options

This measure could be packaged with other commute trip reduction measures (Measures T-8 through T-13) as a comprehensive CTR program (Measure T-5 or T-6).

GHG Reduction Formula

$A = B \times C \times D$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from project/site employee commute VMT	0–4.0	%	calculated
User Inputs				
B	Percent of employees eligible for program	0–100	%	user input
Constants, Assumptions, and Available Defaults				
C	Percent reduction in employee commute vehicle trips	-4	%	TRB 2010
D	Adjustment from vehicle trips to VMT	1	unitless	assumed

Further explanation of key variables:

- (B) – This refers to the percent of employees that would be able to participate in the program. This will usually be 100 percent. Employees who might not be able to participate could include those who work nighttime hours when transit and rideshare services are not available or employees who are required to drive to work as part of their job duties. This input does not refer to the percent of employees who actually participate in the program.
- (C) – A review of studies measuring the effect of transportation demand management measures on traveler behavior notes that the average empirically-based estimate of reductions in vehicle trips for full-scale, site-specific employer support programs is 4 to 5 percent. To be conservative, the low end of the range is cited (TRB 2010).
- (D) – The adjustment factor from vehicle trips to VMT is 1. This assumes that all vehicle trips will average out to typical trip length ("assumes all trip lengths are equal"). Thus, it can be assumed that a percentage reduction in vehicle trips will equal the same percentage reduction in VMT.

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The maximum GHG reduction from this measure is 4 percent. This maximum scenario is presented in the below example quantification.

Subsector Maximum

($\sum A_{max_{T\text{-}5 \text{ through } T\text{-}13}} \leq 45\%$) This measure is in the Trip Reduction Programs subsector. This subcategory includes Measures T-5 through T-13. The employee commute VMT reduction from the combined implementation of all measures within this subsector is capped at 45 percent.

Mutually Exclusive Measures

If this measure is selected, the user may not also take credit for either Measure T-5 or T-6. However, this measure may be implemented alongside other individual CTR measures (Measures T-8 through T-13). The efficacy of individual programs may vary highly based on individual employers and local contexts.

Example GHG Reduction Quantification

The user reduces employee commute VMT by requiring that employers of a project market to employees travel options for modes alternative to single-occupied vehicles. In this example, the percent of employees eligible (B) is 100 percent, which would reduce GHG emissions from employee commute VMT by 4 percent.

$$A = 100\% \times -4\% \times 1 = -4\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A).

Sources

- Transportation Research Board (TRB). 2010. *Traveler Response to Transportation System Changes Handbook, Third Edition: Chapter 19, Employer and Institutional TDM Strategies*. June. Available: http://www.trb.org/Publications/Blurbs/163781.aspx. Accessed: January 2021.

T-8. Provide Ridesharing Program

GHG Mitigation Potential

Up to 8.0% of GHG emissions from project/site employee commute VMT

Co-Benefits (icon key on pg. 34)

Climate Resilience

Ridesharing programs could result in less traffic, potentially reducing congestion or delays on major roads during peak AM and PM traffic periods. When this reduction occurs during extreme weather events, it better allows emergency responders to access a hazard site. Lower transportation costs would also increase community resilience by freeing up resources for other purposes.

Health and Equity Considerations

Program should include all onsite workers, such as contractors, interns, and service workers. Because ridesharing is vehicle-based, and some employees may not be in areas with feasible rideshare networks, design of programs need to ensure equitable benefits to those with and without access to rideshare opportunities.

Measure Description

This measure will implement a ridesharing program and establish a permanent transportation management association with funding requirements for employers. Ridesharing encourages carpooled vehicle trips in place of single-occupied vehicle trips, thereby reducing the number of trips, VMT, and GHG emissions.

Subsector

Trip Reduction Programs

Locational Context

Urban, suburban

Scale of Application

Project/Site

Implementation Requirements

Ridesharing must be promoted through a multifaceted approach. Examples include the following.

- Designating a certain percentage of desirable parking spaces for ridesharing vehicles.
- Designating adequate passenger loading and unloading and waiting areas for ridesharing vehicles.
- Providing an app or website for coordinating rides.

Cost Considerations

Costs of developing, implementing, and maintaining a rideshare program in a way that encourages participation are generally borne by municipalities or employers. The beneficiaries include the program participants saving on commuting costs, the employer reducing onsite parking expenses, and the municipality reducing cars on the road, which leads to lower infrastructure and roadway maintenance costs.

Expanded Mitigation Options

When providing a ridesharing program, a best practice is to establish funding by a non-revocable funding mechanism for employer-provided subsidies. In addition, encourage use of low-emission ridesharing vehicles (e.g., shared Uber Green).

This measure could be paired with any combination of the other commute trip reduction strategies (Measures T-7 through T-13) for increased reductions.

GHG Reduction Formula

$A = B \times C$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from project/site employee commute VMT	0–8.0	%	calculated
User Inputs				
B	Percent of employees eligible for program	0–100	%	user input
Constants, Assumptions, and Available Defaults				
C	Percent reduction in employee commute VMT	Table T-8.1	%	SANDAG 2019

Further explanation of key variables:

- (B) – This refers to the percent of employees that would be able to participate in the program. This will usually be 100 percent. Employees who might not be able to participate could include those who work nighttime hours when transit and rideshare services are not available or employees who are required to drive to work as part of their job duties. This input does not refer to the percent of employees who actually participate in the program.
- (C) – The percent reduction in employee commute VMT by place type is provided in Table T-8.1 in Appendix C. The reduction differs by place type because the willingness and ability to participate in carpooling is higher in urban areas than in suburban areas. Note that this measure is not applicable for implementation in rural areas (SANDAG 2019).

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The maximum GHG reduction from this measure is 8 percent.

Subsector Maximum

($\sum A_{max_{T\text{-}5 \text{ through } T\text{-}13}} \leq 45\%$) This measure is in the Trip Reduction Programs subsector. This subcategory includes Measures T-5 through T-13. The employee commute VMT reduction from the combined implementation of all measures within this subsector is capped at 45 percent.

Mutually Exclusive Measures

If this measure is selected, the user may not also take credit for either Measure T-5 or T-6. However, this measure may be implemented alongside other individual CTR measures (Measures T-7 and T-9 through T-13). The efficacy of individual programs may vary highly based on individual employers and local contexts.

Example GHG Reduction Quantification

The user reduces employee commute VMT by requiring that employers of a project provide a ridesharing program to their employees. In this example, the percent of employees eligible (B) at a packaging and distribution center is 50 percent and the place type of the project is urban (C). GHG emissions from employee commute VMT would be reduced by 4 percent.

$A = 50\% \times -8\% = -4\%$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A).

Sources

- San Diego Association of Governments (SANDAG). 2019. *Mobility Management VMT Reduction Calculator Tool–Design Document*. June. Available: https://www.icommutesd.com/docs/default-source/planning/tool-design-document_final_7-17-19.pdf?sfvrsn=ec39eb3b_2. Accessed: January 2021.

T-9. Implement Subsidized or Discounted Transit Program

GHG Mitigation Potential

Up to 5.5% of emissions from employee/resident vehicles accessing the site

Co-Benefits (icon key on pg. 34)

Climate Resilience

Subsidized and discounted transit programs increase the capacity of low-income populations to use transit to evacuate or access resources during an extreme weather event. They could also incentivize more people to use transit, resulting in less traffic and better allowing emergency responders to access a hazard site during an extreme weather event. Lower overall out-of-pocket costs would also help increase community resilience by freeing up resources for other purposes.

Health and Equity Considerations

Program should include all onsite workers, such as contractors, interns, and service workers.

Measure Description

This measure will provide subsidized or discounted, or free transit passes for employees and/or residents. Reducing the out-of-pocket cost for choosing transit improves the competitiveness of transit against driving, increasing the total number of transit trips and decreasing vehicle trips. This decrease in vehicle trips results in reduced VMT and thus a reduction in GHG emissions.

Subsector

Trip Reduction Programs

Locational Context

Urban, suburban

Scale of Application

Project/Site

Implementation Requirements

The project should be accessible either within 1 mile of high-quality transit service (rail or bus with headways of less than 15 minutes), 0.5 mile of local or less frequent transit service, or along a designated shuttle route providing last-mile connections to rail service. If a well-established bikeshare service (Measure T-22-A) is available, the site may be located up to 2 miles from a high-quality transit service.

If more than one transit agency serves the site, subsidies should be provided that can be applied to each of the services available. If subsidies are applied for only one service, all variable inputs below should also pertain only to the service that is subsidized.

Cost Considerations

The employer cost is the recurring, direct cost for transit subsidies. The subsidies will lower the per capita income of the transit service, decreasing the revenue of the local transit agency. This cost may be offset by increased revenue from increased ridership. The beneficiaries include the program participants saving on commuting cost, the employer reducing onsite parking expenses, and the municipality reducing cars on the road, which leads to lower infrastructure and roadway maintenance costs.

Expanded Mitigation Options

This measure could be paired with any combination of the other commute trip reduction strategies (Measures T-7 through T-13) for increased reductions.

GHG Reduction Formula

$$A = \frac{C}{B} \times G \times D \times E \times F \times H \times I$$

GHG Calculation Variables

If subsidies or discounts target employees, the GHG reduction from this measure may be limited to work-related employee trips only (i.e., home-to- work) and work-to-other, where at least one trip end is work). If residents are targeted, the GHG reductions extend to all trips.

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from employee/resident vehicles accessing the site	0–5.5	%	calculated
User Inputs				
B	Average transit fare without subsidy	[ ]	$	user input
C	Subsidy amount	[ ]	$	user input
D	Percent of employees/residents eligible for subsidy	0–100	%	user input
E	Percent of project-generated VMT from employees/residents	0–100	%	user input
Constants, Assumptions, and Available Defaults				
F	Transit mode share of all trips or work trips	Table T-3.1 or Table T-9.1	%	FHWA 2017
G	Elasticity of transit boardings with respect to transit fare price	-0.43	unitless	Taylor et al. 2008
H	Percent of transit trips that would otherwise be made in a vehicle	50	%	Handy & Boarnet 2013
I	Conversion factor of vehicle trips to VMT	1.0	unitless	assumption

Further explanation of key variables:

- (B and C) – The average transit fare and subsidy amount can be presented as either a fare per ride, or the cost of a monthly pass for typical transit service near the site. Pricing should be based on the expected means of subsidy implementation; for instance, if a monthly pass is provided to all residents, prices should be input on a monthly basis.
- (D) – The percentage of employees/residents associated with the site who have access to the subsidy. If subsidy is provided as an employee benefit, care should be taken to account for any contract or temporary workers who do not receive such benefits.
- (E) – The percentage of project-generated VMT from employees/residents is used to adjust the percent reduction in GHG emissions from the scale of employee and/or resident-generated VMT to project-generated VMT. If subsidies or discounts target employees at an office development, this value would simply be 100 percent. If the project site is a multifamily development with no onsite workers, this value would also be

100 percent. If the project site is a retail development, this value would be less than 100 percent, as it does not account for retail shopper trips to the site. The share of total VMT generated by employees for visitor-intensive uses, such as retail or medical offices, can be roughly estimated by multiplying the total number of employees by two (to account for both arrival and departure), divided by the total number of daily trips.

- (F) – Ideally, the user will calculate transit mode share for work trips or all trips of a Project/Site at a scale no larger than a census tract. Potential data sources include the U.S. Census, California Household Travel Survey (preferred), or local survey efforts. Care should be taken *not* to present the reported commute mode share as retrieved from the American Community Survey (ACS), unless the land use is office or employment based and the tables are based on work location (rather than home location). If the subsidies or discounts target employees and their commute trips, then the mode share should use the home-to-work trip purpose. If the user is not able to provide a project-specific value using one of the data sources described above, they have the option to input the transit mode share for one of the six most populated CBSAs in California. The transit mode share for work trips by CBSA is presented in Table T-9.1 in Appendix C (FHWA 2017). The transit mode share for all trips is provided in Table T-3.1 in Appendix C.
- (G) – A cross-sectional analysis of transit use in 265 urbanized areas in the U.S. found that a 0.43 percent decrease in transit boardings occurs for every 1 percent increase in transit fare price (Taylor et al. 2008). A policy brief summarizing the results of transit service strategies found this analysis to fall in the mid-point of observed, short-term values (Handy & Boarnet 2013). Price elasticities of transit demand vary based on both long-term and short-term demand, service type, and service location (Litman 2020 and Handy & Boarnet 2013).
- (H) – Not all new transit trips replace a vehicle trip. The share of transit trips that would otherwise be made by private vehicle ranges from less than 5 percent to 50 percent across studies. This assumption is based on observed values for high quality BRT service under the assumption that this measure is implemented alongside marketing measures and is targeted primarily at reducing vehicle commute trips. (Handy & Boarnet 2013). Note that this study looked at service improvements rather than fare changes and is used as a proxy variable. If project-specific or location-specific information is available, it should be substituted for this assumptive variable.
- (I) – The adjustment factor from vehicle trips to VMT is 1. This assumes that all vehicle trips will average out to typical trip length ("assumes all trip lengths are equal"). Thus, it can be assumed that a percentage reduction in vehicle trips will equal the same percentage reduction in VMT. Subsidies or discounts targeting commute trips may have a higher factor as they are generally longer than the trip lengths for other purposes.

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The GHG reduction is capped at 5.5 percent, which is based on the following assumptions:

- (C=B) – The subsidy coverage is capped at 100 percent of the typical transit fare.
- (D) – All employees are eligible for the subsidy.

- (E) – All project-generated VMT is from employee-generated VMT.
- (F) – Employees at an office development in the San Francisco-Oakland-Hayward CBSA have a default transit mode share for work trips of 25.60 percent.

Subsector Maximum

$(\sum A_{max_{T\text{-}5 \text{ through } T\text{-}13}} \leq 45\%)$ This measure is in the Trip Reduction Programs subsector. This subcategory includes Measures T-5 through T-13. The employee commute VMT reduction from the combined implementation of all measures within this subsector is capped at 45 percent.

Mutually Exclusive Measures

If this measure is selected, the user may not also take credit for either Measure T-5 or T-6. However, this measure may be implemented alongside other individual CTR measures (Measures T-7, T-8, T-10 through T-13). The efficacy of individual programs may vary highly based on individual employers and local contexts.

Example GHG Reduction Quantification

In this example, the user reduces VMT by providing all employees (D) of a proposed office development in the San Francisco-Oakland-Hayward CBSA a 100 percent transit subsidy in the form of a $100 monthly transit pass (C=B). The user would reduce GHG emissions from VMT by 5.5 percent.

$$A = \left(\frac{\$100}{\$100} \times -0.43\right) \times 100\% \times 100\% \times 25.60\% \times 50\% \times 1 = -5.5\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A).

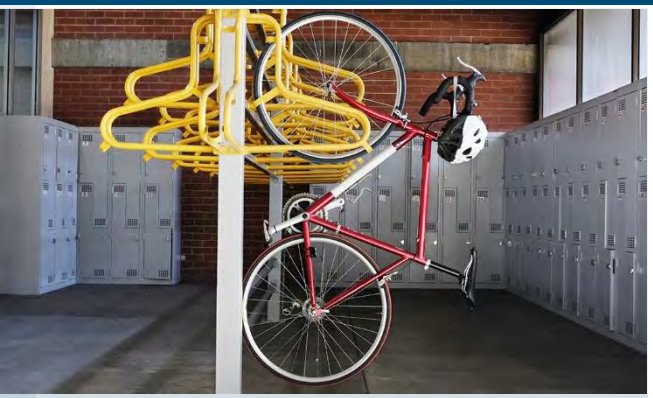
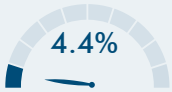
T-10. Provide End-of-Trip Bicycle Facilities



GHG Mitigation Potential



Up to 4.4% of GHG emissions from project/site employee commute VMT

Co-Benefits (icon key on pg. 34)

Climate Resilience

End-of-trip bicycle facilities could take more cars off the road, resulting in less traffic and better allowing emergency responders to access a hazard site during an extreme weather event. They could also make it easier for bicycle users to access resources in an extreme weather event.

Health and Equity Considerations

Facilities should be inclusive of all gender identities and expressions. Consider including gender-neutral, single-occupancy options to allow for additional privacy for those who want it.

Measure Description

This measure will install and maintain end-of-trip facilities for employee use. End-of-trip facilities include bike parking, bike lockers, showers, and personal lockers. The provision and maintenance of secure bike parking and related facilities encourages commuting by bicycle, thereby reducing VMT and GHG emissions.

Subsector

Trip Reduction Programs

Locational Context

Urban, suburban

Scale of Application

Project/Site

Implementation Requirements

End-of-trip facilities should be installed at a size proportional to the number of commuting bicyclists and regularly maintained.

Cost Considerations

Employer costs include capital and maintenance costs for construction and maintenance of facilities and potentially labor and materials costs for staff to monitor facilities and provide marketing to encourage use of new facilities. The beneficiaries include the program participants saving on commuting cost, the employer reducing onsite parking expenses, and the municipality reducing cars on the road, which leads to lower infrastructure and roadway maintenance costs.

Expanded Mitigation Options

Best practice is to include an onsite bicycle repair station and post signage on or near secure parking and personal lockers with information about how to reserve or obtain access to these amenities.

This measure could be paired with any combination of the other commute trip reduction strategies (Measures T-7 through T-13) for increased reductions.

GHG Reduction Formula

$$A = \frac{C \times (E - (B \times E))}{D \times F}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from employee project/site commute VMT	0.1–4.4	%	calculated
User Inputs				
	None			
Constants, Assumptions, and Available Defaults				
B	Bike mode adjustment factor	1.78 or 4.86	unitless	Buehler 2012
C	Existing bicycle trip length for all trips in region	Table T-10.1	miles	FHWA 2017a
D	Existing vehicle trip length for all trips in region	Table T-10.1	miles	FHWA 2017a
E	Existing bicycle mode share for work trips in region	Table T-10.2	%	FHWA 2017b
F	Existing vehicle mode share for work trips in region	Table T-10.2	%	FHWA 2017b

Further explanation of key variables:

- (B) – The bike mode adjustment factor should be provided by the user based on type of bike facility. A study found that commuters with showers, lockers, and bike parking at work are associated with 4.86 times greater likelihood to commute by bicycle when compared to individuals without any bicycle facilities at work. Individuals with bike parking, but no showers and lockers at the workplace, are associated with 1.78 times greater likelihood to cycle to work than those without trip-end facilities (Buehler 2012).
- (C and D) – Ideally, the user will calculate bicycle and auto trip length for a Project/Site at a scale no larger than a census tract. Potential data sources include the U.S. Census, California Household Travel Survey (preferred), or local survey efforts. If the user is not able to provide a project-specific value using one of these data sources, they have the option to input the trip lengths for bicycles and vehicles for one of the six most populated CBSAs in California, as presented in Table T-10.1 in Appendix C (FHWA 2017a). Trip lengths are likely to be longer for areas not covered by the listed CBSAs, which represent the denser areas of the state.
- (E and F) – Ideally, the user will calculate bicycle and auto mode share for work trips for a Project/Site at a scale no larger than a census tract. Potential data sources include the U.S. Census, California Household Travel Survey (preferred), or local survey efforts. If the user is not able to provide a project-specific value using one of these data sources, they have the option to input the regional average mode shares for bicycle and vehicle

work trips for one of the six most populated CBSAs in California, as presented in Table T-10.2 in Appendix C (FHWA 2017b). If the project study area is not within the listed CBSAs or the user is able to provide a project-specific value, the user should replace these regional defaults in the GHG reduction formula. For areas not covered by the listed CBSAs, which represent the denser areas of the state, bicycle mode share is likely to be lower and vehicle share higher than presented in Table T-10.2.

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The maximum GHG reduction from this measure is 4.4 percent. This maximum scenario is presented in the below example quantification.

Subsector Maximum

($\sum A_{max_{T\text{-}5 \text{ through } T\text{-}13}} \leq 45\%$) This measure is in the Trip Reduction Programs subsector. This subcategory includes Measures T-5 through T-13. The employee commute VMT reduction from the combined implementation of all measures within this subsector is capped at 45 percent.

Mutually Exclusive Measures

If this measure is selected, the user may not also take credit for either Measure T-5 or T-6. However, this measure may be implemented alongside other individual CTR measures (Measures T-7, T-8, T-9, and T-11 through T-13). The efficacy of individual programs may vary highly based on individual employers and local contexts.

Example GHG Reduction Quantification

The user reduces VMT by providing end-of-trip facilities for the project's employees, which encourages bicycle trips in place of vehicle trips. In this example, the type of bike facility provided by the project is parking with showers, bike lockers, and personal lockers (B). The project is within San Jose-Sunnyvale-Santa Clara CBSA, and the user does not have project-specific values for trip lengths and mode shares and for bicycles and vehicles. Per Tables T-10.1 and T-10.2 in Appendix C, inputs for these variables are 2.8 miles, 11.5 miles, 4.1 percent, and 86.6 percent, respectively (C, D, E, and F). GHG emissions from employee commute VMT would be reduced by 4.4 percent.

$$A = \frac{2.8 \text{ miles} \times \left(4.1\% - (4.86 \times 4.1\%)\right)}{11.5 \text{ miles} \times 86.6\%} = \text{-}4.4\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be

calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A).

T-11. Provide Employer-Sponsored Vanpool

Photo Credit: UCLA Transportation/Flickr, 2021

GHG Mitigation Potential

Up to 20.4% of GHG emissions from project/site employee commute VMT

Co-Benefits (icon key on pg. 34)

Climate Resilience

Employer-sponsored vanpools could result in less traffic, potentially reducing congestion or delays on major roads during peak AM and PM traffic periods. When this reduction occurs during extreme weather events, it better allows emergency responders to access a hazard site.

Health and Equity Considerations

Consider using zero-emission or plug-in electric vehicles (PHEVs) for additional emission reduction benefits.

Measure Description

This measure will implement an employer-sponsored vanpool service. Vanpooling is a flexible form of public transportation that provides groups of 5 to 15 people with a cost-effective and convenient rideshare option for commuting. The mode shift from long-distance, single-occupied vehicles to shared vehicles reduces overall commute VMT, thereby reducing GHG emissions.

Subsector

Trip Reduction Programs

Locational Context

Urban, suburban, rural

Scale of Application

Project/Site

Implementation Requirements

Vanpool programs are more appropriate for the building occupant or tenant (i.e., employer) to implement and monitor than the building owner or developer.

Cost Considerations

Employer costs primarily include the capital costs of vehicle acquisition and the labor costs of drivers, either through incentives to current employees or the hiring of dedicated drivers. The beneficiaries include the program participants saving on commuting cost, the employer reducing onsite parking expenses, and the municipality reducing cars on the road, which leads to lower infrastructure and roadway maintenance costs.

Expanded Mitigation Options

When implementing a vanpool service, best practice is to subsidize the cost for employees that have a similar origin and destination and provide priority parking for employees that vanpool.

This measure could be paired with any combination of the other commute trip reduction strategies (Measures T-7 through T-13) for increased reductions.

GHG Reduction Formula

$$A = \frac{((1 - B) \times C \times F) + \left(B \times \frac{D}{E} \times G\right)}{((1 - B) \times C \times F) + (B \times D \times F)} - 1$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from project/site employee commute VMT	3.4–20.4	%	calculated
User Inputs				
	None			
Constants, Assumptions, and Available Defaults				
B	Percent of employees that participate in vanpool program	2.7	%	SANDAG 2019
C	Average length of one-way vehicle commute trip in region	Table T-11.1	miles per trip	FHWA 2017
D	Average length of one-way vanpool commute trip	42.0	miles per trip	SANDAG 2019
E	Average vanpool occupancy (including driver)	6.25	occupants	SANDAG 2019
F	Average emission factor of average employee vehicle	307.5	g CO_2e per mile	CARB 2020
G	Vanpool emission factor	763.4	g CO_2e per mile	CARB 2020

Further explanation of key variables:

- (B) – The percent of employees that would participate in a vanpool program is based on a survey of commuters in San Diego County (SANDAG 2019). If the project is not within San Diego County or the user is able to provide a project-specific value for within San Diego County, the user should replace the default employee participation rate in the GHG reduction formula.
- (C) – Ideally, the user will calculate auto commute trip lengths for a Project/Site at a scale no larger than a census tract. Potential data sources include the U.S. Census, California Household Travel Survey (preferred), or local survey efforts. If the user is not able to provide a project-specific value using one of these data sources, they have the option to input the regional average one-way auto commute trip length for one of the six most populated CBSAs in California, as presented in Table T-11.1 in Appendix C (FHWA 2017). Trip lengths are likely to be longer for areas not covered by the listed CBSAs, which represent the denser areas of the state.
- (D and E) – The average one-way vanpool commute trip length and occupancy are based on data from the San Diego Association of Government's regional vanpool program (SANDAG 2019). If the project is not within San Diego County or the user is

able to provide a project-specific value for within San Diego County, the user should replace these defaults in the GHG reduction formula.

- (F and G) – The average GHG emission factors for employee commute and vanpool vehicles were calculated in terms of CO_2e per mile using EMFAC2017 (v1.0.3). The model was run for a 2020 statewide average using diesel and gasoline fuel. The average of the light-duty automobile (LDA) and light duty truck (LDT1/LDT2) vehicle categories represents employee non-vanpool vehicles and the light-heavy duty truck (LHDT1) vehicle category conservatively represents a large cargo vanpool vehicle. The running emission factors for CO_2, CH_4, and N_2O (CARB 2020) were multiplied by the corresponding 100-year GWP values from the IPCC's Fourth Assessment Report (IPCC 2007). If the user can provide a project-specific value (i.e., for a future year and project location), the user should run EMFAC to replace the defaults in the GHG reduction formula.

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) For projects in San Diego County that use default CBSA data from Table T-11.1 and (B_{max}), the maximum percent reduction in GHG emissions (A) is 20.4 percent. This maximum scenario is presented in the below example quantification.

(B_{max}) The percent of employees that participate in the vanpool program is capped at 15 percent, which is based on the high end of vanpool participation survey data for several successful programs in the U.S. (SANDAG 2019).

Subsector Maximum

($\sum A_{max_{T\text{-}5 \text{ through } T\text{-}13}} \leq 45\%$) This measure is in the Trip Reduction Programs subsector. This subcategory includes Measures T-5 through T-13. The employee commute VMT reduction from the combined implementation of all measures within this subsector is capped at 45 percent.

Mutually Exclusive Measures

If this measure is selected, the user may not also take credit for either Measure T-5 or T-6. However, this measure may be implemented alongside other individual CTR measures (Measures T-7 through T-10, T-12, and T-13). The efficacy of individual programs may vary highly based on individual employers and local contexts.

Example GHG Reduction Quantification

The user reduces employee commute VMT by requiring that the employer of the project to sponsor a vanpool program. In this example, the project is in the San Diego-Carlsbad CBSA and would have an average vehicle commute trip length of 14.52 miles (C). The percent of employees that participate in the vanpool program is 15 percent (B_{max}). GHG emissions from employee commute would be reduced by 20.4 percent.

$$A = \frac{\left((1-15\%) \times 14.52 \frac{\text{miles}}{\text{trip}} \times 307.5 \frac{\text{g } CO_2e}{\text{miles}}\right) + \left(15\% \times \frac{42 \frac{\text{miles}}{\text{trip}}}{6.25 \text{ occupants}} \times 763.4 \frac{\text{g } CO_2e}{\text{miles}}\right)}{\left((1-15\%) \times 14.52 \frac{\text{miles}}{\text{trip}} \times 307.5 \frac{\text{g } CO_2e}{\text{miles}}\right) + \left(15\% \times 42 \frac{\text{miles}}{\text{trip}} \times 307.5 \frac{\text{g } CO_2e}{\text{miles}}\right)} - 1 = -20.4\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption (H) can be calculated using the GHG reduction formula except that (F) and (G) should be replaced by (I) and (J), as follows.

Fuel Use Reduction Formula

$$H = \frac{\left((1-B) \times C \times I\right) + \left(B \times \frac{D}{E} \times J\right)}{\left((1-B) \times C \times I\right) + (B \times D \times I)} - 1$$

Fuel Use Reduction Calculation Variables

ID	Variable	Value	Unit	Source
Output				
H	Percent reduction in fuel use from project/site employee commute VMT	4.7–21.4	%	calculated
User Inputs				
	None			
Constants, Assumptions, and Available Defaults				
I	Fuel efficiency of average employee vehicle	0.03639	gallon (gal) per mile	CARB 2020
J	Fuel efficiency of vanpool vehicle	0.08328	gal per mile	CARB 2020

Further explanation of key variables:

- (I and J) – The average fuel efficiencies for employee commute and vanpool vehicles were calculated using EMFAC2017 (v1.0.3). The model was run for a 2020 statewide average using diesel and gasoline fuel. The average of the LDA,

LDT1, and LDT2 vehicle categories represents employee non-vanpool vehicles, and the LHDT1 vehicle category conservatively represents a large cargo vanpool vehicle. If the user can provide a project-specific value (i.e., for a future year and project location), the user should run EMFAC to replace the defaults in the fuel use reduction formula.

- Please refer to the GHG Calculation Variables table above for definitions of variables that have been previously defined.

VMT Reductions

The percent reduction in VMT can be calculated using a modified version of the GHG reduction formula, as shown below.

$$\%\ \text{VMT Reduction} = \frac{((1 - B) \times C) + \left(B \times \frac{D}{E}\right)}{C} - 1$$

T-12. Price Workplace Parking

GHG Mitigation Potential

Up to 20.0% of GHG emissions from project/site employee commute VMT

Co-Benefits (icon key on pg. 34)

Climate Resilience

Priced workplace parking could incentivize increased use of public transit and thus result in less traffic, potentially reducing congestion or delays on major roads during peak AM and PM traffic periods. When this reduction occurs during extreme weather events, it better allows emergency responders to access a hazard site.

Health and Equity Considerations

Parking pricing should include hourly and daily options so part-time staff do not need a monthly pass. If the project includes low-waged employees that have fewer transportation choices or time and resource constraints, it is instead recommended to consider implementing Measure T-13, *Implement Employee Parking Cash-Out*, or other transportation subsidy.

Measure Description

This measure will price onsite parking at workplaces. Because free employee parking is a common benefit, charging employees to park onsite increases the cost of choosing to drive to work. This is expected to reduce single-occupancy vehicle commute trips, resulting in decreased VMT, thereby reducing associated GHG emissions.

Subsector

Trip Reduction Programs

Locational Context

Urban, suburban

Scale of Application

Project/Site

Implementation Requirements

Implementation may include the following.

- Explicitly charging for employee parking.
- Implementing above-market rate pricing.
- Validating parking only for invited guests (or not providing parking validation at all).
- Not providing employee parking and transportation allowances.

In addition, this measure should include marketing and education regarding available alternatives to driving.

Cost Considerations

Parking fees would be a direct, recurring cost for employees. Employer costs include labor costs for program management and monitoring, but this may be offset by revenue generated by the program.

Expanded Mitigation Options

Best practice is to ensure that other transportation options are available, convenient, and have competitive travel times (i.e., transit service near the project site, shuttle service, or a complete active transportation network serving the site and surrounding community), and that there is not alternative free parking available nearby (such as on-street). This measure is substantially less effective in environments that do not have other modes available or where unrestricted street parking or other offsite parking is available nearby and has adequate capacity to accommodate project-related vehicle parking demand.

GHG Reduction Formula

For calculating effectiveness of pricing residential parking, see Measure T-16, *Unbundle Residential Parking Costs from Property Cost*. For calculating effectiveness of pricing parking at visitor-intensive land uses, see Measure T-24, *Implement Market Price Public Parking (On-Street)*.

$$A = \frac{B - C}{C} \times E \times D \times F$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from employee commute VMT	0–20.0	%	calculated
User Inputs				
B	Proposed parking price	[ ]	$	user input
C	Baseline parking price	[ ]	$	user input
D	Share of employees paying for parking	[ ]	%	user input
Constants, Assumptions, and Available Defaults				
E	Elasticity of parking demand with respecting to parking price	-0.4	unitless	Lehner & Peer 2019
F	Ratio of vehicle trip reduction to VMT	1	unitless	assumption

Further explanation of key variables:

- (B) – Parking price can be provided on an hourly, daily, or monthly basis. Monthly pricing is less effective than requiring daily or hourly payment since the price signal is diluted to only once a month.
- (C) – If baseline parking price is $0 (that is, if parking is typically free), set C = ¼ B, allowing for the maximum 50 percent increase in price. Alternatively, for locations that are located within 0.5 mile of transit service, set C = average transit fare to/from the location.
- (D) – Many organizations allow some employees free parking benefits. VMT reductions should be adjusted based on the share of employees that would be paying for parking.
- (E) – A meta-analysis of parking price studies found that a 0.40 percent decrease in parking demand occurs for every 1 percent increase in parking price (Lehner & Peer 2019). Price elasticity of parking demand varies by location, day of the week, and time of day.
- (F) – The adjustment factor from vehicle trips to VMT is 1. This assumes that all vehicle trips will average out to typical trip length ("assumes all trip lengths are equal"). Thus, it can be assumed that a percentage reduction in vehicle trips will equal the same percentage reduction in VMT. Subsidies or discounts targeting commute trips may have a higher factor as they are generally longer than the trip lengths for other purposes.

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The GHG reduction from priced workplace parking is capped at 20 percent. This maximum scenario is presented in the below example quantification.

($\left(\frac{B-C}{C}\right)_{max}$) The percent increase in parking price is capped at 50 percent.

Subsector Maximum

($\sum A_{max_{T\text{-}5 \text{ through } T\text{-}13}} \leq 45\%$) This measure is in the Trip Reduction Programs subsector. This subcategory includes Measures T-5 through T-13. The employee commute VMT reduction from the combined implementation of all measures within this subsector is capped at 45 percent.

Mutually Exclusive Measures

If this measure is selected, the user may not also take credit for Measure T-13, *Implement Employee Parking Cash-Out*. While both measures focus on providing a price signal for employees to consider other modes for their work commute, this measure actively charges all employees to park, while Measure T-13 reimburses employees who do not park. Users should select either Measure T-12 or T-13.

Example GHG Reduction Quantification

The user reduces VMT by increasing the price of a monthly parking permit. In this example, the permit fee is increased from $50 (C) to $75 (B). If 100 percent of employees are subject to parking pricing (D), the user would reduce GHG emissions from VMT by 20 percent.

$$A = \frac{\$75 - \$50}{\$50} \times -0.4 \times 100\% \times 1 = -20\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

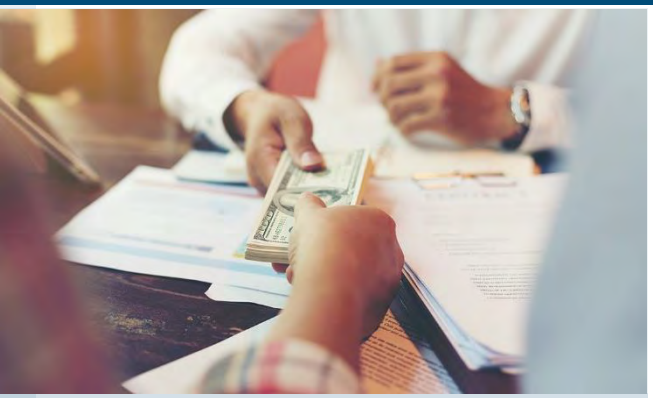
VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A).

Sources

- Lehner, S., Peer, S. 2019. *The Price Elasticity of Parking: A Meta-analysis*. Transportation Research Part A: Policy and Practice 121 2019. Available: http://sustainabletransportationsc.org/garage/pdf/parking_elasticity.pdf. Accessed: January 2021.

T-13. Implement Employee Parking Cash-Out



GHG Mitigation Potential

Up to 12.0% of GHG emissions from project/site employee commute VMT

Co-Benefits (icon key on pg. 34)

Climate Resilience

Employee parking cash-out could incentivize increased use of public transit and thus result in less traffic, potentially reducing congestion or delays on major roads during peak AM and PM traffic periods. When this reduction occurs during extreme weather events, it better allows emergency responders to access a hazard site.

Health and Equity Considerations

Non-applicable

Measure Description

This measure will require project employers to offer employee parking cash-out. Cash-out is when employers provide employees with a choice of forgoing their current subsidized/free parking for a cash payment equivalent to or greater than the cost of the parking space. This encourages employees to use other modes of travel instead of single occupancy vehicles. This mode shift results in people driving less and thereby reduces VMT and GHG emissions.

Subsector

Trip Reduction Programs

Locational Context

Urban, suburban

Scale of Application

Project/Site

Implementation Requirements

To prevent spill-over parking and continued use of single occupancy vehicles, residential parking in the surrounding area must be permitted, and public on-street parking must be market rate.

Cost Considerations

Employer costs include the recurring, direct cost for payment to program participants and labor costs for program management. Employees that participate in the program would achieve cost savings through the cash-out benefit and potentially through reduced vehicle ownership and usage.

Expanded Mitigation Options

This measure could be paired with many other commute trip reduction strategies (Measures T-7 through T-11) for increased reductions.

GHG Reduction Formula

$A = B \times C$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from project/site commute VMT	0–12.0	%	calculated
User Inputs				
B	Percentage of employees eligible	[ ]	%	user input
Constants, Assumptions, and Available Defaults				
C	Percent reduction in commute VMT from implementation of measure	-12	%	Shoup 2005

Further explanation of key variables:

- (B) – The percentage of employees eligible refers to the employees that would be able to participate in the program. This will usually be 100 percent. Employees who might not be able to participate could include those who work nighttime hours when transit and rideshare services are not available or employees who are required to drive to work as part of their job duties. This does not refer to the percentage of employees who end up participating in the program.
- (C) – A study of eight California firms that complied with California's 1992 parking cash-out law found employee commute VMT decreased by an average of 12 percent (Shoup 2005).

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The maximum percent reduction in GHG emissions (A) is 12.0 percent. This maximum scenario is presented in the below example quantification.

Subsector Maximum

($\sum A_{max_{T\text{-}5 \text{ through } T\text{-}13}} \leq 45\%$) This measure is in the Trip Reduction Programs subsector. This subcategory includes Measures T-5 through T-13. The employee commute VMT reduction from the combined implementation of all measures within this subsector is capped at 45 percent.

Mutually Exclusive Measures

If this measure is selected, the user may not also take credit for Measure T-12, *Price Workplace Parking*. While both measures focus on providing a price signal for employees to consider other modes for their work commute, this measure reimburses employees who

do not park, while Measure T-12 actively charges all employees to park. Users should select either Measure T-12 or T-13.

Example GHG Reduction Quantification

The user reduces project/site VMT by offering commuters the option to choose a cash payment equal to or greater than the current parking subsidy offered by their employer. In this example, all employees (i.e., 100 percent) are eligible to participate (B), which would reduce GHG emissions from employee commute VMT by 12 percent.

$$A = 100\% \times -12\% = -12\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A).

- Shoup, D. 2005. *Parking Cash Out*. Planners Advisory Service, American Planning Association. Available: http://shoup.bol.ucla.edu/ParkingCashOut.pdf. Accessed: January 2021.

T-14. Provide Electric Vehicle Charging Infrastructure

GHG Mitigation Potential

Up to 11.9% of GHG emissions from vehicles accessing the commercial or multifamily housing building

Co-Benefits (icon key on pg. 34)

Climate Resilience

Providing electric vehicle charging infrastructure increases fuel redundancy for electric vehicles even if an extreme weather event disrupts other fuel sources. Electric vehicles could also provide benefits to buildings and the grid, such as emergency backup, energy reserves, and demand response.

Health and Equity Considerations

Differential costs of PHEVs compared to conventional vehicles are decreasing over time, but at present are more expensive, which means this measure could disproportionately benefit those of greater economic means. As costs come into parity over time, this will be less of an issue. Employer, electricity provider, and state incentives for PHEV purchase could help address near-term disparities.

Measure Description

Install onsite electric vehicle chargers in an amount beyond what is required by the 2019 California Green Building Standards (CALGreen) at buildings with designated parking areas (e.g., commercial, educational, retail, multifamily). This will enable drivers of PHEVs to drive a larger share of miles in electric mode (eVMT), as opposed to gasoline-powered mode, thereby displacing GHG emissions from gasoline consumption with a lesser amount of indirect emissions from electricity. Most PHEVs owners charge their vehicles at home overnight. When making trips during the day, the vehicle will switch to gasoline mode if/when it reaches its maximum all-electric range.

Subsector

Parking or Road Pricing/Management

Locational Context

Urban, suburban, rural

Scale of Application

Project/Site

Implementation Requirements

Parking at the chargers must be limited to electric vehicles.

Cost Considerations

The primary costs associated with electric vehicle charging infrastructure include the capital costs of purchasing and installing charging stations, electricity costs from use of stations, and maintenance costs of keeping the charging stations in working order. Costs initially fall to the station owners, either municipalities or private owners, but can be passed along to station users with usage fees. Depending on station placement and charging times required for PHEVs, businesses near charging stations can derive benefits from patronage of station users.

Expanded Mitigation Options

In addition to increasing the percentage of electric miles for PHEVs, the increased availability of chargers from implementation of this measure could mitigate consumer "range anxiety" concerns and increase the adoption and use of battery electric vehicles (BEVs), but this potential effect is not included in the calculations as a conservative assumption. Expanded mitigation could include quantification of the effect of this measure on BEV use.

GHG Reduction Formula

$$A = \frac{B \times D \times (F - E) \times (G - (H \times I \times K \times L))}{-C \times J}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from vehicles accessing the office building or housing	0–11.9	%	calculated
User Inputs				
B	Number of chargers installed at site	[ ]	integer	user input
C	Total vehicles accessing the site per day	[ ]	integer	user input
Constants, Assumptions, and Available Defaults				
D	Average number of PHEVs served per day per charger installed	2	integer	CARB 2019
E	Percent of PHEV miles in electric mode without measure	46	%	CARB 2020a
F	Percent of PHEV miles in electric mode with measure	80	%	CARB 2017
G	Average emission factor of PHEV in gasoline mode	205.1	g CO_2e per mile	CARB 2020a; U.S. DOE 2021
H	Energy efficiency of PHEV in electric mode	0.327	kilowatt hours (kWh) per mile	CARB 2020b; U.S. DOE 2021
I	Carbon intensity of local electricity provider	Tables E-4.3 and E-4.4	lb CO_2e per megawatt hour (MWh)	CA Utilities 2021
J	Average emission factor of non-electric vehicles accessing the site	307.5	g CO_2e per mile	CARB 2020a
K	conversion from lb to g	454	g per lb	conversion
L	Conversion from kWh to MWh	0.001	MWh per kWh	conversion

Further explanation of key variables:

- (D) – The average number of PHEVs served per day per charger installed is 2 vehicles (CARB 2019). If the user can provide a project-specific value, they should replace the default in the GHG reduction formula.
- (E) - Based on the EMFAC2017 model (v1.0.3), 46 percent of miles traveled by PHEVs in California are eVMT, and 54 percent are in gasoline mode (CARB 2020a).

- (F) – A review of EV user surveys and analytics included in the CARB's *Advanced Clean Cars Mid-Term Report* suggest that PHEV owners can reach 80 percent eVMT with access to adequate supportive charging infrastructure (CARB 2017).
- (G) – As described for (J), the average GHG emission factor for gasoline vehicles is 307.5 grams of CO_2e per mile.
- The fuel efficiency of a PHEV in gasoline mode is calculated as 66.7 percent of the fuel consumption rate of a gasoline vehicle, based on the assumption that a gasoline hybrid vehicle has 50 percent higher fuel economy (miles per gal [mpg]) than a comparable gasoline vehicle, based on a comparison of the gasoline and hybrid Toyota Camry and Corolla models (U.S. DOE 2021). This percentage is applied to the average GHG emission factor for gasoline vehicles to determine the average emission factor for PHEVs in gasoline mode as (66.7%×307.5 g CO_2e per mile). If the user can provide a project-specific value by running EMFAC based on the future year of a project, they should replace the default in the GHG reduction formula.
- (H) – Scaled from a light-duty automobile gasoline equivalent fuel economy 30.3 mpg (CARB 2020a), an energy efficiency ratio (EER) of 2.5 (CARB 2020b), and an assumption of 33.7 kWh electricity per gallon of gasoline (U.S. DOE 2021).
- (I) – GHG intensity factors for major California electricity providers are provided in Tables E-4.3 and E-4.4 in Appendix C. If the project study area is not serviced by a listed electricity provider, or the user is able to provide a project-specific value (i.e., for the future year not referenced in Appendix C), the user should replace the default in the GHG calculation formula. If the electricity provider is not known, the user may elect to use the statewide grid average carbon intensity.
- (J) – The average GHG emission factor for non-electric vehicles accessing the site was calculated in terms of CO_2e per mile using EMFAC2017 (v1.0.3). The model was run for a 2020 statewide average of LDA, LDT1, and LDT2 vehicles using diesel and gasoline fuel. The running emission factors for CO_2, CH_4, and N_2O (CARB 2020a) were multiplied by the corresponding 100-year GWP values from the IPCC's Fourth Assessment Report (IPCC 2007). If the user can provide a project-specific value (i.e., for a future year and project location), the user should run EMFAC to replace the default in the GHG reduction formula.

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The percent reduction in GHG emissions (A) is capped at 11.9 percent, which is based on the following assumptions used to generate a maximum scenario:

- (B) – number of chargers installed = 20. CALGreen provides a non-residential voluntary Tier 2 measure that requires projects with 201 or more parking spaces to allocate 10 percent of total parking spaces for "EV Capable" parking spaces (or 20 parking spaces) (CBSC 2019). Note that EV Capable parking spaces do not actually have EV chargers installed, though they do have electrical panel capacity, a dedicated branch circuit, and a raceway to the EV parking spot to support future installation of charging stations. Therefore, using the number of EV Capable parking spaces as a proxy for EV chargers as a high-end estimate is conservative.

- (C) – total vehicles accessing the site = 200. Per the CALGreen voluntary measure, the number of total parking spaces that correspond with 20 "EV Capable" parking spaces is 201.
- (D) – PHEVs served per day per charger installed = 7. This value is the max (D_{max}). This assumes that all PHEV drivers would coordinate sharing of the limited number of chargers at the site. Value is based on data from the National Renewable Energy Laboratory (CARB 2019).
- (I) – carbon intensity of local electricity provider = 0 lb CO_2e per MWh. This assumes that the local electricity provider is powered 100 percent by renewables and thus has a carbon intensity of zero.

Subsector Maximum

($\sum A_{max_{T\text{-}14 \text{ through } T\text{-}16}} \leq 35\%$) This measure is in the Parking or Road Pricing/Management subsector. This subcategory includes Measures T-14 through T-16. The VMT reduction from the combined implementation of all measures within this subsector is capped at 35 percent.

Example GHG Reduction Quantification

The user will install electric vehicle chargers at their proposed office or multifamily housing development, which will enable employees or residents with PHEVs to drive a larger share of miles in electric mode, as opposed to gasoline-powered mode, thereby displacing GHG emissions from gasoline consumption with a lesser amount of indirect emissions from indirect electricity. In this example, 20 chargers (B) will be installed at a workplace with 200 daily employee vehicles accessing the site (C). The electricity provider for the project area is the Sacramento Municipal Utility District (SMUD) and the analysis year is 2022. The carbon intensity of electricity is therefore 344 lb CO_2e per MWh (I). The GHG impact is calculated as a 3.4 percent reduction from the total emissions from vehicles accessing the site.

$$A = \frac{20 \times 2\frac{\text{PHEVs}}{\text{charger}\cdot\text{day}} \times (80\% - 46\%) \times (205.1\ \frac{\text{g } CO_2e}{\text{miles}} - (0.327\frac{\text{kWh}}{\text{mile}} \times 344\ \frac{\text{lb } CO_2e}{\text{MWh}} \times 454\frac{\text{g}}{\text{lb}} \times 0.001\frac{\text{MWh}}{\text{kWh}}))}{200 \text{ vehicles} \times 307.5\ \frac{\text{g } CO_2e}{\text{miles}}} = 3.4\%$$

Quantified Co-Benefits

While the measure will achieve fuel savings, it will also increase electricity consumption. This section defines the methods for quantifying Improved Local Air Quality and fuel savings, as well as increased electricity consumption.

Improved Local Air Quality

Local criteria pollutants will be reduced by the reduction in fossil fuel combustion. The percent reduction in criteria pollutants can be calculated using the GHG reduction formula. Electricity supplied by statewide fossil-fueled or bioenergy power plants will generate criteria pollutants. However, because these power plants are located throughout the state, electricity consumption from vehicles charging will not generate localized criteria pollutant emissions. Consequently, for the quantification

of criteria pollutant emission reductions, either the electricity portion of the equation can be removed, or the electricity intensity (I) can be set to zero.

Fuel Savings (Increased Electricity)

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in criteria pollutant emissions. The percent increase in electricity use (M) from this measure can be calculated as follows.

Electricity Use Increase Formula

$$M = \frac{B \times D \times (F - E) \times J \times N \times O}{-C \times P}$$

Electricity Use Increase Calculation Variables

ID	Variable	Value	Unit	Source
Output				
M	Increase in electricity from PHEVs	[ ]	%	calculated
User Inputs				
N	Existing electricity consumption of project/site	[ ]	kWh per year	user input
O	Days per year with vehicles accessing the site	260–365	days per year	user input
P	Average annual VMT of vehicles accessing the site	[ ]	miles per day per vehicle	user input
Constants, Assumptions, and Available Defaults				
	None			

Further explanation of key variables:

- (N) – The user should take care to properly quantify building electricity using accepted methodologies (such as CalEEMod).
- (O) – If the proposed development is a workplace in which employees access the site an average of 5 days per week, the user should input 260 workdays. If the development is multifamily dwelling, the user should input 365 days.
- Please refer to the GHG Calculation Variables table above for definitions of variables that have been previously defined.

T-15. Limit Residential Parking Supply

GHG Mitigation Potential

Up to 13.7% of GHG emissions from resident vehicles accessing the site

Co-Benefits (icon key on pg. 34)

Climate Resilience

Limiting residential parking supply could incentivize increased use of public transit and thus result in less traffic, potentially reducing congestion or delays on major roads during peak AM and PM traffic periods. When this reduction occurs during extreme weather events, it better allows emergency responders to access a hazard site. Evacuation plans and plans for transport to cooling/heating/clean air centers during power outages or unhealthy air quality events, however, would need to consider needs of households without access to private vehicles.

Health and Equity Considerations

Limiting parking supply can reduce the cost of housing development and, potentially, increase housing supply and decrease housing expenses. However, this may negatively impact residents that do not have a viable alternative to personal vehicle travel.

Measure Description

This measure will reduce the total parking supply available at a residential project or site. Limiting the amount of parking available creates scarcity and adds additional time and inconvenience to trips made by private auto, thus disincentivizing driving as a mode of travel. Reducing the convenience of driving results in a shift to other modes and decreased VMT and thus a reduction in GHG emissions. Evidence of the effects of reduced parking supply is strongest for residential developments.

Subsector

Parking or Road Pricing/Management

Locational Context

Urban, suburban

Scale of Application

Project/Site

Implementation Requirements

This measure is ineffective in locations where unrestricted street parking or other offsite parking is available nearby and has adequate capacity to accommodate project-related vehicle parking demand.

Cost Considerations

Reducing residential parking supply, especially in high density residential areas, can have high-cost savings if it reduces the need for additional investment in parking infrastructure. Some of these savings may be offset by investments in alternative transport solutions, which will need to be robust to ensure that residents can effectively travel to work and all other destinations without a car.

Expanded Mitigation Options

When limiting parking supply, a best practice is to do so at sites that are located near high quality alternative modes of travel (such as a rail station, frequent bus line, or in a higher density area with multiple walkable locations nearby). Limiting parking supply may also allow for more active uses on any given lot, which may support Measures T-1 and T-2 by allowing for higher density construction.

GHG Reduction Formula

$$A = -\frac{B - C}{B} \times D \times E \times F$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from resident vehicles accessing the site	0–13.7	%	calculated
User Inputs				
B	Residential parking demand	[ ]	parking spaces	user input
C	Project residential parking supply	[ ]	parking spaces	user input
D	Percentage of project VMT generated by residents	[ ]	%	user input
Constants, Assumptions, and Available Defaults				
E	Percent of household VMT that is commute based	37	%	Caltrans 2012
F	Percent reduction in commute mode share by driving among households in areas with scarce parking	37	%	Chatman 2013

Further explanation of key variables:

- (B) – The user can calculate the parking demand in the *ITE Parking Generation Manual* based on the project building square footage or number of du. For residential projects, this demand varies based on the size of each unit, and ranges from 1.0 spaces/unit for one-bedroom apartments to 2.6 spaces/unit for single-family homes with 3+ bedrooms.
- (D) – Available research on changes in parking supply focuses on residential land uses. Therefore, reductions are applied only to the share of VMT generated by residents of a project. For most residential projects, this will be 100 percent; however, for mixed-use projects, the user will need to provide project-specific data.
- (E) – The percent of household VMT that is commute-based varies from location to location; the statewide average is 37 percent (Caltrans 2012). If the user can provide a project-specific value based on their project type and area, they should replace the default in the GHG reduction formula.
- (F) – A study found that among households with limited off-street parking (<1 space per adult), there was a 37 percent decrease in auto mode share for commute trips. The method above pro-rates this reduction based on how much the project's parking supply is reduced from demand rates calculated in the *ITE Parking Generation Manual* (ITE 2019). In addition, this reduction is applied to commute trips only due to the limitations of the research.

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The percent reduction in GHG emissions is capped at 13.7 percent. This occurs for projects that have no onsite parking (C), 100 percent of VMT arising from residential land use (D), and 37 percent of all VMT arising from commute trips (E). This maximum scenario is presented in the below example quantification.

(C>B) Parking supply is considered to be limited when demand (C) exceeds supply (B). If demand is equal to or less than supply, then implementation of this measure would not result in a GHG reduction.

Subsector Maximum

($\sum A_{max_{T\text{-}14 \text{ through } T\text{-}16}} \leq 35\%$) This measure is in the Parking or Road Pricing/Management subsector. This subcategory includes Measures T-14 through T-16. The VMT reduction from the combined implementation of all measures within this subsector is capped at 35 percent.

Example GHG Reduction Quantification

The user reduces VMT by reducing a project's parking supply. In this example, the parking demand per ITE is 100 parking spaces (B) and the project would not supply any parking spaces (C). The user would reduce GHG emissions from VMT by 13.7 percent.

$$A = -\frac{100 \text{ spaces} - 0 \text{ spaces}}{100 \text{ spaces}} \times 100\% \times 37\% \times 37\% = -13.7\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A).

T-16. Unbundle Residential Parking Costs from Property Cost

GHG Mitigation Potential

Up to 15.7% of GHG emissions from project VMT in the study area

Co-Benefits (icon key on pg. 34)

Climate Resilience

Unbundling residential parking costs from property costs could incentivize increased use of public transit and thus result in less traffic, potentially reducing congestion or delays on major roads during peak AM and PM traffic periods. When this reduction occurs during extreme weather events, it better allows emergency responders to access a hazard site.

Health and Equity Considerations

The unbundling of parking costs would help decrease housing costs for individuals who do not own personal vehicles.

Measure Description

This measure will unbundle, or separate, a residential project's parking costs from property costs, requiring those who wish to purchase parking spaces to do so at an additional cost. On the assumption that parking costs are passed through to the vehicle owners/drivers utilizing the parking spaces, this measure results in decreased vehicle ownership and, therefore, a reduction in VMT and GHG emissions. Unbundling may not be available to all residential developments, depending on funding sources.

Subsector

Parking or Road Pricing/Management

Locational Context

Urban, suburban

Scale of Application

Project/Site

Implementation Requirements

Parking costs must be passed through to the vehicle owners/drivers utilizing the parking spaces for this measure to result in decreased vehicle ownership.

Cost Considerations

Unbundling residential parking costs from property costs may decrease revenue for property owners. This loss may be partially offset by reduced costs needed to maintain parking facilities with less car occupancy and the potential for non-resident parking as a supplementary income stream. For residents, reduced fees and the ability to go without owning a car is a major cost benefit. Municipalities also benefit from a reduction of cars on the road, which can lead to lower infrastructure and roadway maintenance costs.

Expanded Mitigation Options

Pair with Measure T-19-A or T-19-B to ensure that residents who eliminate their vehicle and shift to a bicycle can safely access the area's bikeway network.

GHG Reduction Formula

$$A = \frac{B}{C} \times D \times E$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from project VMT in study area	0–15.7	%	calculated
User Inputs				
B	Annual parking cost per space	[ ]	$ per year	user input
Constants, Assumptions, and Available Defaults				
C	Average annual vehicle cost	$9,282	$ per year	AAA 2019
D	Elasticity of vehicle ownership with respect to total vehicle cost	-0.4	unitless	Litman 2020
E	Adjustment factor from vehicle ownership to VMT	1.01	unitless	FHWA 2017

Further explanation of key variables:

- (B) – For most projects, this represents a monthly parking fee multiplied by 12. For deeded parking spaces, an estimate of the additional cost to a mortgage may be used, or the total cost may be prorated over 30 years. Costs to park will vary widely based on location; however, this value should consider if other nearby offsite parking options are available at lower cost. See Table T-16.1 in Appendix C for examples of monthly parking prices for different facility types.
- (C) – The average vehicle cost per year in 2019 was $9,282, based on a car driven 15,000 miles per year. Costs include gasoline, maintenance, insurance, license and registration, loan finance charges, and depreciation but do not include parking (AAA 2019).
- (D) – A synthesis of literature reported that, on the low end, a 0.4 percent decrease in vehicle ownership occurs for every 1 percent increase in total vehicle costs (Litman 2020).
- (E) – The adjustment factor from vehicle ownership to VMT is based on the following (FHWA 2017):
  - The average Californian household with 1 vehicle drives 11,117 miles per vehicle while households with 2 vehicles drives 11,223 miles per vehicle.
  - The reduction of 1 vehicle from a 2-vehicle household leads to a 0.94 percent decrease in VMT per vehicle.
  - So, $E = 1 - \left(\frac{11{,}117 \frac{\text{miles}}{\text{vehicle}} - 11{,}223 \frac{\text{miles}}{\text{vehicle}}}{11{,}223 \frac{\text{miles}}{\text{vehicle}}} \right) = 1.01$

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The GHG reduction from unbundled parking is capped at 15.7 percent, which is based on the use of (B_{max}) in the GHG reduction formula.

(B_{max}) The annual cost of parking space is capped at $3,600, or $300 per month. At monthly costs above $300, the cost of parking represents more than a 30 percent increase in total vehicle cost. In addition, this reflects the upper maximum of observed parking prices outside of extremely dense downtown areas (such as San Francisco's SOMA neighborhood).

Subsector Maximum

($\sum A_{max_{T\text{-}14 \text{ through } T\text{-}16}} \leq 35\%$) This measure is in the Parking or Road Pricing/Management subsector. This subcategory includes Measures T-14 through T-16. The VMT reduction from the combined implementation of all measures within this subsector is capped at 35 percent.

Example GHG Reduction Quantification

The user reduces VMT by unbundling the parking costs from property costs of a project, discouraging vehicle ownership, and therefore reducing VMT. In this example, the annual parking cost per space is $1,800 (B), which would reduce GHG emissions from project study area VMT (as compared to the same project with bundled parking costs) by 7.8 percent.

$$A = \left(\frac{\$1{,}800}{\$9{,}282}\right) \times -0.4 \times 1.01 = -7.8\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A).

T-17. Improve Street Connectivity

GHG Mitigation Potential

Up to 30.0% of GHG emissions from vehicle travel in the plan/community

Co-Benefits (icon key on pg. 34)

Climate Resilience

Improving street connectivity could increase route redundancy, allowing faster and more efficient travel during extreme weather events, evacuations, or for emergency vehicles requiring access to hazard sites.

Health and Equity Considerations

Multiple active modes routing options allows vulnerable road users to choose based on perceived safety, comfort, speed, and other factors.

Measure Description

This measure accounts for the VMT reduction achieved by a project that is designed with a higher density of vehicle intersections compared to the average intersection density in the U.S. Increased vehicle intersection density is a proxy for street connectivity improvements, which help to facilitate a greater number of shorter trips and thus a reduction in GHG emissions.

Subsector

Land Use

Locational Context

Urban, suburban

Scale of Application

Plan/Community

Implementation Requirements

Projects that increase intersection density would be building a new street network in a subdivision or retrofitting an existing street network to improve connectivity (e.g., converting cul-de-sacs or dead-end streets to grid streets).

Cost Considerations

Capital and infrastructure costs for improved street connectivity may be high. Depending on the location, losses may also be incurred through the reduction of sellable land due to the increased street footprint. Benefits come mainly from the reduction of traffic on arterial streets, which reduces congestion and allows for safer use of nonmotorized transportation, such as bikes. These outcomes, in turn, can reduce car usage, which provides costs savings to commuters and municipalities.

Expanded Mitigation Options

Pair with Measure T-18, *Provide Pedestrian Network Improvement*, to best support use of the local pedestrian network.

GHG Reduction Formula

$$A = \frac{B - C}{C} \times D$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from vehicle travel in plan/community	0–30.0	%	calculated
User Inputs				
B	Intersection density in project site with measure	[ ]	intersections per sq mile	user input
Constants, Assumptions, and Available Defaults				
C	Average intersection density	36	intersections per sq mile	Fehr & Peers 2009
D	Elasticity of VMT with respect to intersection density	-0.14	unitless	Stevens 2016

Further explanation of key variables:

- (C) – The average intersection density is based on the standard suburban intersection density in the U.S. (Fehr & Peers 2009). This density is approximately equivalent to block faces of 750 to 800 feet, or cul-de-sac–style built environments, which are appropriate for suburban areas.
- (D) – A meta-regression analysis of 15 studies found that a 0.14 percent decrease in VMT occurs for every 1 percent increase in intersection density (Stevens 2016).

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The percent reduction in GHG emissions (A) is capped at 30 percent. The purpose of the 30 percent cap is to limit the influence of any single built environmental factor (such as intersection density).

Subsector Maximum

Same as (A_{max}). Measure T-17 is the only measure at the Plan/Community scale within the Land Use subsector.

Example GHG Reduction Quantification

The user reduces VMT by constructing their project with a higher intersection density than the surrounding city. In this example, the project intersection density (B) would be 72

intersections per square mile (sq mile), which would reduce GHG emissions from project VMT by 14 percent.

$$A = \frac{72 \frac{\text{int}}{\text{sq mile}} - 36 \frac{\text{int}}{\text{sq mile}}}{36 \frac{\text{int}}{\text{sq mile}}} \times -0.14 = -14\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A).

T-18. Provide Pedestrian Network Improvement

GHG Mitigation Potential

Up to 6.4% of GHG emissions from vehicle travel in the plan/community

Co-Benefits (icon key on pg. 34)

Climate Resilience

Improving pedestrian networks increases accessibility of outdoor spaces, which can provide health benefits and thus improve community resilience. This can also improve connectivity between residents and resources that may be needed in an extreme weather event.

Health and Equity Considerations

Ensure that the improvements also include accessibility features to allow for people of all abilities to use the network safely and conveniently. Ensure that sidewalks connect to nearby community assets, such as schools, retail, and healthcare.

Measure Description

This measure will increase the sidewalk coverage to improve pedestrian access. Providing sidewalks and an enhanced pedestrian network encourages people to walk instead of drive. This mode shift results in a reduction in VMT and GHG emissions.

Subsector

Neighborhood Design

Locational Context

Urban, suburban, rural

Scale of Application

Plan/Community

Implementation Requirements

The GHG reduction of this measure is based on the VMT reduction associated with expansion of sidewalk coverage expansion, which includes not only building of new sidewalks but also improving degraded or substandard sidewalk (e.g., damaged from street tree roots). However, pedestrian network enhancements with non-quantifiable GHG reductions are encouraged to be implemented, as discussed under *Expanded Mitigation Options*.

Cost Considerations

Depending on the improvement, capital and infrastructure costs may be high. However, improvements to the pedestrian network will increase pedestrian activity, which can increase businesses patronage and provide a local economic benefit. The local municipality may achieve cost savings through a reduction of cars on the road leading to lower infrastructure and roadway maintenance costs.

Expanded Mitigation Options

When improving sidewalks, a best practice is to ensure they are contiguous and link externally with existing and planned pedestrian facilities. Barriers to pedestrian access and interconnectivity, such as walls, landscaping buffers, slopes, and unprotected crossings should be minimized. Other best practice features could include high-visibility crosswalks, pedestrian hybrid beacons, and other pedestrian signals, mid-block crossing walks, pedestrian refuge islands, speed tables, bulb-outs (curb extensions), curb ramps, signage, pavement markings, pedestrian-only connections and districts, landscaping, and other improvements to pedestrian safety (see Measure T-35, *Provide Traffic Calming Measures*).

GHG Reduction Formula

$$A = \left(\frac{C}{B} - 1\right) \times D$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from household vehicle travel in plan/community	0–6.4	%	calculated
User Inputs				
B	Existing sidewalk length in study area	[ ]	miles	user input
C	Sidewalk length in study area with measure	[ ]	miles	user input
Constants, Assumptions, and Available Defaults				
D	Elasticity of household VMT with respect to the ratio of sidewalks-to-streets	-0.05	unitless	Frank et al. 2011

Further explanation of key variables:

- (B and C) – Sidewalk length should be measured on both sides of the street. For example, if one 0.5-mile-long street has full sidewalk coverage, the sidewalk length would be 1.0 mile. If there is only sidewalk on one side of the street, the sidewalk length would be 0.5 mile. The recommended study area is 0.6 mile around the pedestrian network improvement. This represents a 6- to 10-minute walking time.
- (D) – A study found that a 0.05 percent decrease in household vehicle travel occurs for every 1 percent increase in the sidewalk-to-street ratio (Frank et al. 2011; Handy et al. 2014).

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The percent reduction in GHG emissions (A) is capped at 3.4 percent, which is based on the following assumptions:

- 35.2 percent of vehicle trips are short trips (2 mile or less, average of 1.29 miles) and thus could easily shift to walking (FHWA 2019).
- 64.8 percent of vehicle trips are longer trips that are unlikely to shift to walking (2 miles or more, average of 10.93 miles) (FHWA 2019).
- So $A_{max} = \frac{35.2\% \times 1.29 \text{ miles}}{64.8\% \times 10.93 \text{ miles}} = 6.4\%$

Subsector Maximum

($\sum A_{max_{T\text{-}18 \text{ through } T\text{-}22\text{-}C}} \leq 10\%$) This measure is in the Neighborhood Design subsector. This subcategory includes Measures T-18 through T-22-C. The VMT reduction from the combined implementation of all measures within this subsector is capped at 10 percent.

Example GHG Reduction Quantification

The user reduces household VMT by improving the pedestrian network in the study area. In this example, the existing sidewalk length (B) is 9 miles, and the sidewalk length with the measure (C) would be 10 miles. With these conditions, the user would reduce GHG emissions from household VMT within the study area by 0.6 percent.

$$A = \left(\frac{10 \text{ miles}}{9 \text{ miles}} - 1\right) \times -0.05 = -0.6\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in household VMT would be the same as the percent reduction in GHG emissions (A).

Improved Public Health

Users are directed to the Integrated Transport and Health Impact Model (ITHIM) (CARB et al. 2020). The ITHIM can quantify the annual change in health outcomes associated with active transportation, including deaths, years of life lost, years of living with disability, and incidence of community and individual disease.

T-19-A. Construct or Improve Bike Facility

GHG Mitigation Potential

Up to 0.8% of GHG emissions from vehicles parallel roadways

Co-Benefits (icon key on pg. 34)

Climate Resilience

Constructing and improving bike facilities can incentivize more bicycle use and decrease vehicle use, which have health benefits and can thus improve community resilience. This can also improve connectivity between residents and resources that may be needed in an extreme weather event.

Health and Equity Considerations

Prioritize low-income and underserved areas and communities with lower rates of vehicle ownership or fewer transit options. Make sure that the bicycle facility connects to a larger existing bikeway network that accesses destinations visited by low-income or underserved communities.

Measure Description

This measure will construct or improve a single bicycle lane facility (only Class I, II, or IV) that connects to a larger existing bikeway network. Providing bicycle infrastructure helps to improve biking conditions within an area. This encourages a mode shift on the roadway parallel to the bicycle facility from vehicles to bicycles, displacing VMT and thus reducing GHG emissions. When constructing or improving a bicycle facility, a best practice is to consider local or state bike lane width standards. A variation of this measure is provided as T-19-B, *Construct or Improve Bike Boulevard*.

Subsector

Neighborhood Design

Locational Context

Urban, suburban

Scale of Application

Plan/Community. This measure reduces VMT on the roadway segment parallel to the bicycle facility (i.e., the corridor). An adjustment factor is included in the formula to scale the VMT reduction from the corridor level to the plan/community level.

Implementation Requirements

The bicycle lane facility must be either Class I, II, or IV. Class I bike paths are physically separated from motor vehicle traffic. Class IV bikeways are protected on-street bikeways, also called cycle tracks. Class II bike lanes are striped bicycle lanes that provide exclusive use to bicycles on a roadway.

Cost Considerations

Capital and infrastructure costs for new bike facilities may be high. The local municipality may achieve cost savings through a reduction of cars on the road leading to lower infrastructure and roadway maintenance costs.

Expanded Mitigation Options

Implement alongside Measures T-22-A, T-22-B, and/or T-22-C to ensure that micromobility users can ride safely along bicycle lane facilities and not have to ride along pedestrian infrastructure, which is a risk to pedestrian safety.

GHG Reduction Formula

$$A = -B \times \frac{\frac{F}{I} \times (C + D) \times E \times G}{H}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from displaced vehicles on roadway parallel to bicycle facility	0–0.8	%	calculated
User Inputs				
B	Percent of plan/community VMT on parallel roadway	0–100	%	user input
C	Active transportation adjustment factor	Table T-19.1	unitless	CARB 2020
D	Credits for key destinations near project	Table T-19.2	unitless	CARB 2020
E	Growth factor adjustment for facility type	Table T-19.3	unitless	CARB 2020
Constants, Assumptions, and Available Defaults				
F	Annual days of use of new facility	Table T-19.4	days per year	NOAA 2017
G	Existing regional average one-way bicycle trip length	Table T-10.1	miles per trip	FHWA 2017
H	Existing regional average one-way vehicle trip length	Table T-10.1	miles per trip	FHWA 2017
I	Days per year	365	days per year	standard

Further explanation of key variables:

- (B) – The percent of total plan/community VMT within the roadway parallel to the bike facility should represent the expected total VMT generated by all land use in that area, including office, residences, retail, schools, and other uses. The most appropriate source for this data is from a local travel demand forecasting model. An alternate method uses VMT per worker or VMT per resident as calculated for SB 743 compliance and screening purposes multiplied by the population in the area.
- (C, D, and E) – The active transportation adjustment factor, key destination credit, and growth factor adjustment should be looked up by the user in Tables T-19.1 through T-19.3 in Appendix C. The active transport adjustment factor is based on the existing annual average daily traffic (AADT) of the facility, length of the proposed bike facility, and the city population. The key destination credit is based on the number of key destinations within 0.5-mile of the facility. The growth factor is based on the type of proposed bicycle facility.
- (F) – The annual days of use for the new facility should be looked up by users in Table T-19.4 based on the county in which the project is located. The days of use is based on the number of days per year where there is no rainfall (i.e., <=0.1 inches) (NOAA 2017).

- (G and H) – Ideally, the user will calculate bicycle and vehicle trip lengths for the corridor at a scale no larger than the surrounding census tract. Potential data sources include the U.S. Census, California Household Travel Survey (preferred), or local survey efforts. If the user is not able to provide a project-specific value using one of these data sources, they have the option to input regional average one-way bicycle and vehicle trip lengths for one of the six most populated CBSAs in California provided in Table T-10.1 in Appendix C (FHWA 2017).

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) For projects that use CBSA data from Table T-10.1 in Appendix C, the maximum percent reduction in GHG emissions (A) is 0.8 percent. This is based on a neighborhood project the size of a large corridor (B = 100%) within the CBSA of Sacramento-Roseville-Arden-Arcade that uses the highest values for (C, D, and E) in Tables T-19.1 through T-19.3 and annual use days for Sacramento County (F) in Table T-19.4. This maximum scenario is presented in the below example quantification.

(C_{max}) The active transportation adjustment factor (C) was determined for roadways with AADT ranging from 1 to 30,000 (CARB 2020). Roadways with AADT greater than 30,000 are generally not appropriate for bicycle facilities. Care should be taken by the user in interpreting the results from this equation for a project roadway with AADT greater than 30,000.

Subsector Maximum

($\sum A_{max_{T\text{-}18 \text{ through } T\text{-}22\text{-}C}} \leq 10\%$) This measure is in the Neighborhood Design subsector. This subcategory includes Measures T-18 through T-22-C. The VMT reduction from the combined implementation of all measures within this subsector is capped at 10 percent.

Example GHG Reduction Quantification

The user reduces VMT by constructing a bicycle facility that displaces vehicle trips with bicycle trips. In this example, the following assumptions are made to obtain inputs from Tables T-19.1 through T-19.3 in Appendix C:

- Percent of plan/community VMT on parallel roadway (B) = 100%. The project would establish a bike corridor the whole length of a central commercial thoroughfare. It is assumed this main street makes up the entire neighborhood.
- Active transportation adjustment factor (C) = 0.0207. Existing AADT on the roadway parallel to the proposed bicycle facility is 10,000, the facility length is 2.5 miles, and the project site is in a university town with a population of 200,000.
- Key destination credit (D) = 0.003. There are 10 key destinations within 0.25 mile of the project site.
- Growth factor adjustment (E) = 1.54. The bike facility would be a new Class IV bikeway.

The project is within the Sacramento-Roseville-Arden-Arcade CBSA and the user does not have project-specific values for average bicycle and vehicle trip lengths. Accordingly, the inputs of 2.9 miles and 10.9 miles, respectively (G and H), from Table T-10.1 in Appendix C are assumed. The user would displace GHG emissions from project study area VMT by 0.8 percent.

$$A = \textbf{-100\%} \times \left(\frac{\frac{307 \text{ days}}{365 \text{ days}} \times (\textbf{0.0207} + \textbf{0.003}) \times \textbf{1.54} \times 2.9 \text{ miles}}{10.9 \text{ miles}} \right) = -0.8\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A).

Improved Public Health

Users are directed to the ITHIM (CARB et al. 2020). The ITHIM can quantify the annual change in health outcomes associated with active transportation, including deaths, years of life lost, years of living with disability, and incidence of community and individual disease.

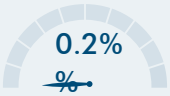
T-19-B. Construct or Improve Bike Boulevard

GHG Mitigation Potential



Up to 0.2% of GHG emissions from vehicles on roadway

Co-Benefits (icon key on pg. 34)

Climate Resilience

Constructing and improving bike boulevards can incentivize more bicycle use and decrease vehicle use, which have health benefits and can thus improve community resilience. This can also improve connectivity between residents and resources that may be needed in an extreme weather event.

Health and Equity Considerations

Prioritize low-income and underserved areas and communities with lower rates of vehicle ownership or fewer transit options. Make sure that the bicycle boulevard connects to a larger existing bikeway network that accesses destinations visited by low-income or underserved communities.

Measure Description

Construct or improve a single bicycle boulevard that connects to a larger existing bikeway network. Bicycle boulevards are a designation within Class III Bikeway that create safe, low-stress connections for people biking and walking on streets. This encourages a mode shift from vehicles to bicycles, displacing VMT and thus reducing GHG emissions. A variation of this measure is provided as T-19-A, *Construct or Improve Bike Facility*, which is for Class I, II, or IV bicycle infrastructure.

Subsector

Neighborhood Design

Locational Context

Urban, suburban

Scale of Application

Plan/Community. This measure reduces VMT on the roadway segment parallel to the bicycle facility (i.e., the corridor). An adjustment factor is included in the formula to scale the VMT reduction from the corridor level to the plan/community level.

Implementation Requirements

The following roadway conditions must be met.

- Functional classification: local and collector if there is no more than a single general-purpose travel lane in each direction.
- Design speed: <= 25 miles per hour.
- Design volume <= 5,000 average daily traffic.
- Treatments at major intersections: both directions have traffic signals (or an effective control device that prioritizes pedestrian and bicycle access such as rapid flashing beacons, pedestrian hybrid beacons, high-intensity activated crosswalks, TOUCANs), bike route signs, "sharrowed" roadway markings, and pedestrian crosswalks.

Cost Considerations

Capital and infrastructure costs for new bike boulevards may be high, though lower than implementing the same length of protected bicycle lanes (Class IV). After the bike boulevard is complete, the local municipality may achieve cost savings from reduced infrastructure and roadway maintenance costs.

Expanded Mitigation Options

Construct boulevards with forced turns for vehicles every few blocks to minimize through traffic while ensuring that speed and volume metrics are met. Implement alongside Measures T-22-A, T-22-B, and/or T-22-C to ensure that micromobility users can ride safely along bicycle lane facilities and not pedestrian infrastructure, which is a risk to pedestrian safety.

GHG Reduction Formula

$$A = B \times \frac{D \times (F - (C \times F))}{E \times G}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from displaced vehicles on roadway with bicycle boulevard	0–0.2	%	calculated
User Inputs				
B	Percent of plan/community VMT on roadway to have bicycle boulevard	0–100	%	user input
Constants, Assumptions, and Available Defaults				
C	Bike mode adjustment factor	1.14	unitless	Schwartz 2021
D	Existing bicycle trip length for all trips in region	Table T-10.1	miles	FHWA 2017a
E	Existing vehicle trip length for all trips in region	Table T-10.1	miles	FHWA 2017a
F	Existing bicycle mode share for work trips in region	Table T-10.2	%	FHWA 2017a
G	Existing vehicle mode share for work trips in region	Table T-10.2	%	FHWA 2017a

Further explanation of key variables:

- (C) – The bike mode adjustment factor is based on a database of before/after bicycle counts for 10 projects in four U.S. cities that invested in bicycle boulevards. Bicycle ridership increased on average by 114 percent (Schwartz 2021).
- (D and E) – Ideally, the user will calculate bicycle and vehicle trip lengths for the corridor at a scale no larger than the surrounding census tract. Potential data sources include the U.S. Census, California Household Travel Survey (preferred), or local survey efforts. If the user is not able to provide a project-specific value using one of these data sources, they have the option to input regional average one-way bicycle and vehicle trip lengths for one of the six most populated CBSAs in California provided in Table T-10.1 in Appendix C (FHWA 2017a).
- (F and G) – Ideally, the user will calculate bicycle and auto mode share for work trips for a Project/Site at a scale no larger than a census tract. Potential data sources include the U.S. Census, California Household Travel Survey (preferred), or local survey efforts. If the user is not able to provide a project-specific value using one of these data sources, they have the option to input the regional average mode shares for bicycle and vehicle work trips for one of the six most populated CBSAs in California, as presented in Table T-10.2 in Appendix C (FHWA 2017b). If the project study area is not within the listed

CBSAs or the user is able to provide a project-specific value, the user should replace these regional defaults in the GHG reduction formula. For areas not covered by the listed CBSAs, which represent the denser areas of the state, bicycle mode share is likely to be lower and vehicle share higher than presented in Table T-10.2.

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) For projects that use CBSA data from Tables T-10.1 and T-10.2 in Appendix C, the maximum percent reduction in GHG emissions (A) is 0.2 percent. This is based on a neighborhood project the size of a large corridor (B = 100%) within the CBSA of San Jose-Sunnyvale-Santa Clara that uses the highest values for (C, D, and E) in Tables T-19.1 through T-19.3 and annual use days for Sacramento County (F) in Table T-19.4. This maximum scenario is presented in the below example quantification.

Subsector Maximum

($\sum A_{max_{T\text{-}18 \text{ through } T\text{-}22\text{-}C}} \leq 10\%$) This measure is in the Neighborhood Design subsector. This subcategory includes Measures T-18 through T-22-C. The VMT reduction from the combined implementation of all measures within this subsector is capped at 10 percent.

Example GHG Reduction Quantification

The user reduces VMT by providing a bicycle boulevard on the targeted roadway, which encourages bicycle trips in place of vehicle trips. In this example, it is assumed this main street makes up the entire plan area, i.e., (B) is 100 percent. The project is within San Jose-Sunnyvale-Santa Clara CBSA and the user does not have project-specific values for trip lengths and mode shares for bicycles and vehicles. Per Tables T-10.1 and T-10.2, inputs for these variables are 2.8 miles, 11.5 miles, 4.1 percent, and 86.6 percent, respectively (D, E, F, and G). GHG emissions from plan/community VMT would be reduced by 0.2 percent.

$$A = 100\% \times \frac{2.8 \text{ miles} \times \left(4.1\% - (1.14 \times 4.1\%)\right)}{11.5 \text{ miles} \times 86.6\%} = -0.2\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A).

Improved Public Health

Users are directed to the ITHIM (CARB et al. 2020). The ITHIM can quantify the annual change in health outcomes associated with active transportation, including deaths, years of life lost, years of living with disability, and incidence of community and individual disease.

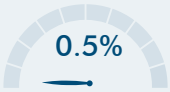
T-20. Expand Bikeway Network

GHG Mitigation Potential



Up to 0.5% of GHG emissions from vehicle travel in the plan/community

Co-Benefits (icon key on pg. 34)

Climate Resilience

Expanding bikeway networks can incentivize more bicycle use and decrease vehicle use, which have health benefits and can thus improve community resilience. This can also improve connectivity between residents and resources that may be needed in an extreme weather event.

Health and Equity Considerations

Prioritize low-income and underserved areas and communities with lower rates of vehicle ownership or fewer transit options. Make sure that destinations visited by low-income or underserved communities are served by the network.

Measure Description

This measure will increase the length of a city or community bikeway network. A bicycle network is an interconnected system of bike lanes, bike paths, bike routes, and cycle tracks. Providing bicycle infrastructure with markings and signage on appropriately sized roads with vehicle traffic traveling at safe speeds helps to improve biking conditions (e.g., safety and convenience). In addition, expanded bikeway networks can increase access to and from transit hubs, thereby expanding the "catchment area" of the transit stop or station and increasing ridership. This encourages a mode shift from vehicles to bicycles, displacing VMT and thus reducing GHG emissions. When expanding a bicycle network, a best practice is to consider bike lane width standards from local agencies, state agencies, or the National Association of City Transportation Officials' *Urban Bikeway Design Guide*.

Subsector

Neighborhood Design

Locational Context

Urban, suburban

Scale of Application

Plan/Community

Implementation Requirements

The bikeway network must consist of either Class I, II, or IV infrastructure.

Cost Considerations

Capital and infrastructure costs for expanding the bikeway network may be high. Construction of these facilities may also increase vehicle traffic, leading to more congestion and temporarily longer trip times for motorist. However, the local municipality may achieve cost savings through a reduction of cars on the road leading to lower infrastructure and roadway maintenance costs.

Expanded Mitigation Options

As networks expand, ensure safe, secure, and weather-protected bicycle parking facilities at origins and destinations. Also, implement alongside T-22-A, T-22-B, and/or T-22-C to ensure that micromobility options can ride safely along bicycle lane facilities and not have to ride along pedestrian infrastructure, which is a risk to pedestrian safety.

GHG Reduction Formula

$$A = -1 \times \frac{\left(\frac{C - B}{B}\right) \times D \times F \times H}{E \times G}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from employee commute vehicle travel in plan/community	0–0.5	%	calculated
User Inputs				
B	Existing bikeway miles in plan/community	[ ]	miles	user input
C	Bikeway miles in plan/community with measure	[ ]	miles	user input
Constants, Assumptions, and Available Defaults				
D	Bicycle mode share in plan/community	Table T-20.1	%	FHWA 2017
E	Vehicle mode share in plan/community	Table T-3.1	%	FHWA 2017
F	Average one-way bicycle trip length in plan/community	Table T-10.1	miles per trip	FHWA 2017
G	Average one-way vehicle trip length in plan/community	Table T-10.1	miles per trip	FHWA 2017
H	Elasticity of bike commuters with respect to bikeway miles per 10,000 population	0.25	unitless	Pucher & Buehler 2011

Further explanation of key variables:

- (B) – The existing bikeway miles in a plan/community should be calculated by measuring the distance of all Class I, II, III, and IV bikeways within the plan/community. This information can sometimes be found in a city's bicycle master plan, if a plan has been prepared and is up to date.
- (D, E, F, and G) – Ideally, the user will calculate bicycle and auto mode share and trip length for a plan/community at the city scale. Potential data sources include the California Household Travel Survey (preferred) or local survey efforts. If the user is not able to provide a project-specific value using one of these data sources, they have the option to input the mode shares and trip lengths for bicycles and vehicles for one of the six most populated CBSAs in California, as presented in Table T-3.1, T-10.2, and T-20.1 in Appendix C. Trip lengths are likely to be longer for areas not covered by the listed CBSAs, which represent the denser areas of the state. Similarly, it is likely for areas outside of the area covered by the listed CBSAs to have vehicle mode shares higher and bicycle mode shares lower than the values provided in the tables.
- (H) – A multivariate analysis of the impacts of bike lanes on cycling levels in the 100 largest U.S. cities found that a 0.25 percent increase in commute cycling occurs for every 1 percent increase in bike lane distance (Pucher & Buehler 2011).

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) For projects that use CBSA data from Tables T-3.1, T-10.2, and T-20.1 in Appendix C, the maximum percent reduction in GHG emissions (A) is 0.5 percent. This is based on a project within the CBSA of San Jose-Sunnyvale-Santa Clara that has no existing bike lane infrastructure. This maximum scenario is presented in the below example quantification.

($\frac{C-B}{B}_{max}$) The maximum percent increase in bike lane miles in the plan/community is conservatively capped at 1000 percent. If there is no existing bike lane infrastructure in the plan/community, (B) should be set to (1/11×C), resulting in a percentage change of 1000 percent.

Subsector Maximum

($\sum A_{max_{T\text{-}18 \text{ through } T\text{-}22\text{-}C}} \leq 10\%$) This measure is in the Neighborhood Design subsector. This subcategory includes Measures T-18 through T-22-C. The VMT reduction from the combined implementation of all measures within this subsector is capped at 10 percent.

Example GHG Reduction Quantification

The user reduces employee commute VMT by increasing the length of a bicycle network within a plan/community, which displaces commute vehicle trips with bicycle trips. In this example, the existing bikeway length in the plan/community (B) is 0 miles and the length with the measure (C) is 11 miles. The project is within the San Jose-Sunnyvale-Santa Clara CBSA, yielding the following inputs from Tables T-3.1, T-10.2, and T-20.1 in Appendix C.

- Bicycle mode share (D) = 0.79 percent.
- Vehicle mode share (E) = 91.32 percent.
- Average one-way bicycle trip length (F) = 2.8 miles.
- Average one-way vehicle trip length (G) = 11.5 miles.

The user would displace GHG emissions from project study area employee commute VMT by 0.5 percent.

$$A = -1 \times \left(\frac{(1000\%) \times 0.79\% \times 2.8 \text{ miles} \times 0.25}{91.32\% \times 11.5 \text{ miles}} \right) = -0.5\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an

adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in employee commute VMT would be the same as the percent reduction in GHG emissions (A).

Improved Public Health

Users are directed to the ITHIM (CARB et al. 2020). The ITHIM can quantify the annual change in health outcomes associated with active transportation, including deaths, years of life lost, years of living with disability, and incidence of community and individual disease.

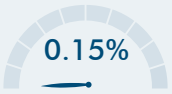
T-21-A. Implement Conventional Carshare Program

GHG Mitigation Potential



Up to 0.15% of GHG emissions from vehicle travel in the plan/community

Co-Benefits (icon key on pg. 34)

Climate Resilience

Carshare programs can increase accessibility and provide redundancy to vehicles that can be used to evacuate or obtain resources during an extreme weather event. Carshare programs can allow residents to give up or avoid car ownership, leading to cost savings that can help build economic resilience.

Health and Equity Considerations

Provide inclusive mechanisms so people without bank accounts, credit cards, or smart phones can access the system.

Measure Description

This measure will increase carshare access in the user's community by deploying conventional carshare vehicles. Carsharing offers people convenient access to a vehicle for personal or commuting purposes. This helps encourage transportation alternatives and reduces vehicle ownership, thereby avoiding VMT and associated GHG emissions. A variation of this measure, electric carsharing, is described in Measure T-21-B, *Implement Electric Carshare Program*.

Subsector

Neighborhood Design

Locational Context

Urban, suburban

Scale of Application

Plan/Community

Implementation Requirements

The GHG mitigation potential is based, in part, on literature analyzing one-way carsharing service with a free-floating operational model. This measure should be applied with caution if using a different form of carsharing (e.g., roundtrip, peer-to-peer, fractional).

Cost Considerations

The costs incurred by the carshare program service manager (typically a municipality or carshare company) may include the capital costs of purchasing vehicles; costs of storing, maintaining, and replacing the fleet; and costs for marketing and administration. Some of these costs may be offset by income generated through program use.

Expanded Mitigation Options

When implementing a carshare program, best practice is to discount carshare membership and provide priority parking for carshare vehicles to encourage use of the service.

GHG Reduction Formula

$$A = \frac{B \times (E - D)}{C}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from vehicle travel in plan/community	0–0.15	%	calculated
User Inputs				
B	Number of vehicles deployed in plan/community	[ ]	integer	user input
C	VMT in plan/community without measure	[ ]	VMT per day	user input
Constants, Assumptions, and Available Defaults				
D	Conventional VMT avoided with measure	68.2	VMT per day per vehicle	Martin and Shaheen 2016
E	Conventional VMT added with measure	24.4	VMT per day per vehicle	Martin and Shaheen 2016

Further explanation of key variables:

- (B) – The number of cars in the carshare program is selected by the carshare provider, but its magnitude is relative to the size of the service area. A study of several carsharing programs (Martin and Shaheen 2016) documented a range of carshare fleet sizes for different North American cities: Calgary (590), San Diego (406), Seattle (640), Vancouver (920), Washington, D.C. (626).
- (C) – The total plan/community VMT should represent the expected total VMT generated by all land use in that area. The most appropriate source for this data is from a local travel demand model.
- (D) – Conventional VMT avoided per deployed carshare vehicle was derived based on a study of conventional-engine based car share programs in Calgary, Seattle, Vancouver, and Washington, D.C. It accounts for VMT avoided from carshare users who sold their personal vehicles and carshare users who decided not to purchase a personal vehicle, both directly because of the availability of carshare (Martin and Shaheen 2016).
- (E) – Conventional VMT added per deployed carshare vehicle was derived based on a study of conventional-engine based car share programs in Calgary, Seattle, Vancouver, and Washington, D.C. It accounts for the VMT of the carshare vehicles (Martin and Shaheen 2016).

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The maximum GHG reduction from this measure is 0.15 percent. This maximum scenario is presented in the below example quantification.

Subsector Maximum

($\sum A_{max_{T\text{-}18 \text{ through } T\text{-}22\text{-}C}} \leq 10\%$) This measure is in the Neighborhood Design subsector. This subcategory includes Measures T-18 through T-22-C. The VMT reduction from the combined implementation of all measures within this subsector is capped at 10 percent.

Example GHG Reduction Quantification

The user reduces plan/community VMT by deploying carshare vehicles. In this example, the project would be in the city of San Diego, which in 2017 had a VMT per day of 24,101,089 miles (C) (SANDAG 2019). Assuming twice the number of vehicles used in the Car2go San Diego program (B), the GHG emissions from plan/community VMT would be reduced by 0.15 percent.

$$A = \frac{812 \text{ vehicles} \times (24.4 \frac{\text{VMT}}{\text{day·vehicle}} - 68.2 \frac{\text{VMT}}{\text{day·vehicle}})}{24{,}101{,}089 \frac{\text{VMT}}{\text{day}}} = -0.15\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A).

T-21-B. Implement Electric Carshare Program

GHG Mitigation Potential

Up to 0.18% of GHG emissions from vehicle travel in the plan/community

Co-Benefits (icon key on pg. 34)

Climate Resilience

Electric carshare programs can increase accessibility and provide redundancy to vehicles that can be used to evacuate or obtain resources during an extreme weather event. Electric vehicles also provide fuel redundancy by allowing an alternative fuel source if an extreme event disrupts other fuel sources; however, they may decrease resilience if they are the only option available during a power outage.

Health and Equity Considerations

Provide inclusive mechanisms so people without bank accounts, credit cards, or smart phones can access the system.

Measure Description

This measure will increase carshare access in the user's community by deploying electric carshare vehicles. Carsharing offers people convenient access to a vehicle for personal or commuting purposes. This helps encourage transportation alternatives and reduces vehicle ownership, thereby avoiding VMT and associated GHG emissions. This also encourages a mode shift from internal combustion engine vehicles to electric vehicles, displacing the emissions-intensive fossil fuel energy with less emissions-intensive electricity. Electric carshare vehicles require more staffing support compared to conventional carshare programs for shuttling electric vehicles to and from charging points. A variation of this measure, conventional carsharing, is described in Measure T-21-A, *Implement Conventional Carshare Program*.

Subsector

Neighborhood Design

Locational Context

Urban, suburban

Scale of Application

Plan/Community

Implementation Requirements

The GHG mitigation potential is based, in part, on literature analyzing one-way carsharing service with a free-floating operational model. This measure should be applied with caution if using a different form of carsharing (e.g., roundtrip, peer-to-peer, fractional).

Cost Considerations

Costs incurred by the service manager (e.g., municipality, carshare company) may include the capital costs of purchasing vehicles; costs of storing, maintaining, and replacing the fleet; and costs for marketing and administration. Some of these costs may be offset by income generated through program use. Participants' recurring costs of renting a carshare vehicle may be offset by the cost savings from access to cheaper transportation.

Expanded Mitigation Options

When implementing a carshare program, best practice is to discount carshare membership and provide priority parking for carshare vehicles to encourage use of the service.

GHG Reduction Formula

$$A = -1 \times \frac{B \times ((E \times G \times H \times I \times J) - (D \times F))}{C \times F}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from vehicle travel in plan/community	0–0.18	%	calculated
User Inputs				
B	Number of electric vehicles deployed in plan/community	[ ]	integer	user input
C	VMT in plan/community without measure	[ ]	VMT per day	user input
Constants, Assumptions, and Available Defaults				
D	Conventional VMT avoided with measure	54.8	VMT per day per EV	Martin and Shaheen 2016
E	Electric VMT added with measure	13.7	VMT per day per EV	Martin and Shaheen 2016
F	Emission factor of non-electric light duty fleet mix	307.5	g CO_2e per mile	CARB 2020a
G	Energy efficiency of carshare electric vehicle	0.327	kWh per mile	CARB 2020b; U.S. DOE 2021
H	Carbon intensity of local electricity provider	Tables E-4.3 and E-4.4	lb CO_2e per MWh	CA Utilities 2021
I	Conversion from lb to g	454	g per lb	conversion
J	Conversion from kWh to MWh	0.001	MWh per kWh	conversion

Further explanation of key variables:

- (B) – The number of cars in the carshare program is selected by the carshare provider, but its magnitude is relative to the size of the service area. A study of several carsharing programs (Martin and Shaheen 2016) documented a range of carshare fleet sizes for different North American cities: Calgary (590), San Diego (406), Seattle (640), Vancouver (920), Washington, D.C. (626).
- (C) – The total plan/community VMT should represent the expected total VMT generated by all land use in that area. The most appropriate source for this data is from a local travel demand forecasting model.
- (D) – Conventional VMT avoided per deployed carshare vehicle was derived based on a study of an electric vehicle carshare program in San Diego. It accounts for VMT avoided from carshare users who sold their personal vehicles and carshare users who decided not to purchase a personal vehicle, both directly because of the availability of carshare (Martin and Shaheen 2016).

- (E) – Electric VMT added per deployed carshare vehicle was derived based on a study of an electric vehicle carshare program in San Diego. It accounts for the VMT of the carshare vehicles and includes staff-driven VMT needed to bring the vehicles to charging points (Martin and Shaheen 2016).
- (F) – The average GHG emission factor for non-electric vehicles was calculated in terms of CO_2e per mile using EMFAC2017 (v1.0.3). The model was run for a 2020 statewide average of LDA, LDT1, and LDT2 vehicles using diesel and gasoline fuel. The running emission factors for CO_2, CH_4, and N_2O (CARB 2020a) were multiplied by the corresponding 100-year GWP values from the IPCC's Fourth Assessment Report (IPCC 2007). If the user can provide a project-specific value (i.e., for a future year and project location), the user should run EMFAC to replace the default in the GHG reduction formula.
- (G) – Scaled from light-duty automobile gasoline equivalent fuel economy (G from Measure T-14) based on energy efficiency ratio (EER) of 2.5 (CARB 2020b) and an assumption of 33.7 kWh electricity per gallon of gasoline (U.S. DOE 2021).
- (H) – GHG intensity factors for major California electricity providers are provided in Tables E-4.3 and E-4.4 in Appendix C. If the project study area is not serviced by a listed electricity provider, or the user is able to provide a project-specific value (i.e., for the future year not referenced in Appendix C), the user should replace the default in the GHG calculation formula. If the electricity provider is not known, the user may elect to use the statewide grid average carbon intensity.

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The maximum GHG reduction from this measure is 0.18 percent. This maximum scenario is presented in the below example quantification.

Subsector Maximum

($\sum A_{max_{\text{T-18 through T-22-C}}} \leq 10\%$) This measure is in the Neighborhood Design subsector. This subcategory includes Measures T-18 through T-22-C. The VMT reduction from the combined implementation of all measures within this subsector is capped at 10 percent.

Example GHG Reduction Quantification

The user reduces plan/community VMT by deploying carshare vehicles. In this example, the project would be in the city of San Diego, which in 2017 had a VMT per day of 24,101,089 miles (C) (SANDAG 2019). Assuming twice the number of vehicles used in the Car2go San Diego program (B), and a commitment by the carshare service provider to purchase zero-carbon electricity for all carshare charging stations (H), the GHG emissions from plan/community VMT would be reduced by 0.18 percent.

$$A = -1 \times \frac{\mathbf{812} \times \left(\left(13.7 \frac{\text{eVMT}}{\text{day·vehicle}} \times 0.327 \frac{\text{kWh}}{\text{mile}} \times 0 \frac{\text{lb } CO_2e}{\text{MWh}} \times 454 \frac{\text{g}}{\text{lb}} \times 0.001 \frac{\text{MWh}}{\text{kWh}}\right) - \left(54.8 \frac{\text{cVMT}}{\text{day·vehicle}} \times 307.5 \frac{\text{g } CO_2e}{\text{mile}}\right)\right)}{\mathbf{24{,}101{,}089} \frac{\mathbf{VMT}}{\mathbf{day}} \times 307.5 \frac{\text{g } CO_2e}{\text{mile}}} = -0.18\%$$

Quantified Co-Benefits

Improved Local Air Quality

Local criteria pollutants will be reduced by the reduction in vehicle fuel consumption. Electricity supplied by statewide fossil-fueled or bioenergy power plants will generate criteria pollutants. However, because these power plants are located throughout the state, electricity consumption from electric vehicles will not generate localized criteria pollutant emissions. Accordingly, the percent reduction in NO_X, CO, NO_2, SO_2, and PM (K) is calculated using a simplified version of the GHG reduction formula, as follows:

$$K = -1 \times \frac{B \times -D}{C}$$

Reductions in ROG emissions can be calculated by multiplying the percent reduction in other criteria pollutant emissions (K) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Fuel Savings (Increased Electricity)

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in criteria pollutant emissions (K). The percent increase in electricity use (L) from this measure can be calculated using a variation of the GHG reduction formula, as follows.

Electricity Use Increase Formula

$$L = \frac{B \times E \times G \times N}{M}$$

Electricity Use Increase Calculation Variables

ID	Variable	Value	Unit	Source
Output				
L	Increase in electricity from electric vehicles	[ ]	%	calculated
User Inputs				
M	Existing electricity consumption of plan/community	[ ]	kWh per year	user input
Constants, Assumptions, and Available Defaults				
N	Days per year carshare program operational	365	days per year	assumed

Further explanation of key variables:

- (M) – The user should take care to properly quantify building electricity using accepted methodologies (such as CalEEMod).
- Please refer to the GHG Calculation Variables table above for definitions of variables that have been previously defined.

VMT Reductions

The percent reduction in VMT (O) is calculated using a simplified version of the GHG reduction formula that excludes the variables related to emission factors, as follows.

$$O = -1 \times \frac{B \times (E - D)}{C}$$

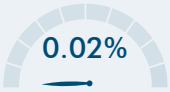
T-22-A. Implement Pedal (Non-Electric) Bikeshare Program

GHG Mitigation Potential



Up to 0.02% of GHG emissions from vehicle travel in the plan/community

Co-Benefits (icon key on pg. 34)

Climate Resilience

Bikeshare programs can incentivize more bicycle use and decrease vehicle use, which have health benefits and can thus improve community resilience. This can also improve connectivity between residents and resources that may be needed in an extreme weather event.

Health and Equity Considerations

Provide inclusive mechanisms so people without bank accounts, credit cards, or smart phones can access the system.

Measure Description

This measure will establish a bikeshare program. Bikeshare programs provide users with on-demand access to bikes for short-term rentals. This encourages a mode shift from vehicles to bicycles, displacing VMT and thus reducing GHG emissions. Variations of this measure are described in Measure T-22-B, *Implement Electric Bikeshare Program*, and Measure T-22-C, *Implement Scootershare Program*.

Subsector

Neighborhood Design

Locational Context

Urban, suburban

Scale of Application

Plan/Community

Implementation Requirements

The GHG mitigation potential is based, in part, on literature analyzing docked (i.e., station-based) bikeshare programs. This measure should be applied with caution if using dockless (free-floating) bikeshare.

Cost Considerations

The costs incurred by the service manager (e.g., municipality or bikeshare company) may include the capital costs for purchasing a bicycle fleet; installing accessible and secure docking stations; storing, maintaining, and replacing the fleet; and marketing and administration. Some of these costs may be offset by income generated through program use. Program participants will benefit from the cost savings from access to cheaper transportation alternatives (compared to private vehicles, private bicycles, or use of ride-hailing services). The local municipality may achieve cost savings through a reduction of cars on the road leading to lower infrastructure and roadway maintenance costs.

Expanded Mitigation Options

Best practice is to discount bikeshare membership and dedicate bikeshare parking to encourage use of the service. Also consider including space on the vehicle to store personal items while traveling, such as a basket.

GHG Reduction Formula

This measure methodology does not account for the direct GHG emissions from vehicle travel of program employees picking up and dropping off bikes.

$$A = -1 \times \frac{(C - B) \times D \times E \times F}{G \times H}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from vehicle travel in plan/community	0–0.02	%	calculated
User Inputs				
B	Percent of residences in plan/community with access to bikeshare system without measure	0–100	%	user input
C	Percent of residences in plan/community with access to bikeshare system with measure	0–100	%	user input
Constants, Assumptions, and Available Defaults				
D	Daily bikeshare trips per person	0.021	trips per day per person	MTC 2017
E	Vehicle to bikeshare substitution rate	19.6	%	McQueen et al. 2020
F	Bikeshare average one-way trip length	1.4	miles per trip	Lazarus et al. 2019
G	Daily vehicle trips per person	2.7	trips per day per person	FHWA 2018
H	Regional average one-way vehicle trip length	Table T-10.1	miles per trip	FHWA 2017

Further explanation of key variables:

- (B and C) – Access to bikesharing is measured as the percent of residences in the plan/community within 0.25 mile of a bikeshare station. For dockless bikes, assume that all residences within 0.25 mile of the designated dockless service area would have access.
- (D) – An analysis of bike share service areas in the San Francisco Bay Area estimated that in locations with access to bikesharing, there were between 21 and 25 bikeshare trips per day per 1,000 residents (MTC 2017). To be conservative, the low end of this range is cited.
- (E) – A literature review of several academic and government reports found that the average car trip substitution rate by bikeshare trips was 19.6 percent. This included bikeshare programs in Washington D.C., Minneapolis, and Montreal (McQueen et al. 2020).

- (F) – A case study on average trip lengths for pedal and electric bikeshare programs in San Francisco reported a one-way pedal bikeshare trip of 1.4 miles (Lazarus et al. 2019).
- (G) – A summary report of the 2017 National Household Travel Survey data found that the average person in the U.S. takes 2.7 vehicle trips per day (FHWA 2018).
- (H) – Ideally, the user will calculate auto trip length for a plan/community at a scale no larger than a census tract. Potential data sources include the U.S. Census, California Household Travel Survey (preferred), or local survey efforts. If the user is not able to provide a plan-specific value using one of these data sources, they have the option to input the existing regional average one-way auto trip length for one of the six most populated CBSAs in California, as presented in Table T-10.1 in Appendix C (FHWA 2017). Trip lengths are likely to be longer for areas not covered by the listed CBSAs, which represent the denser areas of the state.

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) For projects that use default CBSA data from Table T-10.1, the maximum percent reduction in GHG emissions (A) is 0.02 percent. This maximum scenario is presented in the below example quantification.

Subsector Maximum

($\sum A_{max_{T\text{-}18 \text{ through } T\text{-}22\text{-}C}} \leq 10\%$) This measure is in the Neighborhood Design subsector. This subcategory includes Measures T-18 through T-22-C. The VMT reduction from the combined implementation of all measures within this subsector is capped at 10 percent.

Example GHG Reduction Quantification

The user reduces plan/community VMT by deploying bikesharing throughout the area. In this example, the project is in the Los Angeles-Long Beach-Anaheim CBSA, and the one-way vehicle trip length would be 9.72 miles (H). Assuming 100 percent of residents in the plan/community would have bikeshare access (C) where there was no existing access (B), the user would reduce GHG emissions from plan/community VMT by 0.02 percent.

$$A = -1 \times \frac{(100\% - 0\%) \times 0.021 \frac{\text{trips}}{\text{day·person}} \times 19.6\% \times 1.4 \frac{\text{miles}}{\text{trip}}}{2.7 \frac{\text{trips}}{\text{day·person}} \times 9.72 \frac{\text{miles}}{\text{trip}}} = -0.02\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an

adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A).

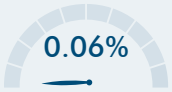
T-22-B. Implement Electric Bikeshare Program

GHG Mitigation Potential



Up to 0.06% of GHG emissions vehicle travel in the plan/community

Co-Benefits (icon key on pg. 34)

Climate Resilience

Bikeshare programs can incentivize more bicycle use and decrease vehicle use, which have health benefits and can thus improve community resilience. This can also improve connectivity between residents and resources that may be needed in an extreme weather event. However, they may decrease resilience if they are the only option available during a power outage.

Health and Equity Considerations

Provide inclusive mechanisms so people without bank accounts, credit cards, or smart phones can access the system.

Measure Description

This measure will establish an electric bikeshare program. Electric bikeshare programs provide users with on-demand access to electric pedal assist bikes for short-term rentals. This encourages a mode shift from vehicles to electric bicycles, displacing VMT and reducing GHG emissions. Variations of this measure are described in Measure T-22-A, *Implement Pedal (Non-Electric) Bikeshare Program*, and Measure T-22-C, *Implement Scootershare Program*.

Subsector

Neighborhood Design

Locational Context

Urban, suburban

Scale of Application

Plan/Community

Implementation Requirements

The GHG mitigation potential is based, in part, on literature analyzing docked (i.e., station-based) bikeshare programs. This measure should be applied with caution if using dockless (free-floating) bikeshare.

Cost Considerations

The costs incurred by the service manager (e.g., municipality or bikeshare company) may include the capital costs for purchasing a bicycle fleet; installing accessible and secure charging stations; storing, maintaining, and replacing the fleet; and marketing and administration. Some of these costs may be offset by income generated through program use. Program participants will benefit from the cost savings from access to cheaper transportation alternatives (compared to private vehicles, private bicycles, or use of ride-hailing services). The local municipality may achieve cost savings through a reduction of cars on the road leading to lower infrastructure and roadway maintenance costs.

Expanded Mitigation Options

Best practice is to discount electric bikeshare membership and dedicate electric bikeshare parking to encourage use of the service. Consider also including space on the vehicle to store personal items while traveling, such as a basket.

GHG Reduction Formula

The quantification methodology does not account for indirect GHG emissions from electricity used to charge the bicycles or direct GHG emissions from vehicle travel of program employees picking up and dropping off bikes.

$$A = -1 \times \frac{(C - B) \times D \times E \times F}{G \times H}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from vehicle travel in plan/community	0–0.06	%	calculated
User Inputs				
B	Percent of residences in plan/community with access to electric bikeshare system without measure	0–100	%	user input
C	Percent of residences in plan/community with access to electric bikeshare system with measure	0–100	%	user input
Constants, Assumptions, and Available Defaults				
D	Daily electric bikeshare trips per person	0.021	trips per day per person	MTC 2017
E	Vehicle to electric bikeshare substitution rate	35	percent	Fitch et al. 2021
F	Electric bikeshare average one-way trip length	2.1	miles per trip	Fitch et al. 2021
G	Daily vehicle trips per person	2.7	trips per day per person	FHWA 2018
H	Regional average one-way vehicle trip length	Table T-10.1	miles per trip	FHWA 2017

Further explanation of key variables:

- (B and C) – Access to electric bikesharing is measured as the percent of residences in the plan/community within 0.25-mile of an electric bikeshare station. For dockless bikes, assume that all residences within 0.25 mile of the designated dockless service area would have access.
- (D) – An analysis of bike share service areas in the San Francisco Bay Area estimated that in locations with access to bikesharing, there were between 21 and 25 bikeshare trips per day per 1,000 residents (MTC 2017). To be conservative, the low end of this range is cited. Conventional bikeshare trip rate data was used due to lack of specific data for electric bikeshare.
- (E) – A study of dockless electric bike share in Sacramento found that the substitution rate of vehicles trips by electric bikeshare trips was 35 percent (Fitch et al. 2021).

- (F) – A study of dockless electric bike share in Sacramento found that the average one-way bikeshare trip was 2.1 miles (Fitch et al. 2021).
- (G) – A summary report of the 2017 National Household Travel Survey data found that the average person in the U.S. takes 2.7 vehicle trips per day (FHWA 2018).
- (H) – Ideally, the user will calculate auto trip length for a plan/community at a scale no larger than a census tract. Potential data sources include the U.S. Census, California Household Travel Survey (preferred), or local survey efforts. If the user is not able to provide a plan-specific value using one of these data sources, they have the option to input the existing regional average one-way auto trip length for one of the six most populated CBSAs in California, as presented in Table T-10.1 in Appendix C (FHWA 2017). Trip lengths are likely to be longer for areas not covered by the listed CBSAs, which represent the denser areas of the state.

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) For projects that use default CBSA data from Table T-10.1, the maximum percent reduction in GHG emissions (A) is 0.06 percent. This maximum scenario is presented in the below example quantification.

Subsector Maximum

($\sum A_{max_{T\text{-}18 \text{ through } T\text{-}22\text{-}C}} \leq 10\%$) This measure is in the Neighborhood Design subsector. This subcategory includes Measures T-18 through T-22-C. The VMT reduction from the combined implementation of all measures within this subsector is capped at 10 percent.

Example GHG Reduction Quantification

The user reduces plan/community VMT by deploying electric bikesharing throughout the area. In this example, the project is in the Los Angeles-Long Beach-Anaheim CBSA, and the one-way vehicle trip length would be 9.72 miles (H). Assuming 100 percent of residents in the plan/community would have bikeshare access (C) where there was no existing access (B), the user would reduce GHG emissions from plan/community VMT by 0.06 percent.

$$A = -1 \times \frac{(100\% - 0\%) \times 0.021 \frac{\text{trips}}{\text{day·person}} \times 35\% \times 2.1 \frac{\text{miles}}{\text{trip}}}{2.7 \frac{\text{trips}}{\text{day·person}} \times 9.72 \frac{\text{miles}}{\text{trip}}} = -0.06\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an

adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A). This quantification methodology does not account for the increase in electricity used to charge the vehicles or the fuel consumption from vehicle travel of program employees picking up and dropping off bikes.

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A). This quantification methodology does not account for the miles traveled from vehicle travel of program employees picking up and dropping off bikes.

T-22-C. Implement Scootershare Program

GHG Mitigation Potential

Up to 0.07% of GHG emissions from vehicle travel in the plan/community

Co-Benefits (icon key on pg. 34)

Climate Resilience

Scootershare programs can incentivize more scooter use and decrease vehicle use, which have health benefits and can thus improve community resilience. This can also improve connectivity between residents and resources that may be needed in an extreme weather event.

Health and Equity Considerations

Provide inclusive mechanisms so people without bank accounts, credit cards, or smart phones can access the system.

Measure Description

This measure will establish a scootershare program. Scootershare programs provide users with on-demand access to electric scooters for short-term rentals. This encourages a mode shift from vehicles to scooters, displacing VMT and thus reducing GHG emissions. Variations of this measure are described in Measure T-22-A, *Implement Pedal (Non-Electric) Bikeshare Program*, and Measure T-22-B, *Implement Electric Bikeshare Program*.

Subsector

Neighborhood Design

Locational Context

Urban, suburban

Scale of Application

Plan/Community

Implementation Requirements

The GHG mitigation potential is based, in part, on literature analyzing docked (i.e., station-based) bikeshare programs. This measure should be applied with caution given the likely higher popularity of scootershare compared to bikeshare.

Cost Considerations

The costs incurred by the service manager (e.g., municipality or scootershare company) may include the capital costs for purchasing a scooter fleet; installing accessible and secure docking stations; storing, maintaining, and replacing the fleet; and marketing and administration. Some of these costs may be offset by income generated through program use. Program participants will benefit from cost savings from access to cheaper transportation alternatives (compared to private vehicles, private scooters, or use of ride-hailing services). The local municipality may achieve cost savings through a reduction of cars on the road leading to lower infrastructure and roadway maintenance costs.

Expanded Mitigation Options

Best practice is to discount scootershare membership and dedicate scootershare parking to encourage use of the service. Consider also including space on the vehicle to store personal items while traveling, such as a basket.

GHG Reduction Formula

This measure methodology does not account for the indirect GHG emissions from electricity used to charge the scooters or direct GHG emissions from vehicle travel of program employees picking up and dropping off scooters.

$$A = -1 \times \frac{(C - B) \times D \times E \times F}{G \times H}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from vehicle travel in plan/community	0–0.07	%	calculated
User Inputs				
B	Percent of residences in plan/community with access to scootershare system without measure	0–100	%	user input
C	Percent of residences in plan/community with access to scootershare system with measure	0–100	%	user input
Constants, Assumptions, and Available Defaults				
D	Daily scootershare trips per person	0.021	trips per day per person	MTC 2017
E	Vehicle to scootershare substitution rate	38.5	%	McQueen et al. 2020
F	Scootershare average one-way trip length	2.14	miles per trip	PBOT 2021
G	Daily vehicle trips per person	2.7	trips per day per person	FHWA 2018
H	Regional average one-way vehicle trip length	Table T-10.1	miles per trip	FHWA 2017

Further explanation of key variables:

- (B and C) – Access to scootersharing is measured as the percent of residences in the plan/community within 0.25-mile of a scootershare station. For dockless scooters, assume that all residences within 0.25-mile of the designated dockless service area would have access.
- (D) – An analysis of bike share service areas in the San Francisco Bay Area estimated that in locations with access to bikesharing, there were between 21 and 25 bikeshare trips per day per 1,000 residents (MTC 2017). To be conservative, the low end of this range is cited. Conventional bikeshare trip rate data was used due to lack of specific data for scootershare.
- (E) – A literature review of several academic and government reports found that the average car trip substitution rate by scootershare trips was 38.5 percent. This included scootershare programs in Santa Monica, Minneapolis, San Francisco, and Portland (McQueen et al. 2020).

- (F) – In Oregon, Portland's scootershare pilot data dashboard reports that the average trip length of scootershare trips is 2.14 miles (PBOT 2021).
- (G) – A summary report of the 2017 National Household Travel Survey data found that the average person in the U.S. takes 2.7 vehicle trips per day (FHWA 2018).
- (H) – Ideally, the user will calculate auto trip length for a plan/community at a scale no larger than a census tract. Potential data sources include the U.S. Census, California Household Travel Survey (preferred), or local survey efforts. If the user is not able to provide a plan-specific value using one of these data sources, they have the option to input the existing regional average one-way auto trip length for one of the six most populated CBSAs in California, as presented in Table T-10.1 in Appendix C (FHWA 2017). Trip lengths are likely to be longer for areas not covered by the listed CBSAs, which represent the denser areas of the state.

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) For projects that use default CBSA data from Table T-10.1, the maximum percent reduction in GHG emissions (A) is 0.07 percent. This maximum scenario is presented in the below example quantification.

Subsector Maximum

($\sum A_{max_{T\text{-}18 \text{ through } T\text{-}22\text{-}C}} \leq 10\%$) This measure is in the Neighborhood Design subsector. This subcategory includes Measures T-18 through T-22-C. The VMT reduction from the combined implementation of all measures within this subsector is capped at 10 percent.

Example GHG Reduction Quantification

The user reduces plan/community VMT by deploying scootershare throughout the area. In this example, the project is in the Los Angeles-Long Beach-Anaheim CBSA, and the one-way vehicle trip length would be 9.72 miles (H). Assuming 100 percent of residents in the plan/community would have scootershare access (C) where there was no existing access (B), the user would reduce GHG emissions from plan/community VMT by 0.07 percent.

$$A = -1 \times \frac{(100\% - 0\%) \times 0.021 \frac{\text{trips}}{\text{day·person}} \times 38.5\% \times 2.14 \frac{\text{miles}}{\text{trip}}}{2.7 \frac{\text{trips}}{\text{day·person}} \times 9.72 \frac{\text{miles}}{\text{trip}}} = -0.07\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an

adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A). This quantification methodology does not account for the increase in electricity used to charge the scooters or the fuel consumption from vehicle travel of program employees picking up and dropping off scooters.

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A). This quantification methodology does not account for the miles traveled from vehicle travel of program employees picking up and dropping off scooters.

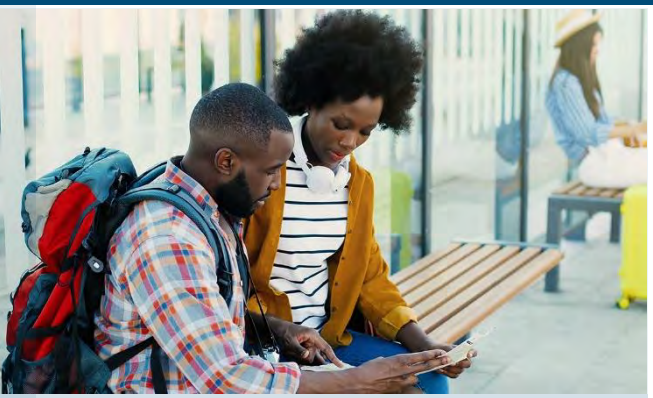
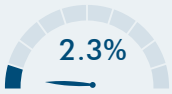
T-23. Provide Community-Based Travel Planning



GHG Mitigation Potential



Up to 2.3% of GHG emissions from vehicle travel in the plan/community

Co-Benefits (icon key on pg. 34)

Climate Resilience

CBTP can decrease vehicle use and thus improve air quality, resulting in health impacts that may increase the resilience of communities near freeways and roads. This can also increase the adaptive capacity of communities by informing them of travel alternatives if certain modes become disrupted due to extreme events.

Health and Equity Considerations

Outreach materials may need to be in multiple languages to address diverse linguistic communities.

Measure Description

This measure will target residences in the plan/community with community-based travel planning (CBTP). CBTP is a residential-based approach to outreach that provides households with customized information, incentives, and support to encourage the use of transportation alternatives in place of single occupancy vehicles, thereby reducing household VMT and associated GHG emissions.

Subsector

Trip Reduction Programs

Locational Context

Urban, suburban

Scale of Application

Plan/Community

Implementation Requirements

CBTP involves teams of trained travel advisors visiting all households within a targeted geographic area, having tailored conversations about residents' travel needs, and educating residents about the various transportation options available to them. Due to the personalized outreach method, communities are typically targeted in phases.

Cost Considerations

The main cost consideration for CBTP is labor costs for program managers and resident outreach staff plus material costs for development of educational material. The beneficiaries are the commuters who may be able to reduce vehicle usage or ownership. The local municipality may achieve cost savings through a reduction of cars on the road leading to lower infrastructure and roadway maintenance costs.

Expanded Mitigation Options

Pair with any of the Measures from T-17 through T-22-C to ensure that residents that are targeted by CBTP who want to use alternative transportation have the infrastructure and technology to do so.

GHG Reduction Formula

$$A = \frac{C}{B} \times D \times -E \times F$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from household vehicle travel in plan/community	0–2.3	%	calculated
User Inputs				
B	Residences in plan/community	[ ]	residences	user input
C	Residences in plan/community targeted with CBTP	[ ]	residences	user input
Constants, Assumptions, and Available Defaults				
D	Percent of targeted residences that participate	19	%	MTC 2021
E	Percent vehicle trip reduction by participating residences	12	%	MTC 2021
F	Adjustment factor from vehicle trips to VMT	1	unitless	assumed

Further explanation of key variables:

- (D) – Results from program evaluations of CBTP in several counties in Washington and Oregon across multiple years indicate that an average of 19 percent of residences targeted will participate (MTC 2021).
- (E) – Results from program evaluations of CBTP in several counties in Washington and Oregon across multiple years indicate that a 12 percent vehicle trip reduction will occur among participating residences (MTC 2021).
- (F) – The adjustment factor from vehicle trips to VMT is 1. This assumes that all vehicle trips will average out to typical trip length ("assumes all trip lengths are equal"). Thus, it can be assumed that a percentage reduction in vehicle trips will equal the same percentage reduction in VMT.

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The maximum percent reduction in GHG emissions (A) is 2.3 percent. This maximum scenario is presented in the below example quantification.

Subsector Maximum

Same as (A_{max}). Measure T-23 is the only measure at the Plan/Community scale within the Trip Reduction Programs subsector.

Example GHG Reduction Quantification

The user reduces household VMT by having residences in the plan/community participate in CBTP. In this example, all of the residences in a city of 5,000 are targeted (B and C), which would reduce GHG emissions from citywide household VMT by 2.3 percent.

$$A = \left(\frac{\text{5,000 residences}}{\text{5,000 residences}}\right) \times 19\% \times -12\% \times 1 = -2.3\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

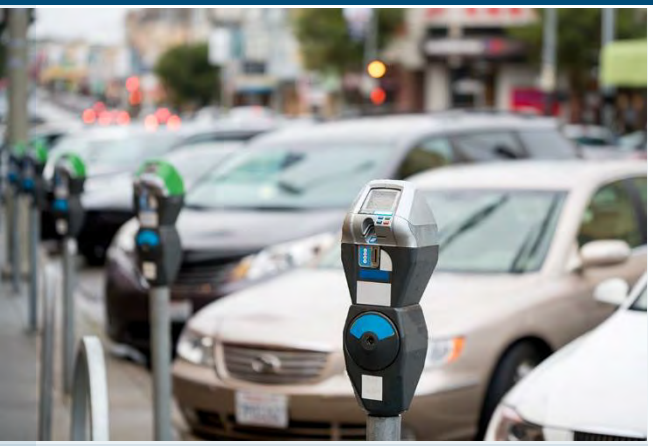
VMT Reductions

The percent reduction in household VMT would be the same as the percent reduction in GHG emissions (A).

Sources

- Metropolitan Transportation Commission (MTC). October 2021. *Plan Bay Area 2050, Forecasting and Modeling Report*. Available: https://www.planbayarea.org/sites/default/files/documents/Plan_Bay_Area_2050_Forecasting_Modeling_Report_October_2021.pdf. Accessed: November 2021.

T-24. Implement Market Price Public Parking (On-Street)



GHG Mitigation Potential

Up to 30.0% of GHG emissions from vehicle travel in the plan/community

Co-Benefits (icon key on pg. 34)

Climate Resilience

Implementing market price public parking could incentivize increased use of public transit and thus result in less traffic, potentially reducing congestion or delays on major roads during peak AM and PM traffic periods. In addition, this reduces illegal loading/standing in bus stops and travel lanes. When these reductions occur during extreme weather events, they better allow emergency responders to access a hazard site.

Health and Equity Considerations

Pricing on-street parking at market rates reduces illegal loading/standing in bus stops and travel lanes, improving transit times.

Measure Description

This measure will price all on-street parking in a given community, with a focus on parking near central business districts, employment centers, and retail centers. Increasing the cost of parking increases the total cost of driving to a location, incentivizing shifts to other modes and thus decreasing total VMT to and from the priced areas. This VMT reduction results in a corresponding reduction in GHG emissions.

Subsector

Parking or Road Pricing/Management

Locational Context

Urban, suburban

Scale of Application

Plan/Community

Implementation Requirements

When pricing on-street parking, best practice is to allow for dynamic adjustment of prices to ensure approximately 85 percent occupancy, which helps prevent induced VMT due to circling behaviors as individuals search for a vacant parking space. In addition, this method should primarily be implemented in areas with available alternatives to driving, such as transit availability within 0.5. mile or areas of high residential density nearby (allowing for increased walking/biking). If the measure is implemented in a small area, residential parking permit programs should be considered to prevent parking intrusion on nearby streets in residential areas without priced parking.

Cost Considerations

Municipalities may incur costs from installing the meter network, which may require meters at individual spaces or at more central terminals. There would also be staffing costs to monitor the metered spaces and collect payments. Residents also incur a cost by having to pay for on-street parking. A portion of costs to the municipality may be offset through revenue collected by the parking system.

Expanded Mitigation Options

Pricing on-street parking also helps support individual projects with priced onsite parking by removing potential alternative parking locations.

GHG Reduction Formula

$$A = \frac{B}{C} \times \frac{D - E}{E} \times F \times G \times H$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from vehicle travel in plan/community	0–30.0	%	calculated
User Inputs				
B	VMT in priced area without measure	[ ]	VMT per day	user input
C	VMT in plan/community without measure	[ ]	VMT per day	user input
D	Proposed parking price	1.00–5.00	$ per hour	user input
E	Initial parking price	0.00–5.00	$ per hour	user input
F	Default percentage of trips parking on street	5–75	%	user input
Constants, Assumptions, and Available Defaults				
G	Elasticity of parking demand with respect to price	-0.4	unitless	Pierce and Shoup 2013
H	Ratio of VMT to vehicle trips	1	unitless	assumption

Further explanation of key variables:

- (B and C) – Total daily VMT in both the priced area and the plan/community area should represent the expected total VMT generated by all land use in that area, including office, residences, retail, schools, and other uses. The most appropriate source for this data is from a local travel demand forecasting model. An alternate method uses VMT per worker or VMT per resident as calculated for SB 743 compliance and screening purposes multiplied by the population in the area.
  - These variables for VMT by area are used to ensure that the percent GHG reduction from the priced area is at the same geographic scale as the vehicle travel in the plan/community. If the area priced is a business district and the analysis is limited to the business district, then the VMT would be equal (B=C).
- (D) – The proposed parking price can be presented in cost per minute, hour, or day, provided that the same units are used for variable (E)
- (E) – Because this is used to calculate the percent change in parking price, if parking is free under existing conditions, (E) should be set to (1/2×D), resulting in a percentage change of 100 percent. In areas where metered parking is common, E may instead by set to equal the average metered parking price in nearby areas or districts.
- (F) – On-street parking represents only a portion of the total available parking supply. An estimate will typically range from 5 percent (in locations with offsite parking garages available) to 75 percent (in locations where most parcels have little to no onsite parking for visitors). The user should provide a project-specific value within this range, by surveying the total on-street vs. off-street parking spaces within ¼ mile of the study area.

- (G) – An evaluation of the SFPark program in San Francisco found that a 0.4 percent decrease in parking demand occurs for every 1 percent increase in parking price (Pierce and Shoup 2013). Price elasticity of parking demand varies by location, day of the week, and time of day.
- (H) – The adjustment factor from vehicle trips to VMT is 1. This assumes that all vehicle trips will average out to typical trip length ("assumes all trip lengths are equal"). Thus, it can be assumed that a percentage reduction in vehicle trips will equal the same percentage reduction in VMT.

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The total reduction in VMT due to on-street parking pricing is capped at 30 percent, which is based on the following assumptions:

- $\left(\frac{D-E}{E} = 100\%\right)$ – Parking prices double (i.e., increase by 100 percent) or parking pricing is introduced in previously free areas.
- (F) – 75 percent of all vehicle trips utilize on-street parking. Note that only within a small-scale commercial district is 75 percent of parking likely to occur on street.

This maximum scenario is presented in the below example quantification.

Subsector Maximum

Same as (A_{max}). Measure T-24 is the only measure at the Plan/Community scale within the Parking or Road Pricing/Management subsector.

Example GHG Reduction Quantification

The user reduces VMT by increasing hourly on-street parking costs. In this example, the hourly parking cost increases from $1.00 (E) to $2.00 (D) in a business district. The business district daily VMT is 1,000,000 (B), and the scale of implementation is the business district (B=C). If around 75 percent of the district's parking supply is on street (F), the user would reduce GHG emissions from VMT by 30 percent.

$$A = \frac{1{,}000{,}000\,\frac{VMT}{day}}{1{,}000{,}000\,\frac{VMT}{day}} \times \frac{\$2.00 - \$1.00}{\$1.00} \times 75\% \times -0.4 \times 1 = -30\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an

adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A).

T-25. Extend Transit Network Coverage or Hours

GHG Mitigation Potential

Up to 4.6% of GHG emissions from vehicle travel in the plan/community

Co-Benefits (icon key on pg. 34)

Climate Resilience

Increasing transit network coverage or hours improves the reliability of the transportation network and allows redundancy to exist even if an extreme event disrupts part of the system. They could also incentivize more people to use transit, resulting in less traffic and better allowing emergency responders to access a hazard site during an extreme weather event.

Health and Equity Considerations

This measure increases access to social, educational, and employment opportunities. Expansion of transit networks need to ensure equitable access by all communities to the transit system.

Measure Description

This measure will expand the local transit network by either adding or modifying existing transit service or extending the operation hours to enhance the service near the project site. Starting services earlier in the morning and/or extending services to late-night hours can accommodate the commuting times of alternative-shift workers. This will encourage the use of transit and therefore reduce VMT and associated GHG emissions.

Subsector

Transit

Locational Context

Urban, suburban

Scale of Application

Plan/Community

Implementation Requirements

There are two primary means of expanding the transit network: by increasing the frequency of service, thereby reducing average wait times and increasing convenience, or by extending service to cover new areas and times.

Cost Considerations

Infrastructure costs for extending the physical network coverage of a transit system can be significant. Costs to expand track-dependent transit, such as light rail and passenger rail, are high and can require resource- and time-intensive advanced planning. Costs to expand vehicle-dependent transit, such as busses, are likewise high but may be limited to procurement of additional vehicles. Any expansion of transit, including just service hours, would increase staffing and potentially maintenance costs. A portion of these costs may be offset by increased transit usage and associated income. Commuters who may more easily be able to travel without a car may also observe cost savings from reduce vehicle usage or ownership.

Expanded Mitigation Options

This measure is focused on providing additional transit network coverage, with no changes to transit frequency. This measure can be paired with Measure T-26, *Increase Transit Service Frequency*, which is focused on increasing transit service frequency, for increased reductions.

GHG Reduction Formula

$$A = -1 \times \frac{C - B}{B} \times D \times E \times F \times G$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from plan/community VMT	0–4.6	%	calculated
User Inputs				
B	Total transit service miles or service hours in plan/community before expansion	[ ]	miles	user input
C	Total transit service miles or service hours in plan/community after expansion	[ ]	miles	user input
D	Transit mode share in plan/community	Table T-3.1	%	user input
Constants, Assumptions, and Available Defaults				
E	Elasticity of transit demand with respect to service miles or service hours	0.7	unitless	Handy et al. 2013
F	Statewide mode shift factor	57.8	%	FHWA 2017
G	Ratio of vehicle trip reduction to VMT	1	unitless	assumption

Further explanation of key variables:

- (A) – This formula does not reflect any increase in transit vehicle travel and emissions, which can at least partially offset the reduction in GHG emissions from passenger vehicle travel. Inclusion of this component in the percent GHG reduction formula would require inputs that would not be available to most users.
- (B and C) – Transit service miles are defined as the total service mileage. Service hours represent the hours of operation. Either metric can be used in the GHG reduction formula so long as both B and C use the same metric.
- (D) – The transit mode share for the six most populated CBSAs in California are provided in Table T-3.1 in Appendix C (FHWA 2017). If the project study area is not within the listed CBSAs or the user is able to provide a project-specific value, the user should replace these regional defaults in the GHG reduction formula. It is likely for areas outside of the area covered by the listed CBSAs to have transit mode shares lower than the values provided in the table. Ideally, the user will calculate existing transit mode share for work trips or all trips at a scale no larger than a census tract. Potential data sources include the U.S. Census, California Household Travel Survey (preferred), or local survey efforts. Care should be taken to not present the reported commute mode share as retrieved from the ACS, unless the land use is office or employment based and the ACS tables are based on work location (rather than home location).
- (E) – A policy brief summarizing the results of transit service strategies concluded that a 0.7 percent increase in transit ridership occurs for every 1 percent increase in service miles or hours (Handy et al. 2013).

- (F) – Mode shift factor is an adjustment to reflect the reduction in vehicle trips associated with a reduction in person trips, since some vehicles carry more than one person. It is calculated as (1/average vehicle occupancy).
- (G) – The adjustment factor from vehicle trips to VMT is 1. This assumes that all vehicle trips will average out to typical trip length ("assumes all trip lengths are equal"). Thus, it can be assumed that a percentage reduction in vehicle trips will equal the same percentage reduction in VMT.

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The GHG reduction from expanding the transit network is capped at 4.6 percent, which is based on the following assumptions:

- $\left(\frac{C-B}{B} \leq 100\%\right)$ – The transit network increase is capped at a doubling in size, or 100 percent (twice as many revenue miles are provided, for a 100 percent increase).
- (D) – The CBSA is San Francisco-Oakland-Hayward, which has a default transit mode share for all trips of 11.38 percent.

This maximum scenario is presented in the below example quantification.

Subsector Maximum

($\sum A_{max_{T\text{-}25 \text{ through } T\text{-}29}} \leq 15\%$) This measure is in the Transit subsector. This subcategory includes Measures T-25 through T-29. The VMT reduction from the combined implementation of all measures within this subsector is capped at 15 percent.

Example GHG Reduction Quantification

The user reduces VMT by extending an existing transit route or lengthening the service hours. In this example, the project in a neighborhood of the San Francisco-Oakland-Hayward CBSA and would increase transit coverage in the area from 20 miles (B) to 40 miles (C). If the existing transit mode share in the study area is 11.38 percent (D), the user would reduce GHG emissions from VMT by 4.6 percent.

$$A = -1 \times \frac{(40 \text{ miles} - 20 \text{ miles})}{20 \text{ miles}} \times 11.38\% \times 0.7 \times 57.8\% \times 1 = -4.6\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in VMT would be the same as the percent reduction in GHG emissions (A).

T-26. Increase Transit Service Frequency

GHG Mitigation Potential

Up to 11.3% of GHG emissions from vehicle travel in the plan/community

Co-Benefits (icon key on pg. 34)

Climate Resilience

Increasing transit service frequency improves the reliability of the transportation network and allows redundancy to exist even if an extreme event disrupts part of the system. It could also incentivize more people to use transit, resulting in less traffic and better allow emergency responders to access a hazard site during an extreme weather event.

Health and Equity Considerations

This measure increases access to social, educational, and employment opportunities. Expansion of transit service needs to ensure equitable access by all communities to the transit system.

Measure Description

This measure will increase transit frequency on one or more transit lines serving the plan/community. Increased transit frequency reduces waiting and overall travel times, which improves the user experience and increases the attractiveness of transit service. This results in a mode shift from single occupancy vehicles to transit, which reduces VMT and associated GHG emissions.

Subsector

Transit

Locational Context

Urban, suburban

Scale of Application

Plan/Community

Implementation Requirements

See measure description.

Cost Considerations

Increasing transit service frequency may require capital investment to purchase additional vehicles. Staff and maintenance costs may also increase. A portion of these costs may be offset by increased transit usage and associated income. Commuters who may more easily be able to travel without a car may also observe cost savings from reduce vehicle usage or ownership.

Expanded Mitigation Options

This measure is focused on providing increased transit frequency, with no changes to transit network coverage. This measure can be paired with Measure T-25, *Extend Transit Network Coverage or Hours*, which is focused on increasing transit network coverage, for increased reductions.

GHG Reduction Formula

$$A = -C \times \frac{B \times E \times D \times G}{F}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from vehicle travel in plan/community	0–11.3	%	calculated
User Inputs				
B	Percent increase in transit frequency	0–300	%	user input
C	Level of implementation	0–100	%	user input
Constants, Assumptions, and Available Defaults				
D	Elasticity of transit ridership with respect to frequency of service	0.5	unitless	Handy et al. 2013
E	Transit mode share in plan/community	Table T-3.1	%	FHWA 2017a
F	Vehicle mode share in plan/community	Table T-3.1	%	FHWA 2017a
G	Statewide mode shift factor	57.8	%	FHWA 2017b

Further explanation of key variables:

- (A) – This formula does not reflect any increase in transit vehicle travel and emissions, which can at least partially offset the reduction in GHG emissions from passenger vehicle travel. Inclusion of this component in the percent GHG reduction formula would require inputs that would not be available to most users. Users can calculate the absolute changes in passenger vehicle and bus VMT and emissions using the process described under *Co-Benefits*.
- (B) – Frequency is measured as the number of arrivals over a given time (e.g., buses per hour). Frequency is the inverse of transit headway, defined as the time between transit vehicle arrivals on a given route. This variable can be calculated as [transit frequency with measure minus existing transit frequency] divided by existing transit frequency.
- (C) – The level of implementation refers to the number of transit routes receiving the frequency improvement as a fraction of the total transit routes in the plan/community.
- (D) – A policy brief summarizing the results of transit service strategies concluded that a 0.5 percent increase in transit ridership occurs for every 1 percent increase in frequency (Handy et al. 2013).
- (E and F) – Ideally, the user will calculate transit and auto mode shares for a plan/community at the city scale (or larger). Potential data sources include the California Household Travel Survey (preferred) or local survey efforts. If the user is not able to provide a project-specific value using one of these data sources, they have the option to input the mode shares for transit and vehicles for one of the six most populated CBSAs in California, as presented in Table T-3.1 in Appendix C. It is likely for areas outside of

the area covered by the listed CBSAs to have vehicle mode shares higher and transit mode shares lower than the values provided in the table.

- (G) – Mode shift factor is an adjustment to reflect the reduction in vehicle trips associated with a reduction in person trips, since some vehicles carry more than one person. It is calculated as (1/average vehicle occupancy).

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) For projects that use default CBSA data from Table T-3.1 and (B_{max}), the maximum percent reduction in GHG emissions (A) is 11.3 percent. This maximum scenario is presented in the below example quantification.

(B_{max}) The percent change in transit frequency is capped at 300 percent (SANDAG 2019).

Subsector Maximum

($\sum A_{max_{T\text{-}25 \text{ through } T\text{-}29}} \leq 15\%$) This measure is in the Transit subsector. This subcategory includes Measures T-25 through T-29. The VMT reduction from the combined implementation of all measures within this subsector is capped at 15 percent.

Mutually Exclusive Measures

If the user selects Measure T-28, *Provide Bus Rapid Transit*, and converts all transit routes in the plan/community to BRT, then the user cannot also take credit for this measure or Measure T-27, *Implement Transit-Supportive Roadway Treatments*. This is because Measure T-28 accounts for the VMT reduction associated with increased transit frequency and decreased transit travel time as well as the additional BRT-specific bonus. To combine the GHG reductions from Measure T-28 with Measure T-27 and/or Measure T-26 would be considered double counting. However, where BRT is proposed on less than all of the existing bus routes in the plan/community area, this measure and/or Measure T-27 could be applied to the remaining bus routes, and the measure reductions could be combined with Measure T-28 to determine the emissions reduction at the larger plan/community scale.

Example GHG Reduction Quantification

The user reduces plan/community GHGs by increasing transit frequency, thereby encouraging a mode shift from vehicles to transit and reducing VMT. In this example, the project is in the San Francisco-Oakland-Hayward CBSA where the transit and vehicle mode shares would be 11.38 percent and 86.96 percent, respectively (E and F). Assuming the maximum increase in transit frequency of 300 percent (B) and implementation for all transit routes (100 percent) in the plan/community (C), the user would reduce plan/community GHG emissions from VMT by 11.3 percent.

$$A = -100\% \times \frac{300\% \times 11.38\% \times 0.5 \times 57.8\%}{86.96\%} = -11.3\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

VMT Reductions

The decrease in passenger vehicle miles (H) and increase in bus miles (L) by the measure can be calculated as follows.

Passenger Vehicle VMT Reduction Formula

The percent reduction in passenger VMT would be the same as the percent reduction in GHG emissions (A). The absolute reduction in passenger VMT can be calculated using the following formula.

$$H = I \times E \times J \times B \times D \times G \times K$$

Passenger Vehicle VMT Reduction Calculation Variables

ID	Variable	Value	Unit	Source
Output				
H	Reduction in passenger vehicle miles in plan/community	[ ]	miles per year	calculated
User Inputs				
I	Total daily person trips in corridor(s)	[ ]	trips per day	user input
J	Vehicle trip length	[ ]	miles per trip	user input
Constants, Assumptions, and Available Defaults				
K	Days per year transit available	365	days per year	assumed

Further explanation of key variables:

- (I) – The total daily person trips in the corridor(s) represents the total daily trips by all modes between the bus route origin area and the bus route destination area. This may be obtained through travel demand modeling. If the strategy involves frequency improvements for more than one transit route, then the total person trips should reflect the sum of all the routes being improved.
- (J) – If the strategy involves frequency improvements for more than one transit route, then the trip length should reflect the average of all the routes being improved.
- Please refer to the GHG Calculation Variables table above for definitions of variables that have been previously defined.

Bus VMT Increase Formula

The absolute increase in bus VMT can be calculated using the formula below. As noted above, the formula for the percent GHG reduction (A) does not reflect any increase in bus VMT and bus emissions. Users that wish to capture these impacts should calculate absolute changes.

$$L = P \times (M_2 - M_1) \times N \times O \times K$$

Bus VMT Increase Calculation Variables

ID	Variable	Value	Unit	Source
Output				
L	Increase in annual bus miles in plan/community	[ ]	miles per year	calculated
User Inputs				
M_1	Bus frequency without measure	[ ]	transit vehicle roundtrips per hour	user input
M_2	Bus frequency with measure	[ ]	transit vehicle roundtrips per hour	user input
N	Bus hours of operation	0–24	hours per day	user input
O	Bus route one-way length	[ ]	miles per route	user input
Constants, Assumptions, and Available Defaults				
P	One-way trips in a roundtrip	2	one-way trips per roundtrip	conversion

Further explanation of key variables:

- (L) – If the strategy involves frequency improvements for more than one transit route, then the increase in bus miles should be calculated separately for each route.
- Please refer to the GHG Calculation Variables table above for definitions of variables that have been previously defined.

Energy and Fuel Savings

The decrease in passenger vehicle fuel consumption and increase in bus fuel consumption by the measure can be calculated as follows.

Passenger Vehicle Fuel Use Reduction Formula

Multiply the reduction in passenger vehicle miles (H) above by the fuel efficiency of the vehicle type (see Table T-30.2 in Appendix C) to output the change in fuel consumption.

Bus Fuel Use Increase Formula

The absolute increase in bus fuel consumption (Q) can be calculated using the formula below.

$$Q = L \times R$$

Bus Fuel Use Increase Calculation Variables

ID	Variable	Value	Unit	Source
Output				
Q	Increase in annual bus fuel consumption in plan/community	[ ]	gal per year	calculated
User Inputs				
	None			
Constants, Assumptions, and Available Defaults				
R	Fuel economy of a transit bus, by fuel type	Table T-26.1	gal or kilowatt hour per mile	CARB 2020; U.S. DOE 2021

Further explanation of key variables:

- (R) – The average fuel economy for gasoline, diesel, and natural gas transit buses was calculated using EMFAC2017 (v1.0.3). The model was run for a 2020 statewide average of UBUS vehicles, disaggregated by fuel type (CARB 2020). The efficiency of electric buses was calculated based on the gasoline equivalent value (U.S. DOE 2021). The user should reference Table T-26.1 for the fuel economy of the appropriate fuel type for their location's transit system. If the user can provide a project-specific value (i.e., for a future year and project location), the user should run EMFAC to replace the default in the fuel use increase formula.
- Please refer to the Bus VMT Increase Calculation Variables table above for definitions of variables that have been previously defined.

T-27. Implement Transit-Supportive Roadway Treatments

GHG Mitigation Potential

Up to 0.6% of GHG emissions from vehicle travel in the plan/community

Co-Benefits (icon key on pg. 34)

Climate Resilience

Implementing transit-supportive roadway treatments improves the reliability of the transportation network and allows redundancy to exist even if an extreme event disrupts part of the system. It could also incentivize more people to use transit, resulting in less traffic and better allowing emergency responders to access a hazard site during an extreme weather event. Furthermore, emergency responders can use queue jumps and dedicated bus lanes when needed.

Health and Equity Considerations

Transit facilities can have conflicts with cyclists. Consider appropriate treatments to minimize conflicts. Improved transit investments should be equitably distributed prioritizing areas with transit deficiencies in underserved communities.

Measure Description

This measure will implement transit-supportive treatments on the transit routes serving the plan/community. Transit-supportive treatments incorporate a mix of roadway infrastructure improvements and/or traffic signal modifications to improve transit travel times and reliability. This results in a mode shift from single occupancy vehicles to transit, which reduces VMT and the associated GHG emissions.

Subsector

Transit

Locational Context

Urban, suburban

Scale of Application

Plan/Community

Implementation Requirements

Treatments can include transit signal priority, bus-only signal phases, queue jumps, curb extensions to speed passenger loading, and dedicated bus lanes.

Cost Considerations

Costs and savings of transit-supportive roadway treatments vary depending on the strategy pursued, ranging from low-cost route optimization changes to high-cost infrastructure projects (e.g., bus-only lanes). Reducing route cycle time without significantly increasing the number of transit vehicles can result in net cost savings for the transit system. Dedicated transit infrastructure will improve transit reliability and increase ridership. This supplements existing transit income streams for municipalities. Increased ridership similarly reduces vehicle use, which has cost benefits for both commuters and municipalities.

Expanded Mitigation Options

This measure could be paired with other Transit subsector strategies (Measure T-25 and Measure T-29) for increased reductions.

GHG Reduction Formula

$$A = -1 \times \frac{B \times C \times D \times E \times G}{F}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from vehicle travel in plan/community	0–0.6	%	calculated
User Inputs				
B	Percent of plan/community transit routes that receive treatments	0–100	%	user input
Constants, Assumptions, and Available Defaults				
C	Percent change in transit travel time due to treatments	-10	%	TRB 2007
D	Elasticity of transit ridership with respect to transit travel time	-0.4	unitless	TRB 2007
E	Transit mode share in plan/community	Table T-3.1	%	FHWA 2017a
F	Vehicle mode share in plan/community	Table T-3.1	%	FHWA 2017a
G	Statewide mode shift factor	57.8	%	FHWA 2017b

Further explanation of key variables:

- (C) – A literature review of studies from the U.S. and United Kingdom indicates that the travel time savings associated with one type of transit-supportive roadway treatment—transit signal prioritization—typically ranged from 8 to 12 percent (TRB 2007). To account for the likelihood that a user would implement multiple transit-supportive treatments, the midpoint of this range is used for the measure formula. Use of the midpoint is still conservative given the additional travel time savings associated with other transit-supportive treatments. If the user can provide a project-specific value based on the suite of their treatments, then the user should replace this default in the GHG reduction formula.
- (E and F) – Ideally, the user will calculate transit and auto mode shares for a plan/community at the city scale (or larger). Potential data sources include the California Household Travel Survey (preferred) or local survey efforts. If the user is not able to provide a project-specific value using one of these data sources, they have the option to input the mode shares for transit and vehicles for one of the six most populated CBSAs in California, as presented in Table T-3.1 in Appendix C. It is likely for areas outside of the area covered by the listed CBSAs to have vehicle mode shares higher and transit mode shares lower than the values provided in the table.

- (G) – Mode shift factor is an adjustment to reflect the reduction in vehicle trips associated with a reduction in person trips as some vehicles carry more than one person. It is calculated as (1/average vehicle occupancy) (FHWA 2017b).

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) For projects that use default CBSA data from Table T-3.1 and (C_{max}), the maximum percent reduction in GHG emissions (A) is 0.6 percent. This maximum scenario is presented in the below example quantification.

(C_{max}) The percent reduction in transit travel time is capped at 20 percent, which is based on the values reported in a literature review of studies from the U.S. and United Kingdom (TRB 2007).

Subsector Maximum

($\sum A_{max_{T\text{-}25 \text{ through } T\text{-}29}} \leq 15\%$) This measure is in the Transit subsector. This subcategory includes Measures T-25 through T-29. The VMT reduction from the combined implementation of all measures within this subsector is capped at 15 percent.

Mutually Exclusive Measures

If the user selects Measure T-28, *Provide Bus Rapid Transit*, and converts all transit routes in the plan/community to BRT, then the user cannot also take credit for this measure or Measure T-26, *Increase Transit Service Frequency*. This is because Measure T-28 accounts for the VMT reduction associated with increased transit frequency and decreased transit travel time as well as the additional BRT-specific bonus. To combine the GHG reductions from Measure T-28 with Measure T-27 and/or Measure T-26 would be considered double counting. However, where BRT is proposed on less than all of the existing bus routes in the plan/community area, this measure and/or Measure T-26 could be applied to the remaining bus routes, and the measure reductions could be combined with Measure T-28 to determine the emissions reduction at the larger plan/community scale.

Example GHG Reduction Quantification

The user reduces plan/community GHGs by implementing transit-supportive roadway treatments that decrease transit travel time, thereby encouraging a mode shift from vehicles to transit and reducing VMT. In this example, the project is in San Francisco-Oakland-Hayward CBSA where the transit and vehicle mode shares would be 11.38 percent and 86.96 percent, respectively (E and G). Assuming the maximum decrease in transit travel time of 20 percent (C_{max}) and implementation for all transit routes (100 percent) in the plan/community (B), the user would reduce plan/community GHG emissions from VMT by 0.6 percent.

$$A = -1 \times \frac{100\% \times -20\% \times -0.4 \times 11.38\% \times 57.8\%}{86.96\%} = -0.6\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in passenger vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in passenger VMT would be the same as the percent reduction in GHG emissions (A).

T-28. Provide Bus Rapid Transit

Photo Credit: LA Metro, 2021

GHG Mitigation Potential

13.8%

Up to 13.8% of GHG emissions from vehicle travel in the plan/community

Co-Benefits (icon key on pg. 34)

Climate Resilience

Providing BRT can incentivize more people to use transit, resulting in less traffic and better allowing emergency responders to access a hazard site during an extreme weather event. Furthermore, emergency responders can use queue jumps and dedicated BRT lanes when needed.

Health and Equity Considerations

Transit facilities can have conflicts with cyclists. Consider appropriate BRT components to minimize conflicts. Improved transit investments should be equitably distributed, prioritizing areas with transit deficiencies in underserved communities.

Measure Description

This measure will convert an existing bus route to a bus rapid transit (BRT) system. BRT includes the following additional components, compared to traditional bus service: exclusive right-of-way (e.g., busways, queue jumping lanes) at congested intersections, increased limited-stop service (e.g., express service), intelligent transportation technology (e.g., transit signal priority, automatic vehicle location systems), advanced technology vehicles (e.g., articulated buses, low-floor buses), enhanced station design, efficient fare-payment smart cards or smartphone apps, branding of the system, and use of vehicle guidance systems. BRT can increase the transit mode share in a community due to improved travel times, service frequencies, and the unique components of the BRT system. This mode shift reduces VMT and the associated GHG emissions.

Subsector

Transit

Locational Context

Urban, suburban

Scale of Application

Plan/Community

Implementation Requirements

The measure quantification methodology accounts for the increase in ridership from (1) improved travel times from transit signal prioritization, (2) increased service frequency, and (3) the unique ridership increase associated with a full-featured BRT service operating on a fully segregated running way with specialized (or stylized) vehicles, attractive stations, and efficient fare collection practices. To take credit for the estimated emissions reduction, the user should implement, at minimum, these components.

Cost Considerations

Providing BRT will require capital investment to purchase specialized vehicles, develop passenger information systems, and construct stations and busways. Total costs vary depending on the suite of BRT components pursued. Grade-separated busways are more expensive than at-grade busways and mixed flow lanes. Dedicated transit infrastructure will improve transit reliability and increase ridership. This supplements existing transit income streams for municipalities. Increased ridership similarly reduces vehicle use, which has cost benefits for both commuters and municipalities.

Expanded Mitigation Options

This measure could be paired with Measure T-25, *Extend Transit Network Coverage or Hours,* and Measure T-29, *Reduce Transit Fares,* for increased reductions.

GHG Reduction Formula

$$A = -C \times \frac{D \times F \times ((B \times I) + (H \times J) + G)}{E}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from vehicle travel in plan/community	0–13.8	%	calculated
User Inputs				
B	Percent increase in transit frequency due to BRT	0–300	%	user input
C	Level of implementation	0–100	%	user input
Constants, Assumptions, and Available Defaults				
D	Transit mode share in plan/community	Table T-3.1	%	FHWA 2017a
E	Vehicle mode share in plan/community	Table T-3.1	%	FHWA 2017a
F	Statewide mode shift factor	57.8	%	FHWA 2017b
G	Percent change in transit ridership due to BRT	25	%	TRB 2007
H	Percent change in transit travel time due to BRT	-10 to -20	%	TRB 2007
I	Elasticity of transit ridership with respect to frequency of service	0.5	unitless	Handy et al. 2013
J	Elasticity of transit ridership with respect to transit travel time	-0.4	unitless	TRB 2007

Further explanation of key variables:

- (A) – This formula does not reflect any increase in transit vehicle travel and emissions, which can at least partially offset the reduction in GHG emissions from passenger vehicle travel.[14] Inclusion of this component in the percent GHG reduction formula would require inputs that would not be available to most users. Users can calculate the absolute changes in passenger vehicle and bus VMT and emissions using the process described under *Co-Benefits*.
- (B) – Frequency is measured as the number of arrivals over a given time (e.g., buses per hour). Frequency is the inverse of transit headway, defined as the time between transit vehicle arrivals on a given route. This variable can be calculated as [transit frequency with measure minus existing transit frequency] divided by existing transit frequency.

[14] As discussed in Chapter 2, *Integrated and Resilient Planning*, the ICT regulation requires all public transit agencies to gradually transition to 100 percent zero-emission bus fleets by 2040. Accordingly, combustion emissions from transit operation will decline as vehicle fleets move to achieve the state's zero-emission bus goals.

- (C) – The level of implementation refers to the number of transit routes receiving the frequency improvement as a fraction of the total transit routes in the plan/community.
- (D and E) – Ideally, the user will calculate transit and auto mode shares for a plan/community at the city scale (or larger). Potential data sources include the California Household Travel Survey (preferred) or local survey efforts. If the user is not able to provide a project-specific value using one of these data sources, the user has the option to input the mode shares for transit and vehicles for one of the six most populated CBSAs in California, as presented in Table T-3.1 in Appendix C. It is likely for areas outside of the area covered by the listed CBSAs to have vehicle mode shares higher and transit mode shares lower than the values provided in the table.
- (F) – Mode shift factor is an adjustment to reflect the reduction in vehicle trips associated with a reduction in person trips, since some vehicles carry more than one person. It is calculated as (1/average vehicle occupancy).
- (G) – A BRT practitioner's guide summarizing the results of numerous BRT case studies concluded that, on top of the ridership gains from improved travel times and increased service frequency, an additional 25 percent increase in ridership would occur from a full-featured BRT service operating on a fully segregated running way with specialized (or stylized) vehicles, attractive stations, and efficient fare collection practices.
- (H) – A literature review of studies from the United States and United Kingdom indicates that the travel time savings associated with one type of BRT component—transit signal prioritization—typically average 10 percent (TRB 2007). If the user can provide a project-specific value based on the suite of BRT components, then the user should replace this default in the GHG reduction formula. Note that, as described below, (H) should not exceed 20 percent.
- (I) – A policy brief summarizing the results of transit service strategies concluded that a 0.5 percent increase in transit ridership occurs for every 1 percent increase in frequency (Handy et al. 2013).
- (J) – A BRT practitioner's guide summarizing the results of numerous BRT case studies concluded that a -0.4 percent decrease in transit ridership occurs for every 1 percent increase in transit travel time (TRB 2007).

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) For projects that use default CBSA data from Table T-3.1 and (B_{max}), the maximum percent reduction in GHG emissions (A) is 13.8 percent. This maximum scenario is presented in the below example quantification.

(B_{max}) The percent change in transit frequency is capped at 300 percent (SANDAG 2019).

(H_{max}) The percent reduction in transit travel time is capped at 20 percent, which is based on the values reported in a literature review of studies from the United States and United Kingdom (TRB 2007).

Subsector Maximum

($\sum A_{max_{T\text{-}25 \text{ through } T\text{-}29}} \leq 15\%$) This measure is in the Transit subsector. This subcategory includes Measures T-25 through T-29. The VMT reduction from the combined

implementation of all the non–mutually-exclusive measures within this subsector is capped at 15 percent.

Mutually Exclusive Measures

If the user selects this measure and converts all transit routes in the plan/community to BRT (B), then the user cannot also take credit for Measure T-26, *Increase Transit Service Frequency*, or Measure T-27, *Implement Transit-Supportive Roadway Treatments*. This is because Measure T-28 accounts for the VMT reduction associated with increased transit frequency and decreased transit travel time as well as the additional BRT-specific bonus. To combine the GHG reductions from Measure T-28 with Measure T-27 and/or Measure T-26 would be considered double counting. However, where BRT is proposed on less than all of the existing bus routes in the plan/community area, Measure T-26 and/or Measure T-27 could be applied to the remaining bus routes, and the measure reductions could be combined to determine the emissions reduction at the larger plan/community scale.

Example GHG Reduction Quantification

The user reduces plan/community GHGs by implementing a full-featured BRT system, thereby encouraging a mode shift from vehicles to transit and reducing VMT. In this example, the project is in the San Francisco–Oakland–Hayward CBSA where transit and vehicle mode shares would be 11.38 percent and 86.96 percent, respectively (D and E). Assuming the maximum increase in transit frequency of 300 percent (B_{max}), the maximum decrease in transit travel time of 20 percent (H_{max}), and implementation for all transit routes (100 percent) in the plan/community (B), the user would reduce plan/community GHG emissions from VMT by 13.8 percent.

$$A = -100\% \times \frac{11.38\% \times 57.8\% \times ((300\% \times 0.5) + (-20\% \times -0.4) + 25\%)}{86.96\%} = -13.8\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

VMT Reductions

The decrease in passenger vehicle miles (K) and increase in BRT miles (O) by the measure can be calculated as follows.

Passenger Vehicle VMT Reduction Formula

The percent reduction in passenger VMT would be the same as the percent reduction in GHG emissions (A). The absolute reduction in passenger VMT can be calculated using the following formula.

$$K = -\left(D \times \mathbf{L} \times \mathbf{M} \times N \times \left((\mathbf{B} \times I) + (H \times J) + G\right)\right)$$

Passenger Vehicle VMT Reduction Calculation Variables

ID	Variable	Value	Unit	Source
Output				
K	Reduction in passenger vehicle miles in plan/community	[ ]	miles per year	calculated
User Inputs				
L	Total daily person trips in corridor(s)	[ ]	trips per day	user input
M	Vehicle trip length	[ ]	miles per trip	user input
Constants, Assumptions, and Available Defaults				
N	Days per year BRT available	365	days per year	assumed

Further explanation of key variables:

- (L) – The total daily person trips in the corridor(s) represents the total daily trips by all modes between the BRT origin area and the BRT destination area. This may be obtained through travel demand modeling. If the strategy involves BRT for more than one route, then the total person trips should reflect the sum of all the routes being improved.
- (M) – If the strategy involves BRT for more than one transit route, then the trip length should reflect the average of all the routes being converted.
- Please refer to the GHG Calculation Variables table above for definitions of variables that have been previously defined.

BRT VMT Increase Formula

The absolute increase in BRT VMT can be calculated using the formula below. As noted above, the formula for the percent GHG reduction (A) does not reflect any increase in BRT VMT or BRT emissions. Users that wish to capture these impacts should calculate absolute changes.

$$O = S \times (\mathbf{P_2} - \mathbf{P_1}) \times \mathbf{Q} \times \mathbf{R} \times N$$

BRT VMT Increase Calculation Variables

ID	Variable	Value	Unit	Source
Output				
O	Increase in annual BRT miles in plan/community	[ ]	miles per year	calculated
User Inputs				
P_1	Bus frequency without measure	[ ]	transit vehicle roundtrips per hour	user input
P_2	BRT frequency with measure	[ ]	transit vehicle roundtrips per hour	user input
Q	BRT hours of operation	0–24	hours per day	user input
R	BRT route one-way length	[ ]	miles per route	user input
Constants, Assumptions, and Available Defaults				
S	One-way trips in a roundtrip	2	One-way trips per roundtrip	conversion

Further explanation of key variables:

- (O) – If the strategy involves frequency improvements for more than one transit route, then the increase in BRT miles should be calculated separately for each route.
- Please refer to the Passenger Vehicle VMT Reduction Calculation Variables table above for definitions of variables that have been previously defined.

Energy and Fuel Savings

The decrease in passenger vehicle fuel consumption and increase in BRT fuel consumption by the measure can be calculated as follows.

Passenger Vehicle Fuel Use Reduction Formula

Multiply the reduction in passenger vehicle miles (K) above by the fuel efficiency of the vehicle type (see Table T-30.2 in Appendix C) to output the change in fuel consumption.

BRT Fuel Use Increase Formula

The absolute increase in BRT fuel consumption (T) can be calculated using the formula below.

$$T = O \times U$$

BRT Fuel Use Increase Calculation Variables

ID	Variable	Value	Unit	Source
Output				
T	Increase in annual BRT fuel consumption in plan/community	[ ]	gal per year	calculated
User Inputs				
	None			
Constants, Assumptions, and Available Defaults				
U	Fuel economy of BRT, by fuel type	Table T-26.1	gal or kilowatt hour per mile	CARB 2020; U.S. DOE 2021

Further explanation of key variables:

- (U) – The average fuel economy for gasoline, diesel, and natural gas transit buses was calculated using EMFAC2017 (v1.0.3). The model was run for a 2020 statewide average of UBUS vehicles, disaggregated by fuel type (CARB 2020). The efficiency of electric buses was calculated based on the gasoline equivalent value (U.S. DOE 2021). The user should reference Table T-26.1 for the fuel economy of the appropriate fuel type for their location's transit system. If the user can provide a project-specific value (i.e., for a future year and project location), the user should run EMFAC to replace the default in the fuel use increase formula. Also, if the BRT vehicles are fueled by hydrogen, the user will need to calculate the increase in hydrogen fuel consumption using project-specific values, as hydrogen is currently not included as a fuel type in EMFAC.
- Please refer to the BRT VMT Increase Calculation Variables table above for definitions of variables that have been previously defined.

T-29. Reduce Transit Fares

GHG Mitigation Potential

Up to 1.2% of GHG emissions from vehicle travel in the plan/community

Co-Benefits (icon key on pg. 34)

Climate Resilience

Reducing transit fares increases the capacity of low-income populations to use transit to evacuate or access resources during extreme weather events. Reduced fares could also incentivize more people to use transit, resulting in less traffic and better allowing emergency responders to access sites. This also reduces transit system disruptions due to extreme weather events. Lower transportation costs would also increase community resilience by freeing up resources for other purposes, such as increased cooling costs.

Health and Equity Considerations

Transit fare reduction programs should first prioritize routes with higher-volume potential in underserved communities and those most reliant on transit for travel (e.g., students, persons with disabilities, seniors).

Measure Description

This measure will reduce transit fares on the transit lines serving the plan/community. A reduction in transit fares creates incentives to shift travel to transit from single-occupancy vehicles and other traveling modes, which reduces VMT and associated GHG emissions.

This measure differs from Measure T-8, *Implement Subsidized or Discounted Transit Program*, which can be offered through employer-based benefits programs in which the employer fully or partially pays the employee's cost of transit.

Subsector

Transit

Locational Context

Urban, suburban

Scale of Application

Plan/Community

Implementation Requirements

Transit fare reductions can be implemented systemwide or in specific fare-free or reduced-fare zones.

Cost Considerations

Reducing transit fares will lower the per capita income of the transit service. This may be outweighed by increased ridership, and savings on infrastructure costs due to reduced car usage. Reduced fares can be targeted to specific populations or groups, depending on need. Individuals receiving the reduced fare will obtain a cost savings.

Expanded Mitigation Options

This measure could be paired with other Transit subsector strategies (Measure T-25, *Extend Transit Network Coverage or Hours,* and Measure T-26, *Increase Transit Service Frequency*) for increased reductions.

GHG Reduction Formula

$$A = \frac{B \times C \times D \times E \times G}{F}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from vehicle travel in plan/community	0–1.2	%	calculated
User Inputs				
B	Percent reduction in transit fare with measure	0–50	%	user input
C	Percent of plan/community transit routes that receive reduced fares	0–100	%	user input
Constants, Assumptions, and Available Defaults				
D	Elasticity of transit ridership with respect to transit fare	-0.3	unitless	Handy et al. 2013
E	Transit mode share in plan/community	Table T-3.1	%	FHWA 2017a
F	Vehicle mode share in plan/community	Table T-3.1	%	FHWA 2017a
G	Statewide mode shift factor	57.8	%	FHWA 2017a

Further explanation of key variables:

- (B) – The user can calculate the percent reduction in transit fare based on the percent difference between the existing fare price and the proposed fare price.
- (C) – The level of implementation refers to the fraction of transit routes that on which fare reductions are implemented. Typically, fare reductions are made system-wide, so this variable would be 100.
- (D) – A policy brief summarizing the results of transit service studies reported that a 0.3 to 1.0 percent increase in transit ridership occurs for every 1.0 percent decrease in transit fares (Handy et al. 2013). To be conservative, the low end of this range is cited.
- (E and F) – Ideally, the user will calculate transit and auto mode shares for a plan/community at the city scale (or larger). Potential data sources include the California Household Travel Survey (preferred) or local survey efforts. If the user is not able to provide a project-specific value using one of these data sources, they have the option to input the mode shares for transit and vehicles for one of the six most populated CBSAs in California, as presented in Table T-3.1 in Appendix C. It is likely for areas outside of the area covered by the listed CBSAs to have vehicle mode shares higher and transit mode shares lower than the values provided in the table.
- (G) – Mode shift factor is an adjustment to reflect the reduction in vehicle trips associated with a reduction in person trips as some vehicles carry more than one person. It is calculated as (1/average vehicle occupancy) (FHWA 2017b).

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) For projects that use default CBSA data from Table T-3.1 and (B_{max}), the maximum percent reduction in GHG emissions (A) is 1.2 percent.

(B_{max}) The percent reduction in transit fare is capped at 50 percent (SANDAG 2019).

Subsector Maximum

($\sum A_{max_{T\text{-}25 \text{ through } T\text{-}29}} \leq 15\%$) This measure is in the Transit subsector. This subcategory includes Measures T-25 through T-29. The VMT reduction from the combined implementation of all measures within this subsector is capped at 15 percent.

Example GHG Reduction Quantification

The user reduces plan/community GHGs by reducing the costs associated with using transit, thereby encouraging a mode shift from single occupancy vehicles to transit and reducing VMT. In this example, the project is in the San Jose-Sunnyvale-Santa Clara CBSA, where the transit and vehicle mode shares would be 6.69 percent and 91.32 percent, respectively (E and F). Assuming the maximum decrease in transit fares of 50 percent (B) and implementation for all transit routes (100 percent) in the plan/community (C), the user would reduce plan/community GHG emissions from VMT by 0.6 percent.

$$A = \frac{50\% \times 100\% \times -0.3 \times 6.69\% \times 57.8\%}{91.32\%} = -0.6\%$$

Quantified Co-Benefits

Improved Local Air Quality

The percent reduction in GHG emissions (A) would be the same as the percent reduction in NO_X, CO, NO_2, SO_2, and PM. Reductions in ROG emissions can be calculated by multiplying the percent reduction in GHG emissions (A) by an adjustment factor of 87 percent. See *Adjusting VMT Reductions to Emission Reductions* above for further discussion.

Energy and Fuel Savings

The percent reduction in passenger VMT would be the same as the percent reduction in GHG emissions (A).

VMT Reductions

The percent reduction in passenger vehicle fuel consumption would be the same as the percent reduction in GHG emissions (A).

T-30. Use Cleaner-Fuel Vehicles

GHG Mitigation Potential

Up to 100% of GHG emissions from on-road vehicles

Co-Benefits (icon key on pg. 34)

Climate Resilience

Using cleaner-fuel vehicles increases transportation resilience by providing a wider range of available vehicles if other fuels (like gasoline) become unavailable.

Health and Equity Considerations

While most cleaner fuels reduce both GHG and criteria air pollutants, a few may increase criteria pollutant emissions. The most prominent example of this is biodiesel, which generally results in higher NO_x emissions, but lower PM emissions compared to diesel.

Measure Description

This measure requires use of cleaner-fuel vehicles in lieu of similar vehicles powered by gasoline or diesel fuel. Cleaner-fuel vehicles addressed in this measure include electric vehicles, natural gas and propane vehicles, and vehicles powered by biofuels such as composite diesel (blend of renewable diesel, biodiesel, and conventional fossil diesel), ethanol, and renewable natural gas.

The full GHG emissions impact of cleaner fuels depends on the emissions from the vehicle's tailpipe as well as the emissions associated with production of the fuel (sometimes termed "upstream" emissions). For example, tailpipe GHG emissions from renewable natural gas are identical to tailpipe GHG emissions from conventional natural gas; the GHG benefits of renewable natural gas come from the fact that it is produced from biomass. Similarly, BEVs have zero tailpipe emissions, but properly accounting for their GHG impacts requires quantifying the emissions associated with the electricity generation needed to charge the vehicle's batteries.

Subsector

Clean Vehicles and Fuels

Locational Context

Non-applicable

Scale of Application

Project/Site or Plan/Community

Implementation Requirements

See measure description.

Cost Considerations

Capital costs to purchase cleaner fuel vehicles are high. Fueling infrastructure may be required, which will add to the upfront cost of transitioning to cleaner fuel vehicles. Fuel costs and savings compared to gasoline and diesel will vary depending on the type of fuel and market conditions. It is feasible to expect reduced fuel costs from cleaner fuels with an increased market and overall fuel cost savings over the life of the vehicle fleet.

Expanded Mitigation Options

If using electric vehicles, pair with Measure T-14 to ensure that electric vehicles have sufficient access to charging infrastructure.

GHG Reduction Formula

California has a well-defined process for quantifying the GHG emissions impacts of cleaner-fuel vehicles by virtue of the state's Low Carbon Fuel Standard (LCFS) program. An emissions calculation that considers both vehicle tailpipe and upstream fuel production emissions is sometimes referred to as a "well-to-wheels" analysis (A3 below). An emissions calculation that considers only vehicle tailpipe emissions is referred to as a "tank-to-wheels" analysis (A1 and A2 below).

The convention for project analysis under CEQA typically employs a hybrid approach. For natural gas, propane, and biofuels vehicles, the CEQA analysis quantifies only tailpipe emissions and does not seek to capture differences in emission associated with fuel production. However, for electric vehicles, CEQA analyses typically account for emissions associated with electricity generation (A1 and A2 below).

$$A1 = \mathbf{B} \times \frac{(D \times E \times F \times G) - \mathbf{C}}{\mathbf{C}}$$

$$A2 = \mathbf{B} \times \frac{(D \times E \times F \times G \times H) + \left(\mathbf{C} \times \frac{1}{I} \times (1 - H)\right) - \mathbf{C}}{\mathbf{C}}$$

$$A3 = \mathbf{B} \times \frac{J - K}{K}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A1	Percent reduction in GHG emissions from on-road vehicle emissions for BEVs	0–100	%	calculated
A2	Percent reduction in GHG emissions from on-road vehicle emissions for PHEVs	0–64	%	calculated
A3	Percent reduction in well-to-wheels GHG emissions from cleaner fuels or vehicle technologies	0–100	%	calculated
User Inputs				
B	Percent of vehicle fleet being converted to cleaner fuels	1–100	%	user input
C	Emission factor for existing (conventional fuel) vehicle	[ ]	g CO_2e per mile	CARB 2020a
Constants, Assumptions, and Available Defaults				
D	BEV efficiency	Table T-30.1	kWh per mile	see note

ID	Variable	Value	Unit	Source
E	Carbon intensity of local electricity provider	Tables E-4.3 and E-4.4	lb CO_2e per MWh	CA Utilities 2021
F	Conversion from lb to gram	454	g per lb	conversion
G	Conversion from kWh to MWh	0.001	MWh per kWh	conversion
H	Percent of PHEV miles in electric mode	46	%	CARB 2020a
I	Ratio of average hybrid vehicle mpg to comparable gasoline vehicle mpg	1.5	unitless	see below
J	Well-to-wheels emission factor for cleaner vehicle/fuel	Table T-30.2	g CO_2e per mile	CARB 2020a, 2020b, 2020c; U.S. DOE 2021
K	Well-to-wheels emission factor for existing (conventional fuel) vehicle	Table T-30.2	g CO_2e per mile	CARB 2020a, 2020b, 2020c; U.S. DOE 2021

Further explanation of key variables:

- (A1 or A2) – Use of these equations is appropriate for a typical CEQA project analysis, which considers tailpipe GHG emissions and, for electric vehicles, electricity generation emissions.
- (A3) – Use of this equation is appropriate for a user interested in a well-to-wheels analysis for all fuel types. The user should determine the appropriate emission factors for the conventional fuel and cleaner fuel.
- (C) – The user should run EMFAC to output GHG emission factors (CO_2, CH_4, and N_2O) for the existing (conventional fuel) vehicles. The EMFAC run should be based on project-specific values for the region, project year, season, vehicle category, model year, speed, and fuel type (gasoline, diesel, or a weighted average).[15] To determine the CO_2e emission factor of the conventional fuel vehicle, the emission factors for CO_2, CH_4, and N_2O from EMFAC should be multiplied by the corresponding 100-year GWP values (1, 25, and 298, respectively) from the IPCC's Fourth Assessment Report (IPCC 2007) and then summed.
- (E) – GHG intensity factors for major California electricity providers are provided in Tables E-4.3 and E-4.4. If the project study area is not serviced by a listed electricity provider, or the user is able to provide a project-specific value (i.e., for a future year not referenced in Tables E-4.3 and E-4.4), the user should use that specific value in the GHG calculation formula. If the electricity provider is not known, users may elect to use the statewide grid average carbon intensity.
- (H) – Based on the EMFAC2017 model (v1.0.3), 46 percent of miles traveled by PHEVs in California are in electric mode (eVMT), with 54 percent in gasoline mode (CARB 2020a).

[15] There are many different combinations of input variables a user could specify in EMFAC to result in a unique emission factor output. This report does not attempt to consolidate a standardized group of emission factor output into a database table for the user to refer to. It is recommended the user run EMFAC to obtain project-specific results.

- (I) – Assumes that a PHEV operating in gasoline mode is similar to a gasoline hybrid (non-plug-in) vehicle. A typical gasoline hybrid vehicle has 50 percent higher fuel economy (mpg) than a comparable gasoline vehicle, based on a comparison of the gasoline and hybrid Toyota Camry and Corolla models (U.S. DOE 2021).
- (J and K) – The average California values for fuel efficiency, energy density, and carbon intensity of typical vehicle and fuel types are provided in Table T-30.2 (CARB 2020a, 2020b, 2020c; U.S. DOE 2021). Table T-30.2 also provides the well-to-wheels emission factor, which can be calculated based on the product of the fuel efficiency, energy density, and carbon intensity. If the user can provide a project-specific value, then the user should replace in the GHG calculation formula one or more of these values that produces the emission factor.
- (D) – BEV energy efficiency varies by vehicle type. The average California values are provided in Table T-30.1 in Appendix C. If the user can provide a project-specific value, they should replace the default in the GHG reduction formula. BEV energy efficiency can be calculated as:

$$\text{BEV efficiency (kWh per mile)} = \frac{L}{M \times N}$$

Where,

  - (L) – Gasoline to electricity conversion. Users can assume 33.7 kWh per gallon of gasoline, which is a standard conversion factor used by U.S. EPA and U.S DOE (U.S. EPA 2021).
  - (M) – Fuel economy (mpg) of a comparable gasoline vehicle. Users can obtain this from Table T-30.2.
  - (N) –EER for an electric vehicle. Users can assume 3.4, which is the EER established by CARB for electric vehicles as stated in the LCFS regulation. (CARB 2020b).

GHG Calculation Caps or Maximums

Measure Maximum

($A1_{max}$) The GHG reduction from the use of BEVs is capped at 100 percent, which assumes that 100 percent of the fleet would be converted (B) and that the local electricity provider is powered 100 percent by renewables and thus has a carbon intensity of zero (E).

($A2_{max}$) The GHG reduction from the use of PHEVs is capped at 64 percent, which assumes that 100 percent of the fleet would be converted (B) and that the local electricity provider is powered 100 percent by renewables and thus has a carbon intensity of zero (E).

($A3_{max}$) For a well-to-wheels analysis, the GHG reduction from the use of electric vehicles is capped at 100 percent, which assumes that the local electricity provider is powered 100 percent by renewables and thus has a carbon intensity of zero (L). Note that the maximum percent reduction for all other cleaner vehicles and fuels presented in Table T-30.2 will not reach this maximum.

Subsector Maximum

Same as (A_{max}). Measure T-30 is the only measure at the Plan/Community scale within the Clean Vehicles and Fuels subsector.

Example GHG Reduction Quantification

The user reduces vehicle emissions by avoiding the use of conventional fuels in place of cleaner fuels or vehicle technologies. In this example, a municipality that sources their electricity from an electricity provider powered 100 percent by renewables (E) is converting half of their fleet of gasoline light duty automobiles to BEVs (B). The user has run EMFAC for their county, vehicle category, and project year, and determined the fleet emission factor to be 400 g CO_2e (C). The user would reduce GHG emissions from the existing fleet by 50 percent.

$$A1 = 50\% \times \frac{(0.33\frac{kWh}{mi} \times 0\ \frac{lb\ CO_2e}{MWh} \times 454\ \frac{g}{lb} \times 0.001\frac{MWh}{kWh}) - 400\frac{g\ CO_2e}{mi}}{400\frac{g\ CO_2e}{mi}} = -50\%$$

Quantified Co-Benefits

Improved Local Air Quality

(O1) – The use of BEVS in lieu of conventional vehicles would decrease local criteria pollutants. The percent reduction is equal to (B). Electricity supplied by statewide fossil-fueled or bioenergy power plants will generate criteria pollutants. However, because these power plants are located throughout the state or outside the state, electricity consumption from vehicles charging typically will not generate localized criteria pollutant emissions on the project site or roadways traveled by the electric vehicles.

(O2) – The percent reduction in local criteria pollutants from use of PHEVs in lieu of conventional vehicles (A2) is equal to ($B \times A2_{max}$). See ($A2_{max}$) above, which assumes (E) is set to zero to nullify eVMT activity and vehicle fleet conversion (B_{max}) is set to 100 percent. ($A2_{max}$) is multiplied by the actual conversion of the vehicle fleet (B) to adjust the percent reduction calculated from ($A2_{max}$). Electricity supplied by statewide fossil-fueled or bioenergy power plants will generate criteria pollutants. However, because these power plants are located throughout the state or outside the state, electricity consumption from vehicles charging typically will not generate localized criteria pollutant emissions.

(O3) – For a well-to-wheels analysis, the fuels produced by facilities within and outside of California will generate criteria pollutants. Because these facilities are dispersed, offsite of the project/site or plan/community, fuel production typically will not generate localized criteria pollutant emissions. Therefore, only the tank-to-wheels (i.e., tailpipe) portion of the vehicle criteria pollutant emissions should be quantified. For BEVs and PHEVs, this can be done using the methodologies described above (O1 and O2, respectively). For vehicles fueled by diesel, biodiesel,

renewable diesel, and natural gas, the criteria pollutant emission factor can be outputted by EMFAC (see C). The criteria pollutant reductions from use of gasoline hybrid or flex fuel vehicles cannot be readily quantified within EMFAC as these fuel types are not inputs the user can specify.

Fuel Savings (Increased Electricity)

(P1 and Q1) – The use of BEVs in lieu of conventional vehicles would decrease vehicle fuel consumption and increase electricity use. The percent reduction in fuel use (P1) is equal to (B). The absolute increase in electricity use can be calculated using the below formula (Q1).

(P2 and Q2) – The use of PHEVs in lieu of conventional vehicles would decrease vehicle fuel consumption and increase electricity use. The percent reduction in fuel use (P2) is equal to $(B \times A2_{max})$. The absolute increase in electricity use (Q2) is equal to $(H \times Q1)$.

(P3 and Q3) – For gasoline, gasoline hybrid, flex fuel, diesel, biodiesel, renewable diesel, and natural gas, the percent reduction in fuel use of the existing (conventional fuel) vehicle is equal to (B). The absolute increase in the cleaner fuel/vehicle energy can be calculated using the below formula (P3).

BEV Electricity Use Increase Formula

$$Q1 = B \times D \times R$$

Electricity Use Increase Calculation Variables

ID	Variable	Value	Unit	Source
Output				
Q1	Increase in electricity from electric vehicles	[ ]	kWh per year	calculated
User Inputs				
R	Average annual VMT of all vehicles in fleet	[ ]	miles per year	user input
Constants, Assumptions, and Available Defaults				
	None			

Further explanation of key variables:

- Please refer to the GHG Calculation Variables table above for definitions of variables that have been previously defined.

Cleaner Vehicle Energy Use Increase Formula

$$P3 = B \times R \times \frac{S}{T}$$

Cleaner Vehicle Energy Use Increase Variables

ID	Variable	Value	Unit	Source
Output				
P3	Increase in vehicle fuel use in fleet	[ ]	megajoules (MJ)	calculated
User Inputs				
	None			
Constants, Assumptions, and Available Defaults				
S	Energy density for cleaner fuel/vehicle	Table T-30.2	MJ per gal	CARB 2019, 2020a, 2020b, 2020c; U.S. DOE 2021
T	Fuel efficiency for cleaner fuel/vehicle	Table T-30.2	mpg	

Further explanation of key variables:

- (S and T) – The average California values for fuel efficiency and energy density of typical vehicle and fuel types are provided in Table T-30.2 (CARB 2019, 2020a, 2020b, 2020c; U.S. DOE 2021). If the user can provide a project-specific value, then the user should replace in the fuel use reduction formula one or more of these values that produces the energy consumption value (MJ).
- Please refer to the GHG Calculation Variables table above for definitions of variables that have been previously defined.

Energy

The GHG emissions from energy use come from power generation that provides the energy used to operate a building or source. Power is typically generated by either a remote, central electricity generating plant, onsite generation by fuel combustion, or onsite solar, wind, or other renewable power. Because the emissions from central electricity generation are not emitted where the electricity is being used, these types of emissions are referred to as *indirect* emissions. As such, measures that reduce electricity consumption result in reductions of criteria pollutants where the electricity is generated (i.e., power plants). Electricity-reducing measures are, therefore, not considered to result in local air quality co-benefits at the project site, although they could contribute to regional air quality improvements.

Because the emissions from onsite fuel combustion are emitted where the fuel is being consumed, these types of emissions are referred to as *direct* emission. Measures that reduce residential natural gas use (e.g., from cooktops and for space and water heating) reduce onsite fuel combustion and improve local air quality. Direct use of onsite solar or wind power generated electricity does not result in emissions.

Energy sector emissions can be reduced through energy efficiency improvements, renewable energy generation, building electrification, and CH_4 recovery and reuse at industrial facilities (landfills and wastewater treatment plants). These types of measures are discussed below. This section also provides guidance for combining emission reductions from energy measures and accounting for statewide legislation that may reduce future emissions reductions achieved by energy measures. The measure factsheets and quantification methods for individual measures follow. Use the graphic on the following page to click on an individual measure to navigate directly to the measure's factsheet.

Measures to Improve Efficiency

Energy sector emissions can be reduced by lowering the amount of electricity and natural gas required for building operations. This can be achieved by designing a more energy-efficient building structure and/or installing energy-efficient appliances.[14] Emissions reductions from energy efficiency improvements are quantified based on the amount of expected energy savings that would be achieved over existing energy codes and regulations. Existing consumption values are determined using California-specific energy end use databases, such as the California Commercial End-Use Survey and Residential Appliance Saturation Study (RASS), and other literature sources

[14] This Handbook does not account for potential "rebound effects" of energy efficiency measures. *Rebound effect* is the phenomenon that an increase in energy efficiency may lead to fewer energy savings because energy use will increase due to consumer and market responses. While rebound effects have been documented in literature, they are difficult to precisely and reliably quantify.

(e.g., ENERGY STAR program). Quantified measures that target energy efficiency improvements described in this section include Measures E-1 through E-9.

Energy

ENERGY EFFICIENCY IMPROVEMENTS

- E-1. Buildings Exceed 2019 Title 24 Building Envelope Energy Efficiency Standards
- E-2. Require Energy Efficient Appliances
- E-3-A. Require Energy Efficient Residential Boilers
- E-3-B. Require Energy Efficient Commercial Packaged Boilers
- E-4. Install Cool Roofs and/or Cool Walls in Residential Development
- E-5. Install Green Roofs in Place of Dark Roofs
- E-6. Encourage Residential Participation in Existing Demand Response Program(s)
- E-7. Require Higher Efficacy Public Street and Area Lighting
- E-8. Replace Incandescent Traffic Lights with LED Traffic Lights
- E-9. Utilize a Combined Heat and Power System

RENEWABLE ENERGY GENERATION

- E-10-A. Establish Onsite Renewable Energy Systems—Generic
- E-10-B. Establish Onsite Renewable Energy Systems—Solar Power
- E-10-C. Establish Onsite Renewable Energy Systems—Wind Power
- E-11. Procure Electricity from Lower Carbon Intensity Power Supply

BUILDING DECARBONIZATION

- E-12. Install Alternative Type of Water Heater in Place of Gas Storage Tank Heater in Residences
- E-13. Install Electric Ranges in Place of Gas Ranges
- E-14. Limit Wood Burning Devices and Natural Gas/Propane Fireplaces in Residential Development
- E-15. Require All-Electric Development
- E-16. Require Zero Net Energy Buildings
- E-17. Require Renewable-Surplus Buildings

METHANE RECOVERY

- E-18. Establish Methane Recovery in Landfills
- E-19. Establish Methane Recovery in Wastewater Treatment Plants

Measures to Increase Renewable Energy Generation

Different modes of electricity generation have different GHG emission intensities. Fossil fuel-based generation emits GHGs from fuel combustion, with the emissions quantity depending on the quantity and type of fuel used. Renewable energy generation, on the other hand, typically has significantly fewer emissions, and most types of renewable sources—such as solar photovoltaic (PV) systems—have zero associated GHG emissions. Renewable energy generation reduces emissions by avoiding an equivalent amount of grid energy. To calculate this, the amount of energy generated by the renewable system(s) must be quantified and then multiplied by the electricity provider-specific emission factor for the type of energy (e.g., electricity, natural gas) being replaced.[15] Quantified measures that target renewable energy generation described in this section include Measures E-10-A through E-11.

Measures for Building Decarbonization

Building decarbonization, also termed *beneficial electrification* or *building electrification*, involves shifting from fossil fuels (e.g., natural gas) to electricity as the power source for heating, cooking, and appliances. In a fully electrified building, gas-powered water heaters, gas-powered ovens and cooktops, gas-powered clothes washers and dryers, and space heating that normally uses natural gas, propane, or heating oil are all replaced by electric alternatives, which are usually 2 to 3 times more efficient than traditional appliances. Displacing emissions-intensive fossil fuel energy with less emissions-intensive electricity results in a net emission reduction. Further, the emission reduction increases if the electricity for these end uses is generated by solar, wind, or other sources of zero-carbon electricity. These zero-carbon sources can be provided on a project site or integrated into the local electricity providers' renewable energy mix. In future years, building decarbonization measures will become increasingly effective at reducing GHG emissions because electricity provided by retail sellers of electricity will be procured from increasing amounts of renewable energy sources.

Emissions reductions achieved through building electrification are quantified based on the direct emissions avoided by the displaced fuel plus the indirect emissions added by the increased use of electricity. To calculate this, the avoided energy (i.e., negative value) generated by the fossil-fueled appliance(s) must be quantified and then multiplied by the appropriate fuel emission factor. The additional energy (i.e., positive value) generated by the electric alternative appliance(s) must be quantified and then multiplied by the electricity provider-specific emission factor.[16] The sum of these two emissions represents the net emission reduction. Quantified

[15] The quantification methods do not account for potential future renewable energy curtailment (i.e., the deliberate reduction in power output below what could have been generated to balance supply and demand), which could reduce expected emissions savings from certain renewable energy measures.

[16] One method for determining energy consumption for an electric alternative appliance is to convert the natural gas consumption, typically measured in therms, into British thermal units, which can then be converted into the electricity energy consumption metric of kWh. However, this method does not account for the differing energy efficiencies of natural gas versus electricity or potential differences in the technical specifications of the associated appliances. Accordingly, the Handbook does not use this basic conversion method. Instead, the Handbook recommends using actual reported energy consumption for electric alternative appliances.

measures that target building decarbonization described in this section include Measures E-12 through E-17.

Measures for Methane Recovery

Decomposition of waste and organic material in landfills and at wastewater treatment facilities generates CH_4. Capturing CH_4 through recovery systems directly reduces GHG emissions. Additional reductions can be achieved if the captured CH_4 is combusted to generate electricity for onsite energy needs, which displaces the associated indirect GHG emissions from electricity production. Emissions reductions from CH_4 recovery systems that include electricity generation are quantified using similar methods as described above for measures to increase renewable energy generation. Quantified measures that target CH_4 recovery described in this section include Measures E-18 and E-19.

Combining Emissions Reductions from Energy Measures

The total reductions claimed by a user for energy measures should not exceed 100 percent of project energy emissions, unless a measure would result in additional excess energy capacity that would be sold to an electricity provider or other project. This may include renewable energy generation systems tied into the grid. These additional emission reductions may be used to offset other categories of emissions, with approval of the agency reviewing the project. In these cases of excess capacity, the quantified excess emissions must be carefully verified to ensure that any credit allowed for these additional reductions is truly additional.[17]

Reduced Effectiveness of Energy Measures in Future Years

Senate Bill 100 requires that 100 percent of electricity supplied to California end-use customers be from eligible renewable energy resources and zero-carbon resources by 2045. As retail sellers of electricity procure increasing amounts of renewable energy to displace fossil fuels in their energy generation mix, the emission factors of local electricity providers will decrease over time. Because some energy measures reduce electricity consumption or displace grid energy, the annual GHG reduction from these measures will be less in future years. As noted above, however, the shift to a larger portfolio of renewable energy will make building decarbonization measures more effective. Further, if the local electricity provider for a project already has carbon-free electricity, then energy reduction measures would not reduce electricity emissions as they would already be zero or near zero.[18] Users should take care to appropriately account for this possibility by using the electricity provider-specific, year-specific emission factors presented in Tables E-4.3 and E-4.4 in Appendix C, *Emissions Factors and Data Tables*.[19]

Similarly, measures that reduce building energy consumption may become less effective over time because of increasingly stringent Title 24, California Building Standards Code, standards.

---

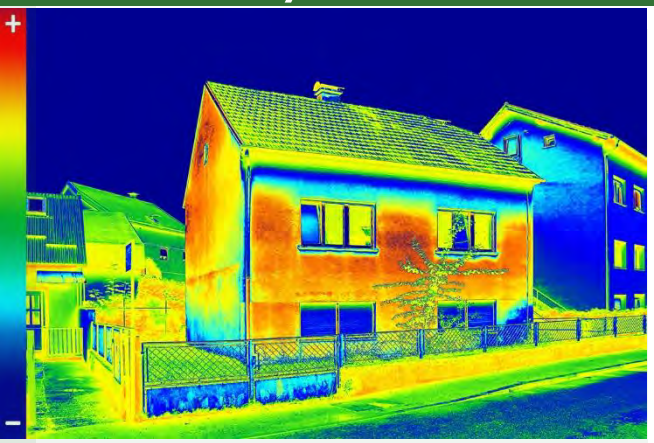
[17] For more detailed information on offset verification protocols visit https://www.climateactionreserve.org/how/future-protocol-development/criteria/.

[18] Senate Bill 100 requires 100 percent renewable for retail sales but not for all power generation/supply (e.g., grid balancing or in-facility usage). Thus, emission factors may not be exactly zero by 2045.

[19] The default electricity provider emission factors reflect the annual average emissions intensity of delivered electricity. Depending on the time of day and load, measures that reduce electricity consumption may offset emissions from marginal power sources, yielding greater emissions reductions than estimated when using average annual emission factors.

Strengthening of Title 24 requirements, including provisions for zero net energy (ZNE) buildings (i.e., energy efficiency improvements and onsite renewable energy), will improve energy efficiency and reduce energy consumption in new construction. The quantification methods presented in this report include measures that exceed minimum regulatory requirements of the 2019 Title 24 standards. Some measures in this Handbook may become obsolete if they are made mandatory for all new buildings as part of future Title 24 standards. As such, users should take care to determine whether the measures in this Handbook still exceed the Title 24 requirements at the time of project implementation. If the user's project exceeds the requirements of Title 24, then they can take credit for the resulting reductions.

E-1. Exceed 2019 Title 24 Building Envelope Energy Efficiency Standards



GHG Mitigation Potential

Up to 99% of GHG emissions from building electricity and/or natural gas use

Co-Benefits (icon key on pg. 34)

Climate Resilience

Increased energy efficiency can reduce the strain on the overall grid, particularly the risk of power outages during peak loads. Increased efficiency can also reduce energy costs, particularly if extreme heat would otherwise increase these costs.

Health and Equity Considerations

More energy efficient buildings can help residents to save money on utility costs and reduce exposure to extreme heat, supporting greater resilience to climate health impacts. This can be especially critical for low-income and vulnerable residents.

Measure Description

This measure requires new buildings to exceed the energy efficiency requirements of the building energy standards of the 2019 version of Title 24. GHGs are emitted because of activities in residential and commercial buildings that use electricity and natural gas as energy sources. By committing to a percent improvement over Title 24, the building's energy use is reduced, thereby reducing GHG emissions. Title 24 Part 6 regulates energy uses including space heating and cooling, hot water heating, ventilation, and integrated lighting. End use categories not subject to Title 24 requirements include appliances, electronics, and miscellaneous "plug-in" uses.

Subsector

Energy Efficiency Improvements

Scale of Application

Project/Site

Implementation Requirements

Reduce energy use from any of the following end uses: space heating and cooling, hot water heating, ventilation, and integrated lighting.

Cost Considerations

In order to make buildings even more energy efficient, developers will face greater upfront costs to purchase higher-quality materials, which may be passed on to the property owner. However, property owners will realize cost savings from reduced energy use. Property owners will also avoid potential retrofitting costs in the future if efficiency standards are made more stringent.

Expanded Mitigation Options

Pair with Measure E-2, *Require Energy Efficient Appliances*, to reduce energy use from both end use categories that are subject to Title 24 requirements and those that are not to yield increased GHG reductions.

GHG Reduction Formula

$$A = -C \times E$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from building electricity and/or natural gas consumption	[ ]	0–99%	calculated
User Inputs				
B	Building/housing type	[ ]	text	user input
C	Percent improvement beyond 2019 Title 24	0–100	% expressed as a whole number	user input
Constants, Assumptions, and Available Defaults				
D	Electricity Demand Forecast Zone	Figure E-1.1 Table E-1.1	integer	CEC 2017
E	Percent reduction in building electricity or natural gas consumption for 1% improvement over 2019 Title 24 Standards	Tables E-1.2 through Table E-1.5	%	CEC 2020, 2021

Further explanation of key variables:

- (A) – The output provides the percent reduction in GHG emissions from either building electricity or natural gas consumption, depending on which energy source the user is interested in calculating (E). To determine the percent reduction in GHG emissions from building energy (i.e., electricity plus natural gas), the user would need to know the percent of total GHG emissions from each energy source. For example, if 40 percent of building energy emissions come from electricity and 60 percent come from natural gas consumption, the percent reduction in GHG emissions from building energy could be calculated as follows.

  $$A_{energy} = (40\% \times A_{electricity}) + (60\% \times A_{natural\ gas})$$

  Further, to determine the percent reduction in GHG emissions for a project with multiple buildings, the user would need to know the percent of total building energy emissions from each building. For example, if 67 percent of building energy emissions come from Building 1 and 33 percent come from Building 2, the percent reduction in GHG emissions from all building energy could be calculated as follows.

  $$A_{energy_total} = (67\% \times A_{energy_1}) `+ (33\% \times A_{energy_2})$$

- (B) – The building and housing types are needed to lookup the percent reduction in electricity or natural gas consumption over 2019 Title 24 Standards (E).
- (D) – The California Energy Commission (CEC) has specified 28 distinct Electricity Demand Forecast Zones (EDFZs) in California. Users should refer to Figure E-1.1 in

Appendix C to determine the EDFZ for their project. This measure relies on energy consumption data from the year 2019 tied to the CEC's 2018-2030 Uncalibrated Commercial Sector Forecast (Commercial Forecast) and the 2019 RASS (CEC 2020, 2021). Because data from all 28 EDFZs are not included in the Commercial Forecast and RASS, representative data from similar EDFZs may need to be used. Users should refer to Table E-1.1 for the proxy EDFZ that corresponds with those listed in Tables E-1.2 through E-1.5.

- (E) – See Tables E-1.2 through E-1.5 for the percent reduction in building electricity and natural consumption by EDFZ and land use type. There are two tables for residential land uses and two for non-residential land uses. This information is based on the percent of total building energy that comes from end use categories subject to Title 24 requirements (e.g., space heating and cooling, hot water heating, ventilation) (CEC 2020, 2021).[20, 21] For example, for a general office building in EDFZ 1, 65 percent of electricity and 79 percent of natural gas consumption come from end use categories subject to Title 24 requirements. Thus, a 1 percent improvement in building energy efficiency standards results in a 0.65 percent reduction in electricity use and a 0.79 percent reduction in natural gas consumption.

GHG Calculation Caps or Maximums

Measure Maximum

(C_{max}) The percent improvement beyond 2019 Title 24 standards is capped at 100.

It is assumed that the energy demand of the user's project is currently being met by grid electricity that requires *some* amount of fossil fuel–based energy generation and/or onsite natural gas, both of which emit GHGs from fuel combustion. In other words, the local electricity provider has an energy intensity factor (lb of CO_2e per MWh) greater than zero and/or the project consumes natural gas onsite for building energy. For all-electric projects that are served by electricity providers already with a renewable portfolio of 100 percent, this measure could have no reduction in GHG emissions. If the electricity provider is using renewable energy credits (REC) to meet a 100 percent renewable portfolio goal, then some emissions reductions may be achieved. This measure would still result in the co-benefits of reduced electricity use and enhanced energy security.

Mutually Exclusive Measures

If the user selects Measure E-15, *Require All-Electric Development*, they may not also take credit for any natural gas–related efficiency gains under this measure. In other words, ($A_{natural\ gas}$) should be zeroed out in the above equation.

Example GHG Reduction Quantification

The user reduces building energy by exceeding energy efficiency standards. In this example, the user commits to a 10 percent improvement over 2019 Title 24 requirements (C) for

[20] End use categories not subject to Title 24 requirements include appliances, electronics, and miscellaneous "plug-in" uses.
[21] Hardwired lighting is part of Title 24 Part 6. However, it is not part of the building envelope energy and, therefore, not considered as part of this measure.

their project located in EDFZ 3 (D). The project includes Building 1, a day-care center, and Building 2, apartments (mid-rise) (B). The user would reduce GHG emissions from the day-care center from electricity and natural gas by 8.1 percent and 9.9 percent, respectively. GHG emissions from the apartment from electricity and natural gas would be reduced by 2.4 percent and 9.5 percent, respectively.

$A_{electricity_1} = -10 \times 0.81\% = -8.1\%$ day care electricity emissions

$A_{natural\ gas_1} = -10 \times 0.99\% = -9.9\%$ day care natural gas emissions

$A_{electricity_2} = -10 \times 0.24\% = -2.4\%$ apartment electricity emissions

$A_{natural\ gas_2} = -10 \times 0.95\% = -9.5\%$ apartment natural gas emissions

The percent reduction in GHG emissions from building energy (i.e., electricity plus natural gas) per building can also be calculated if the user knows the percent of total GHG emissions from each energy source. In this example, 40 percent of the day-care building's energy emissions come from electricity and 60 percent come from natural gas consumption, while 45 percent of the apartment building's energy emissions come from electricity and 55 percent come from natural gas consumption. Energy sector GHG emissions from the day-care and apartment would be reduced by 9.2 percent and 6.3 percent, respectively.

$A_{energy_1} = (40\% \times -8.1\%) + (60\% \times -9.9\%) = -9.2\%$ day care energy emissions

$A_{energy_2} = (45\% \times -2.4\%) + (55\% \times -9.5\%) = -6.3\%$ apartment energy emissions

Further, the percent reduction in GHG emissions for the project can be calculated if the user knows the percent of total building energy emissions from each building. In this example, 33 percent of building energy emissions come from the day-care and 67 percent come from the apartment. The percent reduction in GHG emissions from all building energy would be 7.9 percent.

$A_{energy_total} = (33\% \times -9.2\%) + (77\% \times -6.3\%) = -7.9\%$ building energy emissions

Quantified Co-Benefits

Improved Air Quality

Electricity supplied by statewide fossil-fueled or bioenergy power plants generates criteria pollutants. However, because these power plants are located throughout the state, the reduction in electricity use from this measure will not reduce localized criteria pollutant emissions at the project site.

The reduction in natural gas consumption from this measure would result in local improvements in air quality because the building natural gas combustion regulated under Title 24 Part 6 occurs on the project site (e.g., space heating, water heating).

The percent reduction in criteria pollutants from natural gas ($A_{naturalgas}$) is the same as the percent reduction in building natural gas consumption achieved by the measure.

Energy and Fuel Savings

The percent reduction in electricity use achieved by the measure is the same as the percent reduction in GHG emissions from electricity ($A_{electricity}$). The percent reduction in natural gas consumption achieved by the measure is the same as the percent reduction in GHG emissions from natural gas ($A_{naturalgas}$).

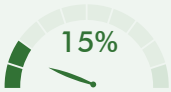
E-2. Require Energy Efficient Appliances

GHG Mitigation Potential



Up to 15.0% of GHG emissions from building electricity

Co-Benefits (icon key on pg. 34)

Climate Resilience

Increased energy efficiency can reduce the strain on the overall grid, particularly the risk of power outages during peak loads. Increased efficiency can also reduce energy costs, particularly if extreme heat would otherwise increase these costs.

Health and Equity Considerations

The use of ENERGY STAR appliances can increase upfront purchase costs; thus, it should be clearly explained to occupants or buyers that these costs can be offset by reduced operational utility costs. This can be particularly beneficial for low-income residents.

Measure Description

This measure will require installation of ENERGY STAR-certified appliances that exceed the energy efficiency of conventional appliances. By committing to more efficient appliances, the building's energy use is reduced, thereby reducing GHG emissions.

Subsector

Energy Efficiency Improvements

Scale of Application

Project/Site

Implementation Requirements

This measure can be used for commercial refrigerators. It can also be used for residential refrigerators, clothes washers, dishwashers, and ceiling fans. This measure will only result in reductions associated with electricity use and does not apply to natural gas as no ENERGY STAR appliances that use natural gas were evaluated.

Cost Considerations

More energy-efficient appliances are typically more expensive than less efficient ones, leading to greater upfront costs. However, the replacement of less efficient appliances with more efficient models reduces energy consumption and thereby reduces long-term energy costs.

Expanded Mitigation Options

Pair with Measure E-1, *Exceed Title 24 Building Envelope Energy Efficiency Standards*, to reduce energy use from both end use categories subject to Title 24 requirements and those that are not to yield increased GHG reductions.

GHG Reduction Formula

$$A = (E_1 \times F_1) + (E_2 \times F_2) + (E_3 \times F_3) + (E_4 \times F_4)$$

GHG Calculation Variables

Further explanation of key variables:

- (A) – The output provides the percent reduction in GHG emissions from building electricity. To determine the percent reduction in GHG emissions from building energy (i.e., electricity plus natural gas), the user would need to know the percent of total GHG emissions from electricity. For example, if 40 percent of building energy emissions come from electricity, the percent reduction in GHG emissions from building energy could be calculated as follows.

  $$A_{energy} = (40\% \times A_{electricity})$$

  Further, to determine the percent reduction in GHG emissions for a project with multiple buildings, the user would need to know the percent of total building energy emissions from each building. For example, if 67 percent of building energy emissions come from Building 1 and 33 percent come from Building 2, the percent reduction in GHG emissions from all building energy could be calculated as follows.

  $$A_{energy_total} = (67\% \times A_{energy_1}) + (33\% \times A_{energy_2})$$

- (B) – The building and housing types are needed to lookup the percent of total building electricity by appliance (F). Commercial refrigerators were evaluated for the non-residential building types of grocery stores, restaurants, and refrigerated warehouses. Residential refrigerators, clothes washers, dishwashers, and ceiling fans were evaluated for all residential housing types.
- (D) – The CEC has specified 28 distinct EDFZs in California. Users should refer to Figure E-1.1 in Appendix C to determine the EDFZ for their project. This measure relies

on energy consumption data from the year 2019 tied to the CEC's Commercial Forecast and the 2019 RASS (CEC 2020, 2021). Because data from all 28 EDFZs are not included in the Commercial Forecast and RASS, representative data from similar EDFZs may need to be used. Users should refer to Table E-1.1 for the proxy EDFZ that corresponds with those listed in Table E-2.2 and Table E-2.3.

- (E) – See Table E-2.1 for the percent reduction in ENERGY STAR appliance electricity use compared to conventional appliances that meet the minimum federal efficiency standards (ENERGY STAR 2014; 2016; 2017; 2018a; 2018b).
- (F) – See Table E-2.2 and Table E-2.3 for the percent of total building electricity by appliance. There is one table for residential land uses and another for non-residential land uses. This information, excluding ceiling fans, is primarily based on data from the CEC (2020, 2021). RASS does not specify a ceiling fan end-use; rather, electricity use from ceiling fans is accounted for in the Miscellaneous category, which includes interior lighting, attic fans, and other miscellaneous plug-in loads. Because the electricity usage of ceiling fans alone is not specified, a value from a National Renewable Energy Laboratory (NREL) study is used. The study reports that the average energy use per ceiling fan is 84.1 kWh per year (NREL 2008). In this measure, it is assumed that each multi-family, single-family, and townhome residence has one ceiling fan. The electricity savings shown here are based on installing an ENERGY STAR ceiling fan and do not account for an occupant's decreased use of cooling devices such as air conditioners.

GHG Calculation Caps or Maximums

It is assumed that the electricity demand of the project's appliances is currently being met by grid electricity that requires *some* amount of fossil fuel–based energy generation, which emits GHGs from fuel combustion. In other words, the local electricity provider has an energy intensity factor (lb of CO_2e per MWh) greater than zero. For projects that are served by electricity providers already with a renewable portfolio of 100 percent, this measure could have no reduction in GHG emissions. If the electricity provider is using REC to meet a 100 percent renewable portfolio goal, then some emissions reductions may be achieved. This measure would still result in the co-benefits of reduced electricity use and enhanced energy security.

Example GHG Reduction Quantification

The user reduces building energy by requiring the builder supply appliances that exceed the energy efficiency of conventional appliances. In this example, the user's project includes Building 1, a supermarket, and Building 2, single-family home (B) located in EDFZ 1 (D). The user would commit to ENERGY STAR commercial refrigerators in the grocery store and ENERGY STAR residential refrigerators, clothes washers, dishwashers, and ceiling fans in the single-family housing (C). GHG emissions from the supermarket and single-family home from electricity would be reduced by 4.6 percent and 2.8 percent, respectively.

$A_{electricity_1} = -20\% \times 23\% = -4.6\%$ supermarket electricity emissions

$A_{electricity_2} = (-9\% \times 18\%) + (-25\% \times 1.1\%) + (-12\% \times 1.1\%) + (-60\% \times 1.3\%) = -2.8\%$ housing electricity emissions

The percent reduction in GHG emissions from building energy (i.e., electricity plus natural gas) per building can also be calculated if the user knows the percent of total GHG emissions from each energy source. In this example, 60 percent of the supermarket's energy emissions come from electricity and 50 percent of the single-family home's energy emissions come from electricity. GHG emissions from the supermarket and single-family home would be reduced by 2.8 percent and 1.4 percent, respectively.

$A_{energy_1} = (60\% \times -4.6\%) = -2.8\%$ supermarket energy emissions

$A_{energy_2} = (50\% \times -2.8\%) = -1.4\%$ housing energy emissions

Further, the percent reduction in GHG emissions for the project can be calculated if the user knows the percent of total building energy emissions from each building. In this example, 67 percent of building energy emissions come from the supermarket and 33 percent come from the single-family home. The percent reduction in GHG emissions from all building energy would be 2.3 percent.

$A_{energy_total} = (67\% \times -2.8\%) + (33\% \times -1.4\%) = -2.3\%$ building energy emissions

Quantified Co-Benefits

Energy and Fuel Savings

The percent reduction in electricity use achieved by the measure is the same as the percent reduction in GHG emissions from electricity ($A_{electricity}$).

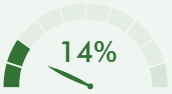
E-3-A. Require Energy Efficient Residential Boilers

GHG Mitigation Potential



Up to 14.0 % of GHG emissions from boiler fuel consumption

Co-Benefits (icon key on pg. 34)

Climate Resilience

If the boilers are electric, increased energy efficiency can reduce the strain on the overall grid, particularly the risk of power outages during peak loads. Increased efficiency can also reduce energy costs.

Health and Equity Considerations

If the boilers use natural gas, propane, or home heat oil, a more efficient model can directly reduce fuel combustion in the home and thus help reduce indoor air pollution, supporting improvements to public health.

Measure Description

This measure requires installation of a residential boiler with a higher energy efficiency than what is required by regulation. Improving boiler efficiency decreases fuel consumption for the same amount of energy output, thereby reducing associated GHG emissions.

Subsector

Energy Efficiency Improvements

Scale of Application

Project/Site

Implementation Requirements

This measure is only appropriate for residential boilers. A *residential boiler*, as defined in the Code of Federal Regulations (C.F.R.), means a product that utilizes only single-phase electric current, or single-phase electric current or DC current in conjunction with natural gas, propane, or home heating oil and that (1) is designed to be the principal heating source for the living space of residence; and (2) has a heat input rate of less than 300,000 British Thermal Units (Btus) per hour.

Cost Considerations

More energy-efficient boilers are typically more expensive than less efficient ones, leading to greater upfront costs. However, the use of more efficient models reduces energy consumption and thereby reduces long-term energy costs. Boilers with improved insulation—a metric in improved energy efficiency—are also less likely to freeze and burst, potentially avoiding cold weather repair costs and water damage.

Expanded Mitigation Options

Pair with Measure E-12, *Install Alternative Type of Water Heater in Place of Gas Storage Tank Heater in Residences*, to reduce energy use from both space heating and water heating to yield increased GHG reductions.

GHG Reduction Formula

A = D

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from boiler fuel consumption	1.2–14.0	%	calculated
User Inputs				
B	Boiler type	[ ]	text	user input
C	Annual fuel utilization efficiency of boiler with measure	83–96	%	user input
Constants, Assumptions, and Available Defaults				
D	Boiler fuel savings with measure compared to minimum requirement	Table E-3-A.1	%	U.S. DOE 2015

Further explanation of key variables:

- (C) – The U.S. Department of Energy's (U.S. DOE) 2016 Conservation Standards for Residential Boilers (10 C.F.R. 430) set increased energy efficiency requirements for residential boilers, effective January 2021. The annual fuel utilization efficiency (AFUE) is a common metric for determining residential boiler efficiency as it represents the ratio of the total useful heat delivered to the heat value from the annual amount of fuel consumed. The project boiler AFUE must exceed the minimum AFUE required by the standards to result in GHG emission reductions. Boiler efficiency should be obtainable from manufacturer specifications.
- (D) – The U.S. DOE calculated the average annual fuel use and savings of boilers at various AFUEs above the minimum requirement of the standards based on historical consumption data. This information is summarized in Table E-3-A.1 in Appendix C.

GHG Calculation Caps or Maximums

Measure Maximum

(C_{max}) The annual fuel utilization efficiency of the proposed boiler is capped at the "Max Tech" percentage for each boiler type, which is presented in Table E-3-A.1 in Appendix C.

Mutually Exclusive Measures

If the user selects Measure E-15, *Require All-Electric Development*, the user cannot also select this measure, given that it calls for use of gas- and oil-fired boilers.

Example GHG Reduction Quantification

The user reduces boiler fuel use by requiring installation of a boiler with a higher AFUE than what is required by the 2016 Conservation Standards for Residential Boilers. If the boiler is a gas-fired hot water boiler (B) with an AFUE of 96 percent (C), the user would reduce GHG emissions from boiler fuel consumption by 14 percent based on Table E-3-A.1 in Appendix C.

A = -14%

Quantified Co-Benefits

Improved Air Quality

The reduction in fuel consumption (i.e., natural gas or oil) from this measure would result in local improvements in air quality because pollutants from fuel consumption would be reduced at the project site. The percent reduction in GHG emissions (A) is the same as the percent reduction in criteria pollutant emissions achieved by the measure.

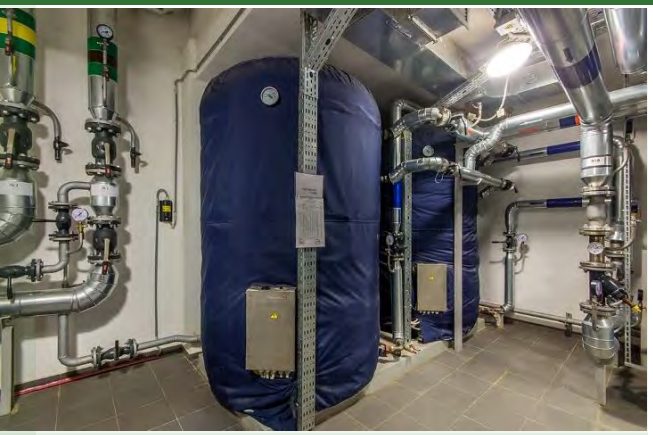
Energy and Fuel Savings

The percent reduction in fuel consumption achieved by the measure is the same as the percent reduction in GHG emissions (A).

Sources

Available: https://www.regulations.gov/docketBrowser?rpp=25&so=DESC&sb=commentDueDate&po=0&dct=SR%2BO&D=EERE-2012-BT-STD-0047. Accessed: January 2021.

E-3-B. Require Energy Efficient Commercial Packaged Boilers



GHG Mitigation Potential

Up to 16.0% of GHG emissions from boiler fuel consumption

Co-Benefits (icon key on pg. 34)

Climate Resilience

Increased energy efficiency can reduce the strain on the overall grid, particularly the risk of power outages during peak loads. Increased efficiency can also reduce energy costs.

Health and Equity Considerations

Reduction of fuel combustion in commercial spaces can help reduce indoor pollution.

Measure Description

This measure requires installation of a commercial packaged boiler with a higher energy efficiency than what is required by regulation. Improving boiler efficiency decreases fuel consumption for the same amount of energy output, thereby reducing associated GHG emissions.

Subsector

Energy Efficiency Improvements

Scale of Application

Project/Site

Implementation Requirements

This measure is only appropriate for a *commercial packaged boiler*, which, as defined in the C.F.R., means a type of packaged low pressure boiler that is industrial equipment with a capacity (rated maximum input) of 300,000 Btus per hour or more, which, to any significant extent, is distributed in commerce (1) for heating or space conditioning applications in buildings, or (2) for service water heating in buildings, but does not meet the definition of *hot water supply boiler* (as defined in 10 C.F.R. 431).

Cost Considerations

More energy-efficient boilers are typically more expensive than less efficient ones, leading to greater upfront costs. However, the replacement of less efficient boilers with more efficient models reduces energy consumption and thereby reduces long-term energy costs.

Expanded Mitigation Options

Non-applicable.

GHG Reduction Formula

A = D

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from boiler fuel consumption	1.1–16.0	%	calculated
User Inputs				
B	Boiler type	[ ]	text	user input
C	Thermal or combustion efficiency of boiler with measure	83–99	%	user input
Constants, Assumptions, and Available Defaults				
D	Boiler fuel savings with measure compared to minimum requirement	Table E-3-B.1 Table E-3-B.2	%	U.S. DOE 2016

Further explanation of key variables:

- (C) –U.S. DOE's Conservation Standards for Commercial Packaged Boilers (10 C.F.R. 431) were amended in July 2009 to set increased energy efficiency requirements for commercial packaged boilers installed after March 2012. In March 2020, U.S. DOE increased the standards, which will affect boilers installed after January 10, 2023. The minimum thermal efficiency (TE) and combustion efficiency (CE) are the metrics for determining commercial packaged boiler efficiency. TE is the ratio of the heat energy absorbed by the water to the heat energy available in the fuel burned. CE is the ratio of heat energy released by the fuel to the heat energy available in the fuel burned. The project boiler TE or CE must exceed the minimum required by the standards to result in GHG emission reductions. Boiler efficiency should be obtainable from manufacturer specifications.
- (D) – U.S. DOE calculated the average annual fuel use and savings of boilers at various TEs and CEs above the minimum requirement of the 2009 and 2020 standards based on historical consumption data. If the proposed boiler would be installed before January 10, 2023, the user should reference the annual fuel savings relative to the 2009 standards, summarized in Table E-3-B.1 in Appendix C. If the proposed boiler would be installed after January 10, 2023, the user should reference the annual fuel savings relative to the 2020 standards, summarized in Table E-3-B.2 in Appendix C.

GHG Calculation Caps or Maximums

Measure Maximum

(C_{max}) The TE or CE of the proposed boiler is capped at the "Max Tech" percentage for each boiler type, which is presented in Tables E-3-B.1 and E-3-B.2 in Appendix C.

Mutually Exclusive Measures

If the user selects Measure E-15, *Require All-Electric Development*, the user cannot also select this measure, given that it calls for use of gas- and oil-fired boilers.

Example GHG Reduction Quantification

The user reduces boiler fuel use by requiring installation of a boiler with a higher CE or TE than what is required by the 2009 or 2020 Conservation Standards for Commercial Packaged Boilers. If the proposed boiler is a 350,000 Btu/hour gas-fired hot water boiler installed in 2022 (B) with a TE of 99 percent (C), the user would reduce GHG emissions from boiler fuel consumption by 16 percent based on Table E-3-B.1 in Appendix C.

A = -16%

Quantified Co-Benefits

Improved Air Quality

The reduction in fuel consumption (i.e., natural gas or oil) from this measure would result in local improvements in air quality, because pollutants from fuel consumption would be reduced at the project site. The percent reduction in GHG emissions (A) is the same as the percent reduction in criteria pollutant emissions achieved by the measure.

Energy and Fuel Savings

The percent reduction in fuel consumption achieved by the measure is the same as the percent reduction in GHG emissions (A).

Sources

- U.S. Department of Energy (U.S. DOE). 2016. *Technical Support Document: Energy Efficiency Program for Consumer Products and Commercial and Industrial Equipment: Commercial Packaged Boilers*. December. Available: https://www.regulations.gov/docket?D=EERE-2013-BT-STD-0030. Accessed: January 2021.

E-4. Install Cool Roofs and/or Cool Walls in Residential Development

GHG Mitigation Potential

Potentially small reduction in GHG from building energy use

Co-Benefits (icon key on pg. 34)

Climate Resilience

Cool roofs and walls absorb less heat and keep buildings cool, increasing the building's adaptive capacity to extreme heat. This also reduces the strain on the electric grid, particularly the risk of power outages during peak loads, and can reduce energy costs. If implemented across a development or throughout a community, cool roofs and walls can reduce the urban heat island effect, building not just individual but also communitywide resilience to extreme heat.

Health and Equity Considerations

Cool roofs and walls can protect the health of vulnerable and low-income residents during heat waves and extreme heat days. In colder climate zones, cool roofs and walls can potentially increase winter heating costs, but the increase may be offset by reduced electricity bills in summer.

Measure Description

This measure will install cool roofs and/or walls in place of dark roofs and/or conventional walls for residential development. Cool roofs have been designed to reflect more sunlight and absorb less heat than a standard roof, keeping buildings cooler in the summertime and thus reducing air-conditioning loads. Complementary to cool roofs, cool walls achieve a similar result through using more reflective paints or materials. This reduces the electricity needed to provide cooling but can potentially increase the energy needed to provide winter heating, thereby reducing associated GHG emissions depending on the project parameters (e.g., climate, level of implementation, carbon intensity of local electricity provider). However, the winter heating penalty may be small with lower levels of winter sunlight due to shorter daylight hours and more overcast skies.

Subsector

Energy Efficiency Improvements

Scale of Application

Project/Site

Implementation Requirements

Cool roofs can be made of tiles, shingles, coatings, membranes, or metal, among other materials, in a wide range of colors (not just white). Similarly, cool wall paints and materials come in a range of colors, though light-colored paints have the greatest cooling effect. To apply the effectiveness reported by the literature, the albedo of the proposed surface must be at least 0.25 for walls and at least 0.4 for roofs.

Cost Considerations

Installing cool roofs and walls leads to substantial cost savings for relatively low additional input costs. Low-effort residential maintenance options, like painting walls with light-colored or more reflective paint, cost about the same as darker paint colors, and yet immediately reduce the cost of cooling the building. Cool roofs can have higher initial costs, depending on the material chosen, but these costs can be offset by lifetime energy savings.

Expanded Mitigation Options

Pair with Measure E-21, *Install Cool Pavements*, in Table 3-2 to adopt cool pavements. This measure could also be paired Measure E-15, *Require All-Electric Development*, to eliminate the implementation disbenefit of worsened air quality, further discussed below under *Quantified Co-Benefits*.

GHG Reduction Formula

$$H_T = H_N + H_S + H_E + H_W$$

$$L_T = \sum L_z \times \frac{H_z}{H_T}$$

$$A = [((I_R \times G_R \times H_R) + (I_T \times L_T \times H_T)) \times M \times O \times Q \times R]$$

$$-[((J_R \times G_R \times H_R) + (J_T \times L_T \times H_T)) \times N \times P \times Q \times R]$$

GHG Calculation Variables

Many of the values for the variables in this equation can be obtained from the Lawrence Berkeley National Laboratory's Cool Surface Savings Explorer (Explorer) (Levinson et al. 2019). The Explorer is an Excel tool that parses a database containing the results of whole-building model simulations that calculate the building energy changes from the use of cool walls and cool roofs under various scenarios for different building types in California.

ID	Variable	Value	Unit	Source
Output				
A	Reduction in GHG emissions from building energy	[ ]	MT CO_2e per year	calculated
L_T	Composite solar availability factor of non-roof building sides to be cooled	[ ]	unitless	calculated
H_T	Total area of non-roof building sides to be cooled (N+S+E+W)	[ ]	KSF	calculated
User Inputs				
B	Building type	[ ]	text	user input
C	Building climate zone	1–16	integer	user input
D	Building orientation	[ ]	text	user input
E	Building side(s) to be cooled (N, S, E, W & roof)	[ ]	text	user input
F	Albedo of cool surface(s)	0.25–0.60	unitless	user input
G_R	Coverage of cool roof material	0–100	%	user input
H_z	Coverage of cool building side z (N, S, E, W, R [roof])	[ ]	KSF	user input
Constants, Assumptions, and Available Defaults				
I_R	Change in natural gas use of building (roof only)	Savings Explorer	therm per year per m^2	Levinson et al. 2019
I_T	Change in natural gas use of non-roof building sides (N+S+E+W)	Savings Explorer	therm per year per m^2	Levinson et al. 2019

ID	Variable	Value	Unit	Source
J_R	Change in electricity use of building (roof only)	Savings Explorer	kWh per year per m^2	Levinson et al. 2019
J_T	Change in electricity use of non-roof building sides (N+S+E+W)	Savings Explorer	kWh per year per m^2	Levinson et al. 2019
K_z	Wall canyon aspect ratio of building side z (N, S, E, W)	Table E-4.1	unitless	Levinson 2019
L_z	Solar availability factor of building side z (N, S, E, W)	Table E-4.2	unitless	Levinson 2019
M	Carbon intensity of residential natural gas	117	lb CO_2e per MMBtu	U.S. EPA 2020
N	Carbon intensity of local electricity provider	Tables E-4.3 and E-4.4	lb CO_2e per MWh	CA Utilities 2021
O	Conversion from therm to MMBtu	0.1	MMBtu per therm	conversion
P	Conversion from kWh to MWh	0.001	MWh per kWh	conversion
Q	Conversion from lb to MT	0.000454	MT per lb	conversion
R	Conversion from KSF to m^2	92.9	m^2 per KSF	conversion

Further explanation of key variables:

- (B) – The building type is needed to run the Explorer, further discussed under (I). The Explorer provides two types of residential buildings and eight types of commercial buildings.
- (C) – Climate zones are specific geographic areas of similar climatic characteristics, including temperature, weather, and other factors that affect building energy use. The CEC has specified numerous EDFZs in California, which are referenced in CEC's Commercial Forecast and RASS. Note that this measure references the 16 building climate zones (BCZs) that were developed for Title 24 Standards and differ from the EDFZs. Users should ensure that they are selecting the appropriate BCZ by referring to Figure E-4.1 in Appendix C (CEC 2020). Alternatively, users can search for the appropriate BCZ by looking up the project address or zip code in the CEC's web-based interactive map (CEC 2018). The BCZ is needed to run the Explorer, further discussed under (I).
- (D) – The building orientation is needed to run the Explorer, further discussed under (I). Building orientation refers to whether the building's longer axis runs east-west or north south.
- (E) – The building side(s) to be cooled is needed to run the Explorer, further discussed under (I). The Explorer provides 16 combinations of sides for the user to choose from. Note that the user cannot select roof at the same time as a wall, so the Explorer will need to be run twice for projects that include both cool walls and cool roofs.
- (F) – The albedo of the cool surface is needed to run the Explorer, further discussed under (I). The energy changes outputted by the Explorer are based on a scenario of a roof with an aged roof albedo of 0.10 and walls with an aged albedo of 0.25. The Explorer provides several options for modified albedo: walls = 0.4, 0.6; roofs = 0.25,

0.4, and 0.6. Users should exercise caution in interpreting their results if the project would have different albedos than provided.

- (G_R) – The coverage of the cool roof material represents the percent of the roof area that is a cool roof.
- (H_Z) – The area of building side to be cooled represents the area of the building side minus any area that would not be covered in cool materials.
- (I_R, I_T, J_R and J_T) –The change in annual building electricity use and natural gas consumption per square meter of building surface modified can be obtained from the Explorer. Increased cool surfaces would result in a heating penalty (i.e., increase in gas consumption to heat the building and, for select commercial buildings, any electricity that provides auxiliary heat) and a cooling savings (i.e., decrease in electricity to cool and fan the building).[22] Users can run the Explorer to output these values using the following instructions.[23]
  1. Download the tool and database from the ZIP archive online at http://bit.ly/2Kwvtpu. To install, copy the two files to a local folder.
  2. Open the Savings Explorer file. Click the "Launch Simulation Selector" button.
  3. The following inputs should be the same for all projects: simulation region = California; building vintage = new,[24] property = site energy; metric = savings intensity.
  4. The first query of the Explorer should be done to output energy intensity values for roofs (I_R and J_R). The second query should be done for building sides (I_T and J_T).
     a. The following inputs should be specified based on project-specific information.
        i. Building type (class/category) = (B).
        ii. Building climate zone (location) = (C).
        iii. Building orientation = (D).
        iv. Building side(s) to be cooled = (E). The first query should be roofs only, if applicable. The second should be the applicable building sides.
        v. Albedo of cool surface(s) = (F).
     b. Once all inputs are specified from #3 and #4, the Explorer will update the variables and results in columns A and B of the workbook.
     c. Sum the results from Column B for cooling, electric heating, and fan. This represents the change in electricity use for cool roofs (J_R). Take the gas heating results from Column B, which represents the change in natural gas use for cool roofs (I_R).
  5. Repeat #4 for the building sides to output (J_T and I_T).
- (K_z) – Table E-4.1 presents the four canyon aspect ratios used by Levinson (2019) to determine standard solar availability factors (SAF) for each wall direction. The canyon aspect ratio is the ratio of the project wall height to nearest building separation. The

[22] As the effects of climate change become more severe, temperatures and solar radiation during the winter may continually increase. The heating penalty may therefore be lower in future years, making this measure more effective at reducing GHG emissions.

[23] See additional instruction in Appendix P, Section 4 of Levinson et al. (2019).

[24] *New* as termed in the Explorer refers to buildings compliant with the 2016 Title 24 Standards. The latest Title 24 Standards are from 2019 and are updated every 3 years. Users should exercise caution in interpreting their results for future years subject to more stringent Title 24 Standards.

user should select the canyon aspect ratio that best corresponds to each project's cool wall to appropriately lookup the SAFs (Lz) in Table E-4.2.

- (L_z) – Table E-4.2 presents the average U.S. SAFs by cardinal direction and canyon aspect ratio. The SAFs are presented for two scenarios, one in which the neighboring building has cool walls and one in which it has conventional walls. The solar availability of the walls at the project building can be lowered by shadows cast by neighboring buildings and raised by sunlight reflected from neighboring buildings. The SAFs are used in the GHG reduction formula to adjust the values for energy use change from Levinson et al. (2019), which were based on model simulations with isolated buildings that were not surrounded by any buildings.
- (M) – The carbon intensity of residential natural gas was calculated in terms of CO_2e by multiplying the U.S. natural gas combustion emission factors for CO_2, CH_4, and N_2O (U.S. EPA 2020) by the corresponding 100-year GWP values from the IPCC's Fourth Assessment Report (IPCC 2007). See Table E-4.5 in Appendix C for more natural gas emission factors.
- (N) – GHG intensity factors for major California electricity providers are provided in Tables E-4.3 and E-4.4 in Appendix C. If the project study area is not serviced by a listed electricity provider, or the user is able to provide a project-specific value (i.e., for the future year not referenced in Appendix C), the user should use that specific value in the GHG calculation formula. If the electricity provider is not known, users may elect to use the statewide grid average carbon intensity.

GHG Calculation Caps or Maximums

It is assumed that the electricity demand of the user's project is currently being met by grid energy that requires *some* amount of fossil fuel-based energy generation, which emits GHGs from fuel combustion. In other words, the local electricity provider has an energy intensity factor (lb of CO_2e per MWh) greater than zero. For projects that are served by electricity providers already with a renewable portfolio of 100 percent, this measure could have no reduction on GHG emissions. If the electricity provider is using REC to meet a 100 percent renewable portfolio goal, then some emissions reductions may be achieved. In situations where the electricity from the electricity provider is already carbon free, this measure would increase GHG emissions by requiring additional natural gas consumption for building heating. This measure would still result in the co-benefit of reduced electricity use, enhanced energy security, and reduced urban heat island effect.

Mutually Exclusive Measures

If the user selects Measure E-15, *Require All-Electric Development*, they should exercise caution in quantifying the effect of this measure, given that it was developed assuming the residence would be supplied with natural gas (e.g., space heating).

Example GHG Reduction Quantification

The user reduces building energy emissions by providing a cool roof and walls in place of dark roofs and walls. In this example, the measure would be implemented in BCZ 7 (C) for a single-family home (B) with a fully covered (i.e., 100%) 1 KSF cool roof (G_R), and all building sides of 1 KSF covered in cool materials (H_z or H_N, H_S, H_E, H_W, and H_R). The project is located on a residential street with conventional surrounding buildings and has a canyon aspect ratio of 0.2 for all walls (K_z). Using this information, the SAFs (L_z) can be looked up in Table E-4.2. The electricity and natural gas use changes for the roof (I_R and J_R) and walls (I_T and J_T) can be looked up using the Explorer. The project is in San Diego Gas and Electric's service territory and would begin operation by 2022. It would, therefore, have an electricity carbon intensity of 542 lb CO_2e per MWh (N). In this example, emissions would be reduced by 0.3 MT CO_2e per year.

$$H_T = \mathbf{1\ KSF} + \mathbf{1\ KSF} + \mathbf{1\ KSF} + \mathbf{1\ KSF} = 4\ KSF$$

$$L_T = \left(1.02 \times \frac{\mathbf{1\ KSF}}{4\ KSF}\right) + \left(0.95 \times \frac{\mathbf{1\ KSF}}{4\ KSF}\right) + \left(0.96 \times \frac{\mathbf{1\ KSF}}{4\ KSF}\right) + \left(0.95 \times \frac{\mathbf{1\ KSF}}{4\ KSF}\right) = 0.9$$

$$A = \left[\left(\left(\frac{-0.003\ therm}{yr \cdot m^2} \times \mathbf{100\%} \times \mathbf{1\ KSF}\right) + \left(\frac{-0.005\ therm}{yr \cdot m^2} \times 0.97 \times 4\ KSF\right)\right) \times \frac{117\ lb\ CO_2e}{MMBtu} \times \frac{0.1\ MMBtu}{therm} \times \frac{0.000454\ MT}{lb} \times \frac{92.9\ m^2}{KSF}\right]$$

$$-\left[\left(\left(\frac{2.383\ kWh}{yr \cdot m^2} \times \mathbf{100\%} \times \mathbf{1\ KSF}\right) + \left(\frac{2.242\ kWh}{yr \cdot m^2} \times 0.97 \times \mathbf{4\ KSF}\right)\right) \times \frac{542\ lb\ CO_2e}{MWh} \times \frac{0.001\ MWh}{kWh} \times \frac{0.000454\ MT}{lb} \times \frac{92.9\ m^2}{KSF}\right] = \frac{-0.3\ MT\ CO_2e}{yr}$$

Quantified Co-Benefits

While the measure will achieve electricity savings, it can increase fuel consumption and potentially worsen ambient air quality. This measure also has direct climate resiliency benefits. Refer to Measure EH-3, *Install Heat-Reducing Roof*, in Chapter 4, *Assessing Climate Exposures and Measures to Reduce Vulnerabilities*.

Worsened Air Quality

While not quantified in this Handbook, lowered ambient air temperatures as a result of the reduced urban heat island effects (which can be significant if adoption is widespread) can decrease ozone formation, improving air quality.

If natural gas is used for heating, the increase in natural gas fuel consumption from this measure could result in local worsening of air quality. If electric heating is used at the project site, then there would not be an increase in criteria pollutants or worsened air quality. The increase in criteria pollutant emissions (U) resulting from the measure can be calculated as follows.

Energy Savings (Increased Fuel)

The increase in building natural gas consumption (S) and decrease in electricity use (T) achieved by the measure can be calculated as follows.

Natural Gas Increase Formula

$$S = ((I_R \times G_R \times H_R) + (I_T \times L_T \times H_T)) \times R$$

Electricity Reduction Formula

$$T = ((J_R \times G_R \times H_R) + (J_T \times L_T \times H_T)) \times R$$

Criteria Pollutant Emission Increase Formula

$$U = O \times V \times S \times W$$

Criteria Pollutant Emission Increase Calculation Variables

ID	Variable	Value	Unit	Source
Output				
U	Increase in criteria pollutant emissions from building energy	[ ]	ton per year	calculated
User Inputs				
	None			
Constants, Assumptions, and Available Defaults				
V	Criteria pollutant emission factors of natural gas	Table E-4.5	lb per MMBtu	U.S. EPA 1998
W	Conversion from lb to ton	0.0005	tons per lb	conversion

Further explanation of key variables:

- (V) – Table E-4.5 presents the criteria pollutant emission factors of natural gas for residential and commercial uses (U.S. EPA 1998).
- Please refer to the *GHG Calculation Variables* table above for definitions of variables that have been previously defined.

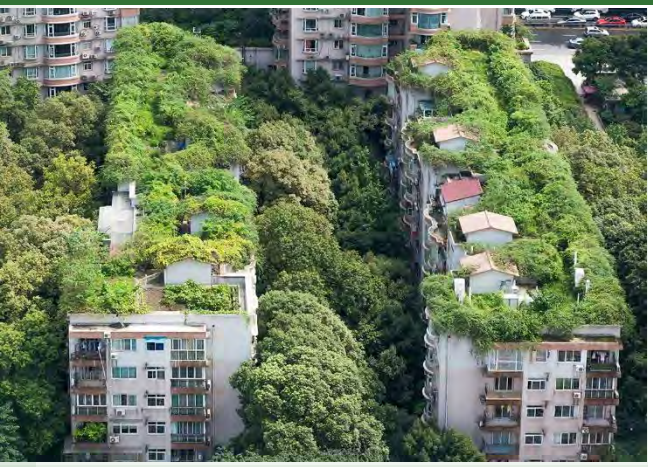
E-5. Install Green Roofs in Place of Dark Roofs



GHG Mitigation Potential

Potentially small reduction in GHG emissions from building energy use

Co-Benefits (icon key on pg. 34)

Climate Resilience

Installing green roofs increases resilience by absorbing less heat and keeping buildings cool, increasing the building's adaptive capacity to extreme heat. This also reduces the strain on the overall grid, particularly the risk of power outages during peak loads, and can reduce energy costs. Green roofs have a smaller heat island reduction effect than certified cool roofs but nonetheless are an improvement over conventional roofs.

Health and Equity Considerations

Green roofs provide additional insulation that can keep buildings cooler in the summer and warmer in the winter, reducing energy costs year-round. This can help protect health and increase economic resilience for vulnerable and low-income residents.

Measure Description

This measure will install green roofs in place of dark roofs. Green roofs consist of a layer of vegetation on top of buildings, which provides natural insulation and climate control benefits. This reduces the electricity and natural gas needed to provide cooling and heating, thereby reducing associated GHG emissions.

Subsector

Energy Efficiency Improvements

Scale of Application

Project/Site

Implementation Requirements

See measure description.

Cost Considerations

Green roofs are usually more expensive to install than conventional dark roofs; however, these costs can be quickly offset by reduced energy usage through better insulation, improved stormwater management, and, in some cases, an extended lifespan. Green roof maintenance costs include irrigation, weed control, and fertilizer in order to maintain the vegetation; however, green roofs generally cost substantially less than conventional roofs or cool roofs over a 50-year lifecycle.

Expanded Mitigation Options

Use native plants on the roof for improved ecosystem health, drought-tolerant plants for water conservation, or plant an edible garden for enhanced food security.

GHG Reduction Formula

$$A = D \times [(-E \times G \times I \times J) + (-F \times H \times K \times J)]$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Reduction in GHG emissions from building energy	[ ]	MT CO_2e per year	calculated
User Inputs				
B	Building type	[ ]	text	user input
C	Project location (city)	[ ]	text	user input
D	Roof area	[ ]	KSF	user input
Constants, Assumptions, and Available Defaults				
E	Natural gas savings with measure	Table E-5.1	therm per year per KSF	Sailor et al. 2008
F	Electricity savings with measure	Table E-5.1	kWh per year per KSF	Sailor et al. 2008
G	Carbon intensity of natural gas	Table E-4.5	lb CO_2e per MMBtu	U.S. EPA 2020
H	Carbon intensity of local electricity provider	Tables E-4.3 and E-4.4	lb CO_2e per MWh	CA Utilities 2021
I	Conversion from therm to MMBtu	0.1	MMBtu per therm	conversion
J	Conversion from lb to MT	0.000454	MT per lb	conversion
K	Conversion from kWh to MWh	0.001	MWh per kWh	conversion

Further explanation of key variables:

- (B) – The housing and building types are needed to look up the energy savings for residential and office development (E and F). If the user's building type of interest is not presented in Table E-5.1 in Appendix C, they should exercise caution in extrapolating the results from the listed building types.
- (C) – The project location (i.e., city) is used to look up the energy savings for residential and commercial development (E and F). If the user's city of interest is not presented in Table E-5.1, they should use their judgment to select a listed city that has similar climate and precipitation.
- (E and F) – The Green Roof Energy Calculator is a free, web-based tool developed in 2008 by academic researchers on behalf of the U.S. Green Building Council. The purpose of the tool is to enable architects, developers, and others to obtain quick estimates of how green roof design decisions might affect building energy use. To provide the user with a range of energy savings, the tool was run for the two available building types and five California cities using conservative values for the remainder of the tool inputs. These results are summarized in Table E-5.1. If the user can provide

project-specific values for tool inputs (i.e., growing media depth, leaf area index, irrigation, percent of total roof coverage, roof material albedo), then they should run the tool themselves and use the outputted energy savings in place of the values in Table E-5.1 (Sailor et al. 2008). Additionally, the user can consider calculating their energy savings from this measure using U.S. DOE's EnergyPlus, a more complex, robust model that requires more energy expertise and project inputs (U.S. DOE 2020).

- (G) – The carbon intensity of natural gas was calculated in terms of CO_2e by multiplying the U.S. natural gas combustion emission factors for CO_2, CH_4, and N_2O (U.S. EPA 2020) by the corresponding 100-year GWP values from the IPCC's Fourth Assessment Report (IPCC 2007). Table E-4.5 in Appendix C provides natural gas CO_2e emission factors for residential and commercial uses.
- (H) – GHG intensity factors for major California electricity providers are provided in Tables E-4.3 and E-4.4 in Appendix C. If the project study area is not serviced by a listed electricity provider, or the user is able to provide a project-specific value (i.e., for the future year not referenced in Tables E-4.3 and E-4.4), the user should use that specific value in the GHG calculation formula. If the electricity provider is not known, the user may elect to use the statewide grid average carbon intensity.

GHG Calculation Caps or Maximums

It is assumed that the energy demand of the user's project is currently being met by grid electricity that requires *some* amount of fossil fuel–based energy generation and/or onsite natural gas, both of which emit GHGs from fuel combustion. In other words, the local electricity provider has an energy intensity factor (lb of CO_2e per MWh) greater than zero and/or the project consumes natural gas onsite for building energy. For all-electric projects that are served by electricity providers already with a renewable portfolio of 100 percent, this measure could have no reduction in GHG emissions. If the electricity provider is using REC to meet a 100 percent renewable portfolio goal, then some emissions reductions may be achieved. This measure would still result in the co-benefits of reduced electricity use, enhanced energy security, and reduced urban heat island effect.

Mutually Exclusive Measures

If the user selects Measure E-15, *Require All-Electric Development*, they should exercise caution in quantifying the effect of this measure, given that some of the constants and available defaults were developed with the assumption that the building would be supplied with natural gas.

One option for including the quantified emissions reduction from this measure alongside those achieved by Measure E-15 would be to exclude all of the natural gas–related effects from this measure. In other words, (E) should be zeroed out in the above equation. Note that doing this may result in an underestimation of emissions reductions; green roofs provide additional insulation that can keep buildings warmer in the winter, as evidenced by Table E-5.1.

Example GHG Reduction Quantification

The user reduces building energy emissions by providing a green roof in place of a dark roof. In this example, the measure would be implemented in the city of Sacramento (C) for a mid-rise apartment complex (B) that has a roof area of 5 KSF. Therefore, the natural gas savings would be 8.2 therms per year per KSF (E), and the additional electricity savings would be 37.6 kilowatt-hours per year per KSF (F). The project is in Sacramento Municipal Utility District's (SMUD's) service territory and would begin operation by 2022. It would therefore have an electricity carbon intensity of 344 lb CO_2e per MWh (H). The mitigated emissions would be reduced by 0.32 MT CO_2e per year.

$$A = \mathbf{5\ KSF} \times \left[\left(\frac{\text{-8.2 therm}}{\text{yr·KSF}} \times \frac{\text{117 lb } CO_2e}{\text{MMBtu}} \times \frac{\text{0.1 MMBtu}}{\text{therm}} \times \frac{\text{0.000454 MT}}{\text{lb}}\right) + \left(\frac{\text{-126.7 kWh}}{\text{yr·KSF}} \times \frac{\text{344 lb } CO_2e}{\text{MWh}} \times \frac{\text{0.001 MWh}}{\text{kWh}} \times \frac{\text{0.000454 MT}}{\text{lb}}\right)\right] = \text{-0.32} \frac{\text{MT } CO_2e}{\text{yr}}$$

Quantified Co-Benefits

This measure also has direct climate resiliency benefits. Refer to Measure EH-3, Install Heat-Reducing Roof, in Chapter 4, *Assessing Climate Exposures and Measures to Reduce Vulnerabilities*.

Energy and Fuel Savings

The user would decrease the building natural gas consumption (E X D X I) and, depending on the climate zone for the project area, either decrease or increase the electricity use (F X D X K).

Improved Air Quality

The reduction in natural gas fuel consumption from this measure would result in local improvements in air quality because the fuel consumption occurs on site of the project. The reduction in criteria pollutant emissions (L) achieved by the measure can be calculated as follows.

Criteria Pollutant Emission Reduction Formula

$$L = \mathbf{D} \times \text{-}E \times M \times I \times N$$

Criteria Pollutant Emission Reduction Calculation Variables

ID	Variable	Value	Unit	Source
Output				
L	Reduction in criteria pollutant emissions from building energy	[ ]	tons per year	calculated
User Inputs				
	None			
Constants, Assumptions, and Available Defaults				
M	Criteria pollutant emission factors of natural gas	Table E-4.5	lb per MMBtu	U.S. EPA 1998
N	Conversion from lb to ton	0.0005	tons per lb	conversion

Further explanation of key variables:

- (M) – Table E-4.5 presents the criteria pollutant emission factors of natural gas for residential and commercial uses (U.S. EPA 1998).
- Please refer to the *GHG Calculation Variables* table above for definitions of variables that have been previously defined.

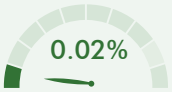
E-6. Encourage Residential Participation in Existing Demand Response Program(s)

GHG Mitigation Potential



Up to 0.02% reduction in GHG emissions from residential building electricity

Co-Benefits (icon key on pg. 34)

Climate Resilience

Strategic energy conservation during demand response events reduces the strain on the overall grid, particularly the risk of power outages during peak loads. It can also reduce energy costs, particularly if extreme heat would otherwise increase these costs.

Health and Equity Considerations

Demand response programs can help residents save money on utility costs and reduce exposure to extreme heat, supporting greater resilience to climate health impacts. This can be especially critical for low-income and vulnerable residents.

Measure Description

This measure will require marketing and promotion of the local utility's manual (i.e., behavioral) demand response program(s) to encourage participation from residents in the project area. Buildings contribute to GHG indirectly through electricity consumption. During demand response events, program users shift or conserve electricity, thereby reducing the associated indirect GHG emissions. Methods of engaging customers in demand response efforts include offering time-based rates, such as time-of-use pricing, critical peak pricing, variable peak pricing, real-time pricing, and critical peak rebates. Users are encouraged to respond to time-based rates or other forms of financial incentives with smart phone app, email, phone call, and/or text notifications.

Subsector

Energy Efficiency Improvements

Scale of Application

Project/Site or Plan/Community

Implementation Requirements

See measure description.

Cost Considerations

The cost of providing the demand response program is borne by the local utility. Property owners will realize cost savings from reduced electricity use.

Expanded Mitigation Options

The electricity reduction cited in the GHG emissions quantification methodology is based on a *manual* demand response program. Residential participation in an *automated* program, which requires smart appliances for the relevant end uses and appliances (e.g., heating and cooling, dishwashers, washing machines), can reduce user fatigue while improving the electricity reduction rates, yielding improved GHG emissions reductions.

GHG Reduction Formula

$$A = -\left(B \times C \times \frac{D}{E}\right)$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from residential electricity	0–0.2	%	calculated
User Inputs				
B	Level of participation	0–100	%	user input
Constants, Assumptions, and Available Defaults				
C	Electricity reduction during demand response event	18	%	CEC 2020
D	Average number of demand response events	100	hours per year	U.S. DOE 2010
E	Hours in a year	8,760	hours per year	conversion

Further explanation of key variables:

- (A) – The output provides the percent reduction in GHG emissions from residential building *electricity*. To determine the percent reduction in GHG emissions from total residential building *energy* (i.e., electricity plus natural gas), the user would need to know the percent of total GHG emissions from electricity. For example, if 40 percent of building energy emissions come from electricity, the percent reduction in GHG emissions from total building energy could be calculated as follows.

  $$A_{energy} = (40\% \times A_{electricity})$$

  Further, to determine the percent reduction in GHG emissions for a project with multiple residential buildings, the user would need to know the percent of total building energy emissions from each building. For example, if 67 percent of building energy emissions come from Building 1 and 33 percent come from Building 2, the percent reduction in GHG emissions from all building energy could be calculated as follows.

  $$A_{energy_total} = (67\% \times A_{energy_1}) + (33\% \times A_{energy_2})$$

- (B) – The level of participation refers to the percentage of households in the project area that enroll in the demand response program.
- (C) – OhmConnect is a demand response provider that challenges its users to reduce consumption during critical energy periods (i.e., events). OhmConnect measures the users' actual consumption against a calculated historical baseline and rewards them for the difference. A study of California OhmConnect users found that, on average, users reduced their energy consumption by 0.15 kWh, or 18 percent, during an

OhmConnect demand response event relative to what they would have consumed without an event (CEC 2020).

- (D) – It was estimated that demand response for managing peak loads involves, at most, 100 hours a year (U.S. DOE 2010). The user should input a project-specific value in the GHG reduction formula, if available.

GHG Calculation Caps or Maximums

It is assumed that the project's electricity demand is currently being met by grid electricity that requires *some* amount of fossil fuel–based energy generation, which emits GHGs from fuel combustion. In other words, the local electricity provider has an energy intensity factor (lb of CO_2e per MWh) greater than zero. For projects that are served by electricity providers already with a renewable portfolio of 100 percent, this measure could have no reduction in GHG emissions. If the electricity provider is using REC to meet a 100 percent renewable portfolio goal, then some emissions reductions may be achieved. This measure would still result in the co-benefits of reduced electricity use and enhanced energy security.

Example GHG Reduction Quantification

The user reduces the residential electricity consumption by providing incentives for expanded participation in an existing demand response program. In this example, the expected level of participation is 100 percent of households in the study area (B). The user would reduce GHG emissions from residential electricity by 0.2 percent.

$$A = -\left(100\% \times 18\% \times \frac{100\ \frac{hr}{yr}}{8{,}760\ \frac{hr}{yr}}\right) = -0.2\%$$

Quantified Co-Benefits

Energy and Fuel Savings

The percent reduction in residential building electricity achieved by the measure is the same as the percent reduction in GHG emissions (A).

E-7. Require Higher Efficacy Public Street and Area Lighting

GHG Mitigation Potential

Potentially moderate reduction in GHG emissions from street lighting

Co-Benefits (icon key on pg. 34)

Climate Resilience

Installation of more efficient lights can reduce the strain on the overall grid and reduce energy costs.

Health and Equity Considerations

Blue or full spectrum light may increase perceptions of safety but inhibit sleep patterns of nearby residents and reduce night sky visibility. Work with communities to determine appropriate color temperatures.

Measure Description

This measure will require the installation of higher efficacy public street and area lighting in place of typical or existing lamps. Lighting sources contribute to GHG indirectly through the production of the electricity that powers the lights. Installing more efficacious lamps, such as light-emitting diodes (LEDs), will use less electricity while producing the same amount of light, thereby reducing the associated indirect GHG emissions. In a 2012 survey of 212 California cities, 852,000 of the 1,100,000 streetlights (76 percent) were identified as high-pressure sodium lamps, while only 2 percent were LEDs (CLTC 2012).

Subsector

Energy Efficiency Improvements

Scale of Application

Plan/Community

Implementation Requirements

Users may take credit only if they are retrofitting existing street and area lights. This includes streetlights, pedestrian pathway lights, area lighting for parks and parking lots, and outdoor lighting around public buildings.

Cost Considerations

More energy-efficient lighting options are typically more expensive than less efficient ones, leading to greater installation costs. However, the replacement of less efficient lighting with more efficient bulbs reduces energy consumption and thereby reduces energy costs. Additionally, the rated life of more efficient bulbs is typically longer than less efficient ones, which reduces the frequency of replacement costs.

Expanded Mitigation Options

Incorporation of solar fixtures onto the street and area traffic lights would further reduce grid-supplied electricity consumption and associated emissions.

GHG Reduction Formula

$$A = \frac{B_1 \times C_1 - B_2 \times C_2}{B_1 \times C_1}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from outdoor street and area lighting	[ ]	%	calculated
User Inputs				
B_1	Number of existing lighting heads to be replaced	[ ]	lighting heads	user input
B_2	Number of proposed new lighting heads	[ ]	lighting heads	user input
C_1	Average power rating of existing lamp type	[ ]	watts	user input
C_2	Average power rating of proposed lamp type	[ ]	watts	user input
Constants, Assumptions, and Available Defaults				
	None			

Further explanation of key variables:

- (B_1 and B_2) – The number of existing and proposed lighting heads are required in the GHG reduction formula in case the new type of lamp results in less heads needing to be installed.
- (C_1 and C_2) – Lumens are the measure of the amount of light perceived by the human eye. Luminous efficacy is the amount of visible light emitted for a given amount of power. This measure assumes that the replacement lighting would provide the same number of lumens per area as the existing lighting and that only the power rating would change. See Table E-7.1 in Appendix C for a range of typical power ratings and efficacies of various outdoor lamp types (CLTC 2015). These values are for reference only for providing the user a list of existing and replacement lighting options. The user should input project-specific values in the GHG reduction formula, if available.

GHG Calculation Caps or Maximums

It is assumed that the electricity demand of the project's lighting is currently being met by grid electricity that requires *some* amount of fossil fuel–based energy generation, which emits GHGs from fuel combustion. In other words, the local electricity provider has an energy intensity factor (lb of CO_2e per MWh) greater than zero. For projects that are served by electricity providers already with a renewable portfolio of 100 percent, this measure could have no reduction in GHG emissions. If the electricity provider is using REC to meet a 100 percent renewable portfolio goal, then some emissions reductions may be achieved. This measure would still result in the co-benefits of reduced electricity use and enhanced energy security.

Example GHG Reduction Quantification

The user reduces the energy consumption of outdoor lighting by installing higher efficacy lighting. If the number of existing and proposed lighting heads are both 100 (B_1 and B_2), the power rating of the existing high-pressure sodium lamps is 120 watts, and the power rating of the proposed LED lamps is 80 watts, the user would reduce GHG emissions from outdoor lighting by 33.3 percent.

$$A = \frac{100 \text{ heads} \times 120 \text{ watts} - 100 \text{ heads} \times 80 \text{ watts}}{100 \text{ heads} \times 120 \text{ watts}} = -33.3\%$$

Quantified Co-Benefits

Energy and Fuel Savings

The percent reduction in electricity achieved by the measure is the same as the percent reduction in GHG emissions (A).

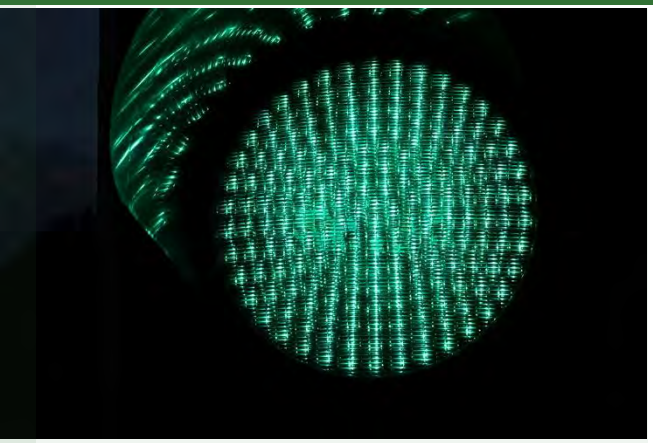
E-8. Replace Incandescent Traffic Lights with LED Traffic Lights



GHG Mitigation Potential

Potentially large reduction in GHG emissions from traffic light electricity use

Co-Benefits (icon key on pg. 34)

Climate Resilience

Installation of more efficient lights can reduce the strain on the overall grid and reduce energy costs.

Health and Equity Considerations

LED signal lights last longer than their incandescent counterparts, potentially improving traffic safety as they burn out less frequently.

Measure Description

This measure will replace incandescent traffic lights with more energy-efficient LED traffic lights. Installing LEDs reduces electricity demand and thus results in a reduction in indirect GHG emissions.

Subsector

Energy Efficiency Improvements

Scale of Application

Plan/Community. Not applicable at the Project/Site-scale, unless the development project requires modification of existing roadway infrastructure, including traffic lights.

Implementation Requirements

New traffic lights are required to be LED and meet minimum federal efficiency standards. User may take credit only if they are retrofitting existing incandescent traffic lights. Also, this measure may not be suitable in areas that receive substantial snowfall, which may cover and block light, unless the traffic lights are outfitted with winter-ready designs that prevent snow accumulation

Cost Considerations

LED lights are much more energy-efficient than incandescent lights, and greatly reduce energy consumption and increase cost savings. LED lights are typically more expensive than less efficient incandescent and incur greater costs from the initial purchase. However, the rated life of LEDs is typically longer than that of less efficient bulbs, which reduces the frequency of replacement costs.

Expanded Mitigation Options

Incorporation of solar fixtures onto the traffic lights would further reduce grid-supplied electricity consumption and associated emissions.

GHG Reduction Formula

$A = B \times C$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from traffic light electricity use	0–85	%	calculated
User Inputs				
B	Percentage of incandescent traffic lights in project study area to be retrofitted	0–100	%	user input
Constants, Assumptions, and Available Defaults				
C	Percent reduction in power consumption from LED lights compared to incandescent lights	85	%	U.S. DOE 2004

Further explanation of key variables:

- (B) – This methodology assumes that all the existing traffic lights only use incandescent bulbs. If the existing traffic lights are a mix of incandescent and LED bulbs, the LEDs should be excluded from the total number of lights that is used to determine the percentage for this variable.
- (C) – The percent reduction of 85 percent in power consumption is based on an average incandescent bulb power of 109 watts and an average LED bulb power of 17 watts (U.S. DOE 2004). The user should replace this default with a project-specific percent reduction in power consumption if the user knows the average wattage of the existing incandescent bulbs and/or the proposed LED bulbs.

GHG Calculation Caps or Maximums

It is assumed that the electricity demand of the project's traffic lights is currently being met by grid electricity that requires *some* amount of fossil fuel–based energy generation, which emits GHGs from fuel combustion. In other words, the local electricity provider has an energy intensity factor (lb of CO_2e per MWh) greater than zero. For projects that are served by electricity providers already with a renewable portfolio of 100 percent, this measure could have no reduction in GHG emissions. If the electricity provider is using REC to meet a 100 percent renewable portfolio goal, then some emissions reductions may be achieved. This measure would still result in the co-benefits of reduced electricity use and enhanced energy security.

Example GHG Reduction Quantification

If the user's project includes incandescent traffic lights, the user can reduce traffic light electricity by replacing the lights with LEDs. If all (i.e., 100 percent) of the incandescent lights are replaced with LED lights (B), the user would reduce GHG emissions from electricity used to power the incandescent traffic lights by 85 percent. The example measure emission reduction is calculated below.

$$A = 100\% \times 85\% = 85\%$$

Quantified Co-Benefits

Energy and Fuel Savings

(C) represents the percent energy savings for this measure. The project's electricity use from traffic lights in the study area would be reduced by up to 85 percent.

E-9. Utilize a Combined Heat and Power System

GHG Mitigation Potential

Potentially small reduction in GHG emissions from CHP energy generation

Co-Benefits (icon key on pg. 34)

Climate Resilience

CHP systems reduce sensitivity to fuel price shocks or scarcity and can contribute to generation capacity, reducing energy costs and the risk of outages. These systems can also provide backup energy to a building if the main grid fails during an extreme weather event.

Health and Equity Considerations

Reduction of natural gas combustion would help improve indoor air quality. However, CHP systems still involve natural gas usage, and thus localized effects of emissions on communities should be reviewed closely.

Measure Description

This measure involves using combined heat and power (CHP) systems in place of separate heat and power (SHP) systems. For the same level of power output, CHP systems use less input energy than traditional SHP generation, resulting in lower CO_2 emissions. In traditional SHP systems, heat created as a by-product is wasted as it is released into the surrounding environment. CHP systems harvest the thermal energy and use it to heat onsite uses or for processes in proximity, which reduces the amount of natural gas or other fuel that would otherwise be combusted for heating or for use in those processes. CHP systems also result in a reduced demand for electricity from the grid, which displaces the CO_2 emissions from the production of electricity from the grid.

Subsector

Energy Efficiency Improvements

Scale of Application

Project/Site

Implementation Requirements

It is possible that certain CHP systems may not be appropriate for certain locations, where the carbon intensity of the electricity provider is relatively low. In these instances, the emissions reduction will be negative, which indicates an emissions increase.

Cost Considerations

CHP systems are more efficient than systems where heat and power are produced separately. As long as the system is located near to where the power and heat are being used, CHP systems are quick and relatively inexpensive to install. Coupled with the energy savings associated with the improved efficiency, CHP systems represent a long-term potential cost savings.

Expanded Mitigation Options

Non-applicable.

GHG Reduction Formula

This section describes how to estimate emissions reductions from utilizing a CHP system to supply energy demands that would otherwise have been provided by separate heat and power systems (e.g., electricity from the grid for uses requiring electricity and boilers for thermal demand). The user should quantify emissions reductions using the U.S. EPA's (2020) CHP Energy and Emission Calculator (CHP Tool), which allows users to estimate the energy savings from displaced electricity and thermal production from 10 CHP technologies: reciprocating engine (rich burn, lean burn, and diesel) microturbine, fuel cell, combustion turbine, boiler/steam turbine, other prime mover, and waste-heat-to-power (power only, and power and thermal).

The user has the option to input project-specific data, such as fuels types, duct burner operation, cooling demand, and boiler efficiencies. The CHP Tool has the capabilities to calculate GHG emissions reduction directly from the use of CHP systems, and the user can choose to use the calculator for that purpose. To ensure consistency with the methods and factors used for other measures in this document, the user can also use the calculator to determine the energy savings and calculate the GHG reductions separately, using the methodology provided in this section.

$$A1 = [(B \times C \times D) + (E \times F) - (G \times F)] \times H$$

$$A2 = \frac{(D + G) - B}{(D + G)}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A1	Reduction in GHG emissions from use of CHP System	[ ]	MT CO_2e	calculated by user or in CHP Tool
A2	Percent reduction in GHG emissions from use of CHP System	[ ]	%	calculated by user or in CHP Tool
User Inputs				
	None			
Constants, Assumptions, and Available Defaults				
G	Fuel consumption of CHP system	[ ]	MMBtu per year	calculated in CHP Tool
F	Carbon intensity of commercial natural gas	119	lb CO_2e per MMBtu	U.S. EPA 2020
B	Displaced electricity production from CHP use	[ ]	MMBtu per year	calculated in CHP Tool
C	Conversion from MMBtu to kWh	0.2931	MWh per MMBtu	conversion

ID	Variable	Value	Unit	Source
D	Carbon intensity of local electricity provider	Tables E-4.3 and E-4.4	lb CO_2e per MWh	CA Utilities 2021
E	Displaced thermal production from CHP use	[ ]	MMBtu per year	calculated in CHP Tool
H	Conversion from lb to MT	0.000454	MT per lb	conversion

Further explanation of key variables:

- (A1) – The methodology shown for (A1) involves the use of the fuel consumption results provided by the CHP Tool (Table 1 of the Results tab in the CHP Tool). However, the user can also use the CHP Tool to calculate GHG reductions directly (Table 2 of the Results tab in the CHP Tool). The CHP Tool allows the user to choose an electricity emissions factor (the "displaced electricity generation profile") from a pre-determined list, or it allows the user to enter a custom emission factor. If calculating GHG emissions directly in the CHP Tool, the user should enter a custom emission factor that corresponds to the applicable electricity provider for only CO_2 emissions. The CHP Tool does not allow the user to enter a CO_2e factor.
- (B, D, G) – Standard assumptions to calculate these energy quantities are from EPA's CHP Tool, which can be inputted by the user, are included below. The user should enter project-specific values if available.
  - Operation of 8,760 hours per year.
  - Provides heat only (no cooling).
  - Combusts natural gas fuel (1,028 Btu/ft^3 heat content).
  - No supplementary duct burner.
  - Assumes 4.8 percent transmission loss for displaced electricity (based on Western Interconnect assumptions from the CHP Tool).
  - Assumes thermal demand for a boiler with 80 percent efficiency.

GHG Calculation Caps or Maximums

- All caps and maximums are indicated in the EPA's CHP Tool.
- Because the electric power sector is progressively becoming a zero-carbon source, this measure may not achieve GHG reductions for some combinations of CHP system types, sizes, and other variables inputted into the CHP Tool. In those cases, the CHP Tool will return negative energy savings or emissions reductions, meaning that using a CHP system would result in an increase in energy consumption and emissions relative to using SHP generation. If considering a CHP system to reduce GHG emissions and save energy, the user should ensure that the CHP set-up actually results in reductions.

Example GHG Reduction Quantification

The user's project includes a single unit 600 kW microturbine CHP system fueled by natural gas and used for heating-only with no duct burners. The CHP system is assumed to operate for 8,760 hours per year and is displacing a new gas boiler. Parameters for both the microturbine CHP system and the displaced new gas boiler are assumed from the CHP

Tool. The electricity that is displaced by the CHP system is derived entirely from a natural gas-based powerplant. The electricity provider for the project area is Imperial Irrigation District and the analysis year is 2025. The carbon intensity of electricity is, therefore, 225 lb CO_2e per megawatt-hour (D). The energy quantities calculated from the CHP Tool are displaced electricity production (40,252 MMBtu), displaced thermal production (25,258 MMBtu), and a CHP system consumption of (59,831MMBtu). The example scenario results in a 662 MT CO_2e reduction.

$$A1 = [\left(40{,}252\ \text{MMBtu} \times 0.2931 \frac{\text{MWh}}{\text{MMBtu}} \times 225 \frac{\text{lb } CO_2e}{\text{MWh}}\right) + \left(25{,}258\ \text{MMBtu} \times 119 \frac{\text{lb } CO_2e}{\text{MMBtu}}\right) - (59{,}831\ \text{MMBtu} \times 119 \frac{\text{lb } CO_2e}{\text{MMBtu}})] \times 0.000454 \frac{\text{MT}}{\text{lb}} = \text{-662 MT } CO_2e$$

$$A2 = \frac{(40{,}252\ \text{MMBtu} + 25{,}258\ \text{MMBtu}) - 59{,}831\ \text{MMBtu}}{(40{,}252\ \text{MMBtu} + 25{,}258\ \text{MMBtu})} = 9\%$$

Quantified Co-Benefits

Improved Air Quality

The CHP Tool can calculate reductions in two criteria air pollutants (NO_x and SO_2). To quantify this co-benefit, the user should use the CHP Tool.

Energy and Fuel Savings

To calculate the energy savings for this measure (H), the user should add the displaced electricity production (D) and displaced thermal production (G) from the CHP Tool and then subtract the CHP system energy consumption (B) from the CHP Tool.

Energy Savings Formula

$$H = (D + G) - B$$

E-10-A. Establish Onsite Renewable Energy Systems–Generic

GHG Mitigation Potential

Varies

Variable reduction in GHG emissions from building energy use depending on renewable electricity generation compared to building energy consumption

Co-Benefits (icon key on pg. 34)

Climate Resilience

Installing onsite renewable energy systems provides backup generation sources that can contribute to generation capacity and reduce the risk of outages, particularly if an extreme event disrupts the grid. Onsite renewable energy can also reduce energy costs.

Health and Equity Considerations

Onsite renewable energy can provide protection against grid disruptions, which can be critical to protect the health of vulnerable people, such as seniors and those who use electric medical equipment.

Measure Description

This measure requires electricity to be generated from an onsite renewable or zero-emission power system. This displaces the electricity demand that would ordinarily be supplied by the local electricity provider. Electricity generation provided by local electricity providers have varying carbon intensities based on the portfolio of energy sources. Some renewable energy systems, such as fuel cells, may not be completely GHG emissions-free, but may still have lower emissions than the electricity provided by the local electricity provider (unless the electricity provider has a relatively high renewable portfolio), thereby reducing GHG emissions. Zero-emissions power systems, such as PV panels, result in the greatest magnitude of emissions reductions. Onsite renewable systems can also provide back-up power as an alternative to diesel generators in the event of grid power outages or demand response events.

Subsector

Renewable Energy Generation

Scale of Application

Project/Site

Implementation Requirements

Renewable energy systems powered by solar and/or wind should be quantified under Measures E-10-B or E-10-C, respectively.

Cost Considerations

Installation costs for onsite renewable energy generation vary greatly depending on the type of energy system and the size of the installation, but overall, installation costs can be high. These costs are recouped by large cost savings as the property owner can use electricity produced on site instead of purchased from the grid, or even a net profit if excess energy is sold to an electricity provider. Additionally, initial installation costs can be partially offset by credits and rebates meant to encourage renewable energy generation.

Expanded Mitigation Options

Pair with Measure E-23, *Use Microgrids and Energy Storage*, in Table 3-2 to store and then deploy surplus electricity generated from the renewable energy system. This would improve the capacity of the system to displace more grid-supplied electricity, further reducing associated emissions.

GHG Reduction Formula

$$A = \frac{-B}{C} \times \frac{E - D}{E}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from electricity use	0–100	%	calculated
User Inputs				
B	Electricity provided by onsite power system with measure	[ ]	kWh per year	user input
C	Total electricity demand	[ ]	kWh per year	user input
D	Carbon intensity of onsite power system	[ ]	lb CO_2e per MWh	user input
Constants, Assumptions, and Available Defaults				
E	Carbon intensity of local electricity provider	Tables E-4.3 and E-4.4	lb CO_2e per MWh	CA Utilities 2021

Further explanation of key variables:

- (D) – If the onsite power system is a zero-emission source, then the GHG emission reduction (A) is effectively equivalent to the ratio of electricity from the zero-emission system (B) to the total electricity demand (C). If the onsite power system is not a zero-emission source, then the GHG emission reduction calculation needs to consider the GHG intensity factor of the onsite power system (D) and the local electricity provider (E).
- (E) – GHG intensity factors for major California electricity providers are provided in Tables E-4.3 and E-4.4 in Appendix C. If the project study area is not serviced by a listed electricity provider, or the user is able to provide a project-specific value (i.e., for the future year not referenced in Tables E-4.3 and E-4.4), the user should use that specific value in the GHG calculation formula. If the electricity provider is not known, users may elect to use the statewide grid average carbon intensity.

GHG Calculation Caps or Maximums

It is assumed that the electricity demand of the project is currently being met by grid energy that requires *some* amount of fossil fuel–based energy generation, which emits GHGs from fuel combustion. In other words, the local electricity provider has an energy intensity factor (lb of CO_2e per kWh) greater than zero. For projects that are served by electricity providers with a renewable portfolio standard of 100 percent, this measure would effectively have no reduction in GHG emissions, although it would still result in the co-benefit of enhanced energy security.

Example GHG Reduction Quantification

If the user's project consumes electricity from a local electricity provider with a non-zero carbon intensity, the user can reduce the project's emissions from electricity consumption by displacing the electricity demand met by the local electricity provider with an onsite power system. In this example, the onsite power system would provide 2,000 kWh per year (B) at a carbon intensity of 50 lb CO_2e per megawatt-hour (D). The proposed project would have a total electricity demand of 10,000 kWh per year (C). It would be constructed in Southern California Edison's service territory and would begin operation by 2022. Without this measure, the project would, therefore, have an electricity carbon intensity of 351 lb CO_2e per MWh (E). The user would reduce GHG emissions from electricity use by 17 percent.

$$A = \frac{\frac{\text{-2,000 kWh}}{\text{yr}}}{\frac{\text{10,000 kWh}}{\text{yr}}} \times \frac{\frac{351 \text{ lb } CO_2e}{\text{MWh}} - \frac{\text{50 lb } CO_2e}{\text{MWh}}}{\frac{351 \text{ lb } CO_2e}{\text{MWh}}} = \text{-17\%}$$

Quantified Co-Benefits

Successful implementation of this measure would reduce grid electricity, and a portion of this electricity is supplied by statewide fossil-fueled power plants, which generates criteria pollutants. However, because these power plants are located throughout the state, the reduction in electricity use from this measure will not reduce localized criteria pollutant emissions and are, therefore, not discussed.

E-10-B. Establish Onsite Renewable Energy Systems–Solar Power

GHG Mitigation Potential

Varies

Variable reduction in GHG emissions from building energy use depending on renewable electricity generation compared to building energy consumption

Co-Benefits (icon key on pg. 34)

Climate Resilience

Installing onsite renewable energy systems provides backup generation sources that can contribute to generation capacity and reduce the risk of outages, particularly if an extreme event disrupts the grid. Onsite renewable energy can also reduce energy costs.

Health and Equity Considerations

Solar panels may conflict with tree canopies, which reduces temperatures and improves public health; projects should be carefully designed to minimize these conflicts.

Measure Description

This measure requires electricity to be generated from onsite PV systems, displacing the electricity demand that would ordinarily be supplied by the local electricity provider. Electricity generation provided by local electricity providers have varying carbon intensities based on the portfolio of energy sources. Because PV systems generate zero GHG emissions, this measure displaces the emissions that would have been produced had electricity been supplied by the local electricity provider, and thus results in a reduction in GHG emissions. Onsite renewable systems can also provide back-up power as an alternative to diesel generators in the event of grid power outages.

Subsector

Renewable Energy Generation

Scale of Application

Project/Site

Implementation Requirements

See measure description.

Cost Considerations

Installation costs for solar power vary on the type and size of the generator; however, initial costs are still considered high. These costs are recouped by large cost savings as the property owner can use electricity produced on site, or even a net profit if excess energy is sold to an electricity provider. Additionally, initial installation costs can be at least partially offset by credits and rebates meant to encourage renewable energy use. Solar power may require the purchase of additional property large enough to host the generators.

Expanded Mitigation Options

Pair with Measure E-23, *Use Microgrids and Energy Storage*, in Table 3-2 to store and then deploy surplus electricity generated from the renewable energy system. This would improve the capacity of the system to displace more grid-supplied electricity, further reducing associated emissions.

GHG Reduction Formula

$$A = \frac{-B}{C}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from electricity use	0–100	%	calculated
User Inputs				
B	Electricity provided by PV system with measure	[ ]	kWh per year	user input
C	Total electricity demand	[ ]	kWh per year	user input
Constants, Assumptions, and Available Defaults				
	None			

Further explanation of key variables:

- (B) – The amount of electricity generated by a PV system depends on the size and type of the PV system and the location of the project. The user can use a publicly available solar calculator, such as the NREL PVWatts® Calculator, to estimate the size of the PV system needed to generate the desired amount of electricity. The only input required for this calculator is the location (i.e., zip code). Estimates of the amount of electricity that can be generated from 3, 5, and 10 kilowatt PV systems in cities around California are shown in Table E-10-B.1 in Appendix C (NREL 2017). Other calculators include Google's Project Sunroof (Google n.d.) and solar-estimate.org (2021).

GHG Calculation Caps or Maximums

It is assumed that the electricity demand of the user's project is currently being met by grid energy that requires *some* amount of fossil fuel–based energy generation, which emits GHGs from fuel combustion. In other words, the local electricity provider has an energy intensity factor (lb of CO_2e per kWh) greater than zero. For projects that are served by electricity providers with a renewable portfolio standard of 100 percent, this measure would effectively have no reduction in GHG emissions, although it would still result in the co-benefit of enhanced energy security.

Example GHG Reduction Quantification

If the user's project consumes electricity from a local electricity provider with a non-zero carbon intensity, the user can reduce the project's emissions from electricity consumption by displacing the electricity demand met by the local electricity provider with an onsite solar photovoltaic system. If the total electricity demand is 10,000 kWh per year (C), and the solar power system provides 5,000 kWh per year (B), the user would reduce GHG

emissions from electricity use by 50 percent. The example measure emission reduction is calculated below.

$$A = \frac{\frac{-5{,}000\ \text{kWh}}{\text{yr}}}{\frac{10{,}000\ \text{kWh}}{\text{yr}}} = -50\%$$

Quantified Co-Benefits

Successful implementation of this measure would reduce grid electricity, and a portion of this electricity is supplied by statewide fossil-fueled power plants, which generates criteria pollutants. However, because these power plants are located throughout the state, the reduction in electricity use from this measure will not reduce localized criteria pollutant emissions and are, therefore, not discussed.

E-10-C. Establish Onsite Renewable Energy Systems–Wind Power

GHG Mitigation Potential

Varies

Variable reduction in GHG emissions from building energy, depending on renewable electricity generation compared to building energy consumption

Co-Benefits (icon key on pg. 34)

Climate Resilience

Installing onsite renewable energy systems provides backup generation sources that can contribute to generation capacity and reduce the risk of outages, particularly if an extreme event disrupts the grid. Onsite renewable energy can also reduce energy costs.

Health and Equity Considerations

Consider noise impacts in places with nearby sensitive receptors.

Measure Description

This measure requires electricity to be generated from onsite wind power systems, displacing the electricity demand that would ordinarily be supplied by the local electricity provider. Electricity generation provided by local electricity providers have varying carbon intensities based on the portfolio of energy sources. Since wind turbines generate zero GHG emissions, this measure displaces the emissions that would have been produced had electricity been supplied by the local electricity provider and thus results in a reduction in GHG emissions. Onsite renewable systems can also provide back-up power as an alternative to diesel generators in the event of grid power outages.

Subsector

Renewable Energy Generation

Scale of Application

Project/Site

Implementation Requirements

See measure description.

Cost Considerations

Installation costs for wind power generation vary based on the type and size of the turbine, however, initial costs are still considered high. These costs are recouped by large cost savings as the property owner can use electricity produced on site instead of purchased from the grid, or even at a net profit if excess energy is sold to an electricity provider. Additionally, initial installation costs can be at least partially offset by credits and rebates meant to encourage renewable energy generation.

Expanded Mitigation Options

Pair with Measure E-23, *Use Microgrids and Energy Storage*, in Table 3-2 to store and then deploy surplus electricity generated from the renewable energy system. This would improve the capacity of the system to displace more grid-supplied electricity, further reducing associated emissions.

GHG Reduction Formula

$$A = \frac{-B}{C}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from electricity use	0–100	%	calculated
User Inputs				
B	Electricity provided by wind power system with measure	[ ]	kWh per year	user input
C	Total electricity demand	[ ]	kWh per year	user input
Constants, Assumptions, and Available Defaults				
	None			

Further explanation of key variables:

- (B) – The amount of electricity that can be supplied by wind power is highly dependent on location. To implement this measure, users should consider their project's location and other factors that may determine onsite wind power feasibility, such as cost, neighboring land uses, and local ordinances. The U.S. DOE has resources available for wind energy in California, such as wind speed maps (U.S. DOE n.d.). Additionally, the NREL's Wind Prospector is an interactive mapping tool, where users can determine if their project's location is likely to have suitable wind capacity factors (NREL n.d.).

GHG Calculation Caps or Maximums

It is assumed that the electricity demand of the user's project is currently being met by grid energy that requires *some* amount of fossil fuel–based energy generation, which emits GHGs from fuel combustion. In other words, the local electricity provider has an energy intensity factor (lb of CO_2e per kWh) greater than zero. For projects that are served by electricity providers with a renewable portfolio standard of 100 percent, this measure would effectively have no reduction in GHG emissions, although it would still result in the co-benefit of enhanced energy security.

Example GHG Reduction Quantification

If the user's project consumes electricity from a local electricity provider with a non-zero carbon intensity, the user can reduce the project's emissions from electricity consumption by displacing the electricity demand met by the local electricity provider with an onsite wind power system. If the total electricity demand is 10,000 kWh per year (C), and the wind power system provides 1,000 kWh per year (B), the user would reduce GHG emissions from electricity use by 10 percent. The example measure emission reduction is calculated below.

$$A = \frac{\frac{-1{,}000\ \text{kWh}}{\text{yr}}}{\frac{10{,}000\ \text{kWh}}{\text{yr}}} = -10\%$$

Quantified Co-Benefits

Successful implementation of this measure would reduce grid electricity, and a portion of this electricity is supplied by statewide fossil-fueled power plants, which generates criteria pollutants. However, because these power plants are located throughout the state, the reduction in electricity use from this measure will not reduce localized criteria pollutant emissions and are, therefore, not discussed.

E-11. Procure Electricity from Lower Carbon Intensity Power Supply

GHG Mitigation Potential

Up to 100% of GHG emissions from electricity use

Co-Benefits (icon key on pg. 34)

Climate Resilience

Procuring electricity from lower carbon intensity power supplies can reduce sensitivity to fuel price shocks or scarcity.

Health and Equity Considerations

Reducing demand for electricity from fossil-fuel sources will help to improve air quality at electrical plants currently using fossil fuels.

Measure Description

This measure will commit the project to procuring electricity with a lower carbon intensity than the primary product offered by the local provider (often an investor-owned utility). This would displace the electricity demand that would ordinarily be supplied by the local electricity provider's energy mix. Electricity provided by local electricity providers have varying carbon intensities based on the portfolio of energy sources. Procurement of electricity of a lower carbon intensity would displace the emissions that would have been produced had the electricity been supplied by the default energy mix and thus results in a reduction in GHG emissions. Green power supply options include utility green power products, community choice aggregation, shared renewables (e.g., community solar), and power purchase agreements.

Subsector

Renewable Energy Generation

Scale of Application

Project/Site and Plan/Community

Implementation Requirements

Purchase electricity from a green power supplier, including utility green power products, community choice aggregation, shared renewables (e.g., community solar), and power purchase agreements.

Cost Considerations

The least carbon-intensive fuels are renewable fuels; however, even switching from high carbon-intensity fossil fuels, like coal and petroleum, to lower intensity fossil fuels, like natural gas, represents a cost savings. The costs associated with building renewable energy generating capacity up to a utility scale are high and require constructing large-scale renewable energy plants and power storage facilities. However, the cost of building new carbon intensive power generation plants is similar, if not higher. Renewable energy plants can usually be completed more quickly than a fossil-fueled energy plant, saving construction costs. Renewable energy facilities may also have a significant operational cost savings, as many, like solar and wind, do not require fuel inputs.

Expanded Mitigation Options

Procure electricity from a zero-carbon power supply to eliminate all emissions from building electricity.

GHG Reduction Formula

$$A = \frac{B}{C} - 1$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from electricity	0–100	%	calculated
User Inputs				
B	Average carbon intensity of power supply with green power	[ ]	lb CO_2e per MWh	user input
Constants, Assumptions, and Available Defaults				
C	Carbon intensity of local electricity provider without measure	Tables E-4.3 and E-4.4	lb CO_2e per MWh	CA Utilities 2021

Further explanation of key variables:

- (B) – The carbon intensity of the green power supply may be available online directly from the power provider and/or indirectly from the relevant state agencies (e.g., CEC, CARB). If publicly unavailable, the user should request this information from the power provider for the year(s) of interest.
- (C) – GHG intensity factors for major California electricity providers are provided in Tables E-4.3 and E-4.4 in Appendix C. If the project study area is not serviced by a listed electricity provider, or the user is able to provide a project-specific value (i.e., for the future year not referenced in Tables E-4.3 and E-4.4), the user should use that specific value in the GHG calculation formula. If the electricity provider is not known, users may elect to use the statewide grid average carbon intensity.

GHG Calculation Caps or Maximums

It is assumed that the electricity demand of the user's project is currently being met by grid energy that requires some amount of fossil fuel-based energy generation, which emits GHGs from fuel combustion. In other words, the local electricity provider has an energy intensity factor (lb of CO_2e per kilowatt-hour) greater than zero. For projects that are served by electricity providers already with a renewable portfolio standard of 100 percent, this measure would effectively have no reduction on GHG emissions.

Example GHG Reduction Quantification

The user displaces indirect emissions from electricity by committing the project to procuring power with a lower carbon intensity than the primary local provider. In this example, the green power supply has a carbon intensity of zero (B) because 100 percent of the electricity is from zero-emission energy sources. The project is in the SMUD service territory and

would be operational in 2030. The electricity provider's carbon intensity factor is 224 lb CO_2e per MWh (C). The user would reduce GHG emissions from electricity by 100 percent.

$$A = \frac{0 \frac{\text{lb } CO_2e}{\text{MWh}}}{224 \frac{\text{lb } CO_2e}{\text{MWh}}} - 1 = -100\%$$

Quantified Co-Benefits

Successful implementation of this measure would reduce grid electricity, and a portion of this electricity is supplied by statewide fossil-fueled power plants, which generates criteria pollutants. However, because these power plants are located throughout the state, the reduction in electricity use from this measure will not reduce localized criteria pollutant emissions and are, therefore, not discussed.

E-12. Install Alternative Type of Water Heater in Place of Gas Storage Tank Heater in Residences

GHG Mitigation Potential

Potentially moderate reduction in GHG emissions from building natural gas

Co-Benefits (icon key on pg. 34)

Climate Resilience

Using alternative types of water heaters that use less fuel can reduce sensitivity to fuel price shocks or scarcity; however, they may decrease resilience if they are the only option available during a power outage. This measure may also power the appliance from the grid rather than from fuel, offering more reliability if the grid has been adapted to climate change or less reliability if the grid has not been adapted.

Health and Equity Considerations

Reduction of natural gas combustion in homes can help reduce indoor pollution.

Measure Description

This measure requires installation of a water heater that is less emissions intensive than a natural gas conventional storage tank water heater in residential developments. Alternatives analyzed in this measure are electric conventional storage tanks, solar water heaters with natural gas backup, and solar water heaters with electric backup. Each alternative reduces GHG emissions in a slightly different way. An electric storage tank heater displaces natural gas consumption with electricity use, replacing more emissions-intensive natural gas with less emissions-intensive electricity. A solar water heater with electric backup reduces GHG emissions by displacing natural gas with zero-emission solar energy when water is heated by the system's solar collectors and grid electricity when the back-up function is utilized. A solar water heater with natural gas backup reduces emissions by displacing natural gas with solar energy when water is heated by the solar collectors.

Subsector

Building Decarbonization

Scale of Application

Project/Site and Plan/Community

Implementation Requirements

Alternative water heaters analyzed in this measure include electric conventional storage tanks, solar water heaters with natural gas backup, and solar water heaters with electric backup.

Cost Considerations

Non-conventional heaters can have high initial and construction costs (e.g., upgrading the electric panel). However, alternatives to natural gas storage tank heaters are more energy efficient and cost less to operate once they are installed. Common alternatives also require less fuel, maintenance, and upkeep than natural gas heaters, leading to additional long-term cost savings.

Expanded Mitigation Options

Pair with Measure E-3-A, *Require Energy Efficiency Residential Boilers,* to reduce energy use from both space heating and water heating, yielding increased GHG reductions. Also, a heat pump is another option for an alternative water heater that is highly efficient, though the associated energy reductions were not quantified as part of this measure (see Measure E-25, *Install Electric Heat Pumps*, in Table 3-2).

GHG Reduction Formula

$A1 = (-E \times C \times G \times I \times J) + (F_1 \times C \times H \times K \times J)$

$A2 = (F_2 - E) \times C \times G \times I \times J$

GHG Calculation Variables

Based on 2019 survey data, approximately 73 percent of California residences use conventional storage tank heaters fueled by natural gas for primary water heating (CEC 2020). Therefore, for the purposes of this measure, natural gas storage tanks are the type of water heater that the user would be displacing.

ID	Variable	Value	Unit	Source
Output				
A1	Reduction in GHG emissions from building energy for electric storage tank heater or solar water heater with electric backup	[ ]	MT CO_2e per year	calculated

J	Conversion from lb to metric ton (MT)	0.000454	MT per lb	conversion
K	Conversion from kWh to MWh	0.001	MWh per kWh	conversion

Further explanation of key variables:

- (B) – The housing types are needed to look up the energy use by type of heater (F_1 and F_2) in Table E-12.1.
- (D) – The CEC has specified 28 distinct EDFZs in California. Users should refer to Figure E-1.1 in Appendix C to determine the EDFZ for their project. This measure relies on energy consumption data from the year 2019 tied to the CEC's (2020) 2019 RASS. Because data from all 28 EDFZs are not included in the RASS, representative data from similar EDFZs may need to be used. Users should refer to Table E-1.1 for the proxy EDFZ that corresponds with those listed in Table E-12-1.
- (E, F_1, and F_2) – The CEC administered the statewide RASS in 2019. The study yielded energy consumption estimates for 27 electric and 10 natural gas residential end uses, including hot water heaters. Based on this data for the year 2019, the average natural gas and electricity consumption by heater type for each EDFZ and housing type is provided in Table E-12.1 in Appendix C. If the data is unavailable for a specific EDFZ, users may elect to use the statewide averages. If the user is able to provide a project-specific value, then the user should replace the defaults in the GHG calculation formula. CEC's 2019 Building Energy Standards provide detailed equations for this calculation (CEC 2019).
- (G) – The carbon intensity of residential natural gas was calculated in terms of CO_2e by multiplying the U.S. natural gas combustion emission factors for CO_2, CH_4, and N_2O (U.S. EPA 2020) by the corresponding 100-year GWP values from the IPCC's Fourth Assessment Report (IPCC 2007). See Table E-4.5 in Appendix C for more natural gas emission factors.
- (H) – GHG intensity factors for major California electricity providers are provided in Tables E-4.3 and E-4.4. If the project study area is not serviced by a listed electricity provider, or the user is able to provide a project-specific value (i.e., for a future year not referenced in Tables E-4.3 and E-4.4), the user should use that specific value in the GHG calculation formula. If the electricity provider is not known, users may elect to use the statewide grid average carbon intensity.

GHG Calculation Caps or Maximums

Mutually Exclusive Measures

If the user selects Measure E-15, *Require All-Electric Development*, they may not also take credit for this measure (Measure E-12) or Measure E-13, *Install Electric Ranges in Place of Gas Ranges,* which electrify select appliances. Measure E-15 accounts for the combined GHG reductions achieved by each of these measures, as well as the electrification of other end uses. To combine the GHG reductions from Measure E-15 with Measure E-12 or Measure E-13 would be considered double counting.

Example GHG Reduction Quantification

The user reduces building energy emissions by installing in a proposed residential development an alternative type of water heater in place of a natural gas storage tank heater. In this example, 10 single-family homes (B and C) would be constructed in EDFZ 7 (D) with a solar water heater with electric backup. Therefore, the fuel consumption for each

home's storage tank heater would be 260 therms per year (E), and the electricity consumption for a solar water heater with electric backup would be 483 kilowatt-hours per year (F1), based on Table E-12.1. The homes are in Los Angeles Department of Water and Power's service territory and would be constructed by 2022. It would, therefore, have an electricity carbon intensity of 694 lb CO_2e per MWh (H). The mitigated emissions would be reduced by 12.3 MT CO_2e per year.

$$A1 = \left(\frac{\text{-260 therm}}{\text{yr·du}} \times \textbf{10 du} \times \frac{\text{117 lb } CO_2e}{\text{MMBtu}} \times \frac{\text{0.1 MMBtu}}{\text{therm}} \times \frac{\text{0.000454 MT}}{\text{lb}}\right) + \left(\frac{\text{483 kWh}}{\text{yr·du}} \times \textbf{10 du} \times \frac{\text{694 lb } CO_2e}{\text{MWh}} \times \frac{\text{0.001 MWh}}{\text{kWh}} \times \frac{\text{0.000454 MT}}{\text{lb}}\right) = \text{-12.3} \frac{\text{MT } CO_2e}{\text{yr}}$$

Quantified Co-Benefits

Energy and Fuel Savings

Energy use conversion from major natural gas appliances to their equivalent electric replacements tends not to be straightforward given that most significant gas appliances (e.g., water heaters, space heaters, ovens and cooktops) have varying input-to-output efficiencies and losses from product to product. Equivalent electric appliances also have differing efficiencies, and usage patterns for these equivalent appliances may differ in some way. If installing an electric storage tank heater or solar water heater with electric backup (A_1), the user would decrease the building natural gas consumption (E) and increase the electricity use (F_1). If installing a solar water heater with natural gas backup (B_2), the user would decrease the building natural gas consumption (F_2-E).

Improved Air Quality

The reduction in natural gas fuel consumption from this measure would result in local improvements in air quality because the fuel consumption occurs on site of the project. The reduction in criteria pollutant emissions (L_1 and L_2) achieved by the measure can be calculated as follows.

Criteria Pollutant Emission Reduction Formula

Use (L_1) if installing an electric storage tank heater or solar water heater with electric backup. Use (L_2) if installing a solar water heater with natural gas backup.

$$L1 = \text{-E} \times \textbf{C} \times M \times I \times N$$

$$L2 = (F_2 - E) \times \textbf{C} \times M \times I \times N$$

Criteria Pollutant Emission Reduction Calculation Variables

ID	Variable	Value	Unit	Source
Output				
L1	Reduction in criteria pollutant emissions from building energy for electric storage tank heater or solar water heater with electric backup	[ ]	tons per year	calculated
L2	Reduction in criteria pollutant emissions from building energy for solar water heater with natural gas backup	[ ]	tons per year	calculated
User Inputs				
	None			
Constants, Assumptions, and Available Defaults				
M	Criteria pollutant emission factors of natural gas	Table E-4.5	lb per MMBtu	U.S. EPA 1998
N	Conversion from lb to ton	0.0005	tons per lb	conversion

Further explanation of key variables:

- (M) – Table E-4.5 presents the criteria pollutant emission factors of natural gas for residential and commercial uses (U.S. EPA 1998). For projects in Bay Area Air Quality Management District or South Coast Air Quality Management territory, see the footnote in Table E-4.5 about a regionally specific NO_x emission factor.

E-13. Install Electric Ranges in Place of Gas Ranges

GHG Mitigation Potential

Potentially small reduction in GHG emissions from building natural gas

Co-Benefits (icon key on pg. 34)

Climate Resilience

Installing electric ranges that use electricity rather than fuel can reduce sensitivity to fuel price shocks or scarcity. Electric ranges also offer more reliability if the grid has been adapted to climate change or less reliability if the grid has not been adapted.

Health and Equity Considerations

Natural gas ranges are a primary sources of residential indoor air pollution (e.g., NOx, CO, and formaldehyde), with the impacts being greater in smaller living spaces and kitchens with inefficient or no vent hoods—disproportionately affecting low-income residents and renters. Replacing natural gas ranges with electric ones thus vastly improves indoor air quality.

Measure Description

This measure requires that residential or commercial developments install an electric range (i.e., cooktop plus oven) in place of a gas range. An electric range displaces natural gas consumption with electricity use, replacing a more emissions-intensive fossil fuel-based source of energy with electricity from the grid that is increasingly transitioning to renewable sources.

Subsector

Building Decarbonization

Scale of Application

Project/Site

Implementation Requirements

The electric range must have an electric or induction cooktop and an electric oven. Because induction cooktops are superior in performance to traditional electric cooktops and comparable to gas, the use of induction cooktops is strongly recommended to help overcome any user hesitancy or preference for gas.

Cost Considerations

Electric cooktops are twice as energy efficient as gas ranges, representing a large cost savings from reduced energy consumption. Electric stoves have similar costs as natural gas stoves and are relatively inexpensive to install. Induction cooktops have higher upfront costs compared to gas ranges but similar cost savings (induction cooktops do not radiate heat, which translates into reduced home cooling costs during warm days). Buyer costs include the purchase of magnetic-based pots and pans (e.g., stainless steel or cast iron) specialized for use on induction cooktops.

Expanded Mitigation Options

Limit gas barbecue grills, which would provide additional GHG mitigation and improved localized air quality.

GHG Reduction Formula

$$A = (-E \times C \times G \times I \times J) + (F \times C \times H \times K \times J)$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Reduction in GHG emissions from building energy	[ ]	MT CO_2e per year	calculated
User Inputs				
B	Housing or building type	[ ]	text	user input
C	Number of du or size of commercial building	[ ]	du or 1,000 gross square feet (KSF)	user input
Constants, Assumptions, and Available Defaults				
D	Electricity Demand Forecast Zone	Figure E-1.1 Table E-1.1	integer	CEC 2017
E	Fuel consumption for natural gas range	Table E-15.1 or Table E-15.2	therm per year per du or therm per year per KSF	CEC 2020, 2021
F	Electricity use for electric cooktop	Table E-15.1 or Table E-15.2	kWh per year per du or kWh per year per KSF	CEC 2020, 2021
G	Carbon intensity of natural gas (commercial/residential)	119/117	lb CO_2e per MMBtu	U.S. EPA 2020
H	Carbon intensity of local electricity provider	Tables E-4.3 and E-4.4	lb CO_2e per MWh	CA Utilities 2021
I	Conversion from therm to MMBtu	0.1	MMBtu per therm	conversion
J	Conversion from lb to MT	0.000454	MT per lb	conversion
K	Conversion from kWh to MWh	0.001	MWh per kWh	conversion

Further explanation of key variables:

- (B) – The housing and building types are needed to look up the energy use by type of cooking appliance (E).
- (D) – The CEC has specified 28 distinct EDFZs in California. Users should refer to Figure E-1.1 in Appendix C to determine the EDFZ for their project. This measure relies on energy consumption data from the year 2019 tied to the CEC's Commercial Forecast and the 2019 RASS (2020, 2021). Because data from all 28 EDFZs are not included in the Commercial Forecast or RASS, representative data from similar EDFZs may need to be used. Users should refer to Table E-1.1 for the proxy EDFZ that corresponds with those listed in Tables E-15.1 and E-15.2.

- (E and F) – The CEC administered the statewide RASS in 2019. The study yielded energy consumption estimates for 27 electric and 10 natural gas residential end uses, including cooking appliances. Based on this data for the year 2019, the average natural gas and electricity consumption by cooking appliance type for each EDFZ and housing type is provided in Table E-15.1 in Appendix C. If the data is missing for the EDFZ, users may elect to use the statewide averages. If the user is able to provide a project-specific value, then the user should replace the defaults in the GHG calculation formula. CEC's 2019 Building Energy Standards provide detailed equations for this calculation (CEC 2019).

  The CEC prepared the Commercial Forecast in October 2019. The Commercial Forecast is generated by a computer model developed by the CEC to forecast electricity and natural gas consumption for commercial building types in California. The data that informs the model includes previous commercial end use surveys, floor space and vacancy estimates (based on econometric and demographic data), adopted building and appliances standards, weather data (cooling and heating degree days), and electricity and natural gas rates. The Commercial Forecast provides energy consumption estimates for 13 commercial end uses, including cooking. Based on this data for 2019, the average statewide natural gas and electricity consumption for cooking appliances for each building type is provided in Table E-15.2. If the user can provide a project-specific value, then the user should replace the defaults in the GHG calculation formula.
- (G) – The carbon intensity of residential and commercial natural gas was calculated in terms of CO_2e by multiplying the U.S. natural gas combustion emission factors for CO_2, CH_4, and N_2O (U.S. EPA 2020) by the corresponding 100-year GWP values from the IPCC's Fourth Assessment Report (IPCC 2007). See Table E-4.5 in Appendix C for more natural gas emission factors.
- (H) – GHG intensity factors for major California electricity providers are provided in Tables E-4.3 and E-4.4 in Appendix C. If the project study area is not serviced by a listed electricity provider, or the user is able to provide a project-specific value (i.e., for the future year not referenced in Appendix C), the user should replace the default in the GHG calculation formula. If the electricity provider is not known, users may elect to use the statewide grid average carbon intensity.

GHG Calculation Caps or Maximums

Mutually Exclusive Measures

If the user selects Measure E-15, *Require All-Electric Development*, they may not also take credit for Measure E-12, *Install Alternative Type of Water Heater in Place of Gas Storage Tank Heater in Residences,* or this measure (Measure E-13), which electrify select appliances. Measure E-15 accounts for the combined GHG reductions achieved by each of these measures, as well as the electrification of other end uses. To combine the GHG reductions from Measure E-15 with Measure E-12 or Measure E-13 would be considered double counting.

Example GHG Reduction Quantification

The user reduces building energy emissions by installing in the proposed residential development an electric range in place of a natural gas range. In this example, the measure would be implemented for 20 low-rise apartments (C) to be constructed in EDFZ 3 (D).

Therefore, the fuel consumption for a natural gas range would be 21 therms per year per du (E), and the electricity consumption for an electric cooktop per du would be 115 kilowatt-hours per year (F_1). The project is in Pacific Gas & Electric's service territory and would begin operation by 2022. It would, therefore, have an electricity carbon intensity of 206 lb CO_2e per MWh (G). The mitigated emissions would be reduced by 2.0 MT CO_2e per year.

$$A = \left(\frac{-21 \text{ therm}}{\text{yr·du}} \times \mathbf{20\ du} \times \frac{117 \text{ lb } CO_2e}{\text{MMBtu}} \times \frac{0.1 \text{ MMBtu}}{\text{therm}} \times \frac{0.000454 \text{ MT}}{\text{lb}}\right) + \left(\frac{115 \text{ kWh}}{\text{yr·du}} \times \mathbf{20\ du} \times \frac{206 \text{ lb } CO_2e}{\text{MWh}} \times \frac{0.001 \text{ MWh}}{\text{kWh}} \times \frac{0.000454 \text{ MT}}{\text{lb}}\right) = -2.0 \frac{\text{MT } CO_2e}{\text{yr}}$$

Quantified Co-Benefits

While the measure will achieve fuel savings, it will also increase electricity consumption. For more information on the public health effects of gas cooking appliances, refer to the resources available from the Rocky Mountain Institute (Rocky Mountain Institute 2020).

Fuel Savings (Increased Electricity)

Energy use conversion from major natural gas appliances to their equivalent electric replacements tends not to be straightforward given that most significant gas appliances (e.g., water heaters, space heaters, ovens, and cooktops) have varying input-to-output efficiencies and losses from product to product. Equivalent electric appliances also have differing efficiencies, and usage patterns for these equivalent appliances may differ in some way. If installing an electric cooktop, the user would decrease the building natural gas consumption (E) and increase the electricity use (F).

Improved Air Quality

The reduction in natural gas fuel consumption from this measure would result in local improvements in air quality because the fuel consumption occurs on site of the project. The reduction in criteria pollutant emissions (L) achieved by the measure can be calculated as follows.

Criteria Pollutant Emission Reduction Formula

$$L = -E \times C \times M \times I \times N$$

Criteria Pollutant Emission Reduction Calculation Variables

ID	Variable	Value	Unit	Source
Output				
L	Reduction in criteria pollutant emissions from building energy	[ ]	tons per year	calculated
User Inputs				
	None			

Constants, Assumptions, and Available Defaults				
M	Criteria pollutant emission factors of natural gas	Table E-4.5	lb per MMBtu	U.S. EPA 1998
N	Conversion from lb to ton	0.0005	tons per lb	conversion

Further explanation of key variables:

- (M) – Table E-4.5 presents the criteria pollutant emission factors of natural gas for residential and commercial uses (U.S. EPA 1998).
- Please refer to the *GHG Calculation Variables* table above for definitions of variables that have been previously defined.

E-14. Limit Wood Burning Devices and Natural Gas/Propane Fireplaces in Residential Development

GHG Mitigation Potential

Potentially large reduction in GHG emissions from wood burning devices

Co-Benefits (icon key on pg. 34)

Climate Resilience

Limiting wood burning and natural gas/propane fireplaces and replacing them with electric appliances can reduce sensitivity to fuel price shocks or scarcity; however, they may decrease resilience if they are the only option available during a power outage. This also offers more reliability if the grid has been adapted to climate change or less reliability if the grid has not been adapted.

Health and Equity Considerations

This may increase winter heating costs for some residents in colder climate zones. Eliminating wood burning and combustion of natural gas and propane in homes can help reduce indoor pollution and greatly reduce outdoor air pollution.

Measure Description

This measure requires committing to not installing any wood burning devices (i.e., woodstoves and fireplaces) or natural gas or propane fireplaces in proposed residential developments. This avoids the combustion of biomass, natural gas, and propane, thereby reducing associated biogenic and non-biogenic GHG emissions. The most efficient alternatives to wood burning devices or gas fireplaces are electric fireplace inserts and electric heat pumps.

Subsector

Building Decarbonization

Scale of Application

Project/Site and Plan/Community

Implementation Requirements

This measure may not be applicable in areas where wood burning devices in new development are already prohibited. In such areas, this measure could be applied for informational purposes, to determine the GHG and air quality benefits in new development achieved by restrictions on wood burning devices. However, users should exercise caution in taking credit for any emissions benefit from this measure in areas where the existing baseline already prohibits wood burning devices.

Cost Considerations

Wood, natural gas, and propane fireplaces use more energy and fuel to heat an area than centralized heating systems and have additional costs to purchase fuel for the fireplace. Electric imitation fireplaces meant for cosmetic purposes are less expensive to install and much more energy efficient. For heat production purposes, portable space heaters that run on electricity have the same benefits in cost reduction and allow the owner to use the same device in multiple locations, saving the cost of installing more units.

Expanded Mitigation Options

Consider electrifying all end uses (e.g., space heating, water heating) by implementing Measure E-15, *Require All-Electric Development*.

GHG Reduction Formula

$$A = -D \times \left[\left(\left((E_1 \times K_1 + E_2 \times K_2 + E_3 \times K_3 + E_4 \times K_4) \times G\right) + F_1 \times L_1 \times H\right) \times N\right) + \left((F_2 \times L_2 + F_3 \times L_3) \times I \times J \times M\right)\right] \times O$$

GHG Calculation Variables

O	Conversion from lb to MT	0.000454	MT per lb	conversion

Further explanation of key variables:

- (B and C) – The project location and housing type are needed to lookup the percent of du with various types of woodstoves and fireplaces (E_1 through E_4 and F_1 through F_3).
- (E_1 through J) – The percent of du with various types of woodstoves and fireplaces, amount of wood burned by woodstoves and fireplaces, and fireplace usage is based on data supplied by local air districts and state defaults (CA Air Districts 2021). Table E-14.1 in Appendix C presents this information by housing type for each county, air basin, and air district.
- (K_1 through L_3) – The carbon intensity of the various woodstoves and fireplace fuels were calculated in terms of CO_2e by multiplying the emission factors for CO_2, CH_4, and N_2O (U.S. EPA 1996a, 1996b, 2020) by the corresponding 100-year GWP values from the IPCC's Fourth Assessment Report (IPCC 2007). See Table E-14.2 in Appendix C for these emission factors.
- (K_1 through L_1) – GHG emissions from the combustion of wood or biomass are considered biogenic emissions, meaning they are derived from living cells, as opposed to fossil fuels that have been transformed by geological processes. Some protocols do not consider these emissions to be part of an emission inventory. In these instances, users should take care to keep them distinct from non-biogenic emissions caused by natural gas and propane fireplaces (L_2 and L_3).

- (M) – The heating rate of natural gas and propane is based on the upper range provided in the South Coast Air Quality Management District's environmental assessment for Rule 445, Wood Burning Devices (SCAQMD 2008).

GHG Calculation Caps or Maximums

None.

Example GHG Reduction Quantification

The user avoids emission from wood burning devices by eliminating woodstoves and fireplaces from the proposed residential development. In this example, the proposed project would be a 100-unit (D) multi-family housing development (C) located in the Great Basin Valley Air Basin (B). Based on this information, Table E-14.1 can be used to determine the percent of du with various types of woodstoves and fireplaces, the amount of wood burned by woodstoves and fireplaces, and the fireplace usage (E_1 through J). The mitigated emissions would be reduced by -151 MT CO_2e per year.

$$A = \text{-100 units} \times \left[\left(\left(\left(\left(0\% \times \frac{3{,}792 \text{ lb } CO_2e}{\text{ton wood}} + 5\% \times \frac{3{,}277 \text{ lb } CO_2e}{\text{ton wood}} + 5\% \times \frac{3{,}400 \text{ lb } CO_2e}{\text{ton wood}} + 0\% \times \frac{3{,}400 \text{ lb } CO_2e}{\text{ton wood}}\right) \times \frac{3{,}019.2 \text{ lb wood}}{\text{yr}}\right) + 35\% \times \frac{3{,}480 \text{ lb } CO_2e}{\text{ton wood}} \times \frac{3{,}078.4 \text{ lb wood}}{\text{yr}}\right) \times \frac{0.005 \text{ ton}}{\text{lb}}\right) + \left(\left(55\% \times \frac{117 \text{ lb } CO_2e}{\text{MMBtu}} + 0\% \times \frac{141.3 \text{ lb } CO_2e}{\text{MMBtu}}\right) \times \frac{3 \text{ hours}}{\text{day}} \times \frac{82.0 \text{ days}}{\text{yr}} \times \frac{0.06 \text{ MMBtu}}{\text{hour}}\right)\right] \times \frac{0.000454 \text{ MT}}{\text{lb}} = \frac{\text{-151 MT } CO_2e}{\text{yr}}$$

Quantified Co-Benefits

Improved Air Quality

The reduction in wood, natural gas, and propane combustion from this measure would result in local improvements in air quality because the combustion occurs on site of the project. The reduction in criteria pollutant emissions (Q) achieved by the measure would be calculated the same way as the GHG reduction equation, except for the following differences.

- (K_1 through L_3) – Use the criteria pollutant emission factors in Table E-14.2 in Appendix C instead of the GHG emission factors (U.S. EPA 1996a, 1996b, 2015; CARB 2011).
- (N) – Replace (O) with (N) because criteria pollutant emissions are reported as tons of pollutant per year, whereas GHG emissions are reported in units of metric tons.

Energy and Fuel Savings

The reduction in natural gas and propane fuel consumption (P) achieved by this measure, in units of MMBtu per year, can be calculated as follows.

Fuel Reduction Formula

$$P = -D \times (F_2 + F_3) \times I \times J \times M$$

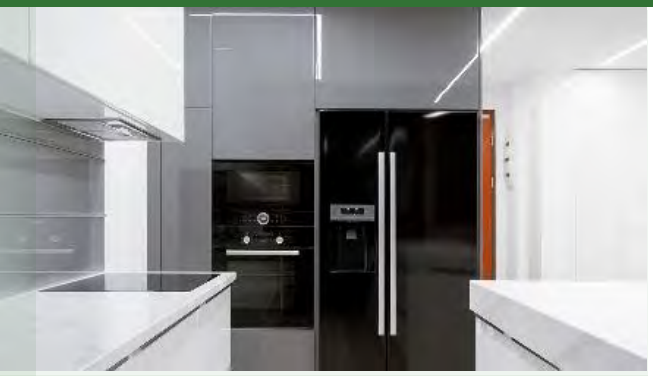
E-15. Require All-Electric Development



GHG Mitigation Potential

Potentially large reduction in GHG emissions from building energy use

Co-Benefits (icon key on pg. 34)

Climate Resilience

Requiring all-electric development can reduce sensitivity to fuel price shocks or scarcity and offer more reliability if electricity providers have been adapted to climate change. However, this may decrease resilience if the grid has not been adapted to climate change and if there are no non-electric backup options during a power outage.

Health and Equity Considerations

Elimination of natural gas combustion in homes will improve indoor air quality, as natural gas appliances produce pollutants such as NOx, formaldehyde, and CO. Plans, backups, and contingencies should be in place in the event of extended power failure (consider implementing with Measure E-23, *Use Microgrids and Energy Storage*, in Table 3-2).

Measure Description

This measure requires that residential or commercial developments use all-electric appliances and end uses. Using electric instead of natural gas-powered appliances and end uses replaces a more emissions-intensive fossil fuel source of energy with a less emissions-intensive source of energy, electricity from the grid that is increasingly transitioning to renewable sources.

Subsector

Building Decarbonization

Scale of Application

Project/Site and Plan/Community

Implementation Requirements

It is expected that user's building would electrify the most common natural gas end uses—space heating, water heating, and range (i.e., cooktop plus oven). Additional natural gas end uses include dryer, auxiliary heat, pool heat, spa heat, solar water heater with natural gas backup, and miscellaneous, as discussed below under *GHG Calculation Variables*.

Cost Considerations

Although electric appliances for residential and commercial properties sometimes cost more to purchase and install, they are more energy efficient than conventional natural gas appliances. This can lead to long-term cost savings through reduced energy consumption. Electric appliances also usually require less maintenance than conventional appliances.

Expanded Mitigation Options

One of the most efficient ways to provide space heating with electricity is to use heat pumps, which provides increased efficiency relative to traditional electric resistance heating (see Measure E-25, *Install Electric Heat Pumps*, in Table 3-2). The associated energy reduction from heat pumps was not quantified as part of this measure.

GHG Reduction Formula

$$A = (-E \times C \times G \times I \times J) + (F \times C \times H \times K \times J)$$

GHG Calculation Variables

K	Conversion from kWh to MWh	0.001	MWh per kWh	conversion

Further explanation of key variables:

- (B) – The housing and building types are needed to look up the energy use for electric and natural gas end uses for residential and commercial development (E and F).
- (D) – The CEC has specified 28 distinct EDFZs in California. Users should refer to Figure E-1.1 in Appendix C to determine the EDFZ for their project. This measure relies on energy consumption data from the year 2019 tied to the CEC's Commercial Forecast and the 2019 RASS (CEC 2020, 2021). Because data from all 28 EDFZs are not included in the Commercial Forecast and RASS, representative data from similar EDFZs may need to be used. Users should refer to Table E-1.1 for the proxy EDFZ that corresponds with those listed in Tables E-15.1 and E-15.2.

- (E and F) – The CEC administered the statewide RASS in 2019. The study yielded energy consumption estimates for 27 electric and 10 natural gas residential end uses. Based on this data for the year 2019, the average natural gas and electricity consumption by end use for each EDFZ and housing type is provided in Table E-15.1. The natural gas end uses included in the RASS and reflected in this measure include space heating, water heating, range/oven, dryer, auxiliary heat, pool heat, spa heat, solar water heater with natural gas backup,[25] and miscellaneous.[26] There are electric equivalent end uses for each of these end uses, with the addition of heat pumps as an option for space heating and the exception of pool heat, which requires a manual user input. Users should only evaluate the end uses applicable to their project. For example, most residences will not be built with spas, and only single-family housing has solar water heaters. A minimum recommendation is that the primary natural gas end uses that are commonly electrified be included—space heating, water heating, and range/oven. If the data is missing for the EDFZ or end use, users may elect to use the statewide averages. If users are able to provide a project-specific value, then they should replace the defaults in the GHG calculation formula.

  The CEC prepared the Commercial Forecast in October 2019. The Commercial Forecast is generated by a computer model developed by the CEC to forecast electricity and natural gas consumption for commercial building types in California. The data that informs the model includes previous commercial end use surveys, floor space and vacancy estimates (based on econometric and demographic data), adopted building and appliances standards, weather data (cooling and heating degree days), and electricity and natural gas rates. The Commercial Forecast provides energy consumption estimates for 13 electric and 6 natural gas commercial end uses. Based on this data for 2019, the average statewide natural gas and electricity consumption by end use for each building type is provided in Table E-15.2. The natural gas end uses included in the Commercial Forecast and reflected in this measure include space heating, cooling, water heating, range/oven, refrigeration, and miscellaneous.[27] Users should only evaluate the end uses applicable to their project. A minimum recommendation is that the primary natural gas end uses that are commonly electrified be included—space heating, water heating, and range/oven. If the data is missing for the EDFZ or end use, users may elect to use the statewide averages. If users are able to provide a project-specific value, then they should replace the defaults in the GHG calculation formula.
- (G) – The carbon intensity of natural gas was calculated in terms of CO_2e by multiplying the U.S. natural gas combustion emission factors for CO_2, CH_4, and N_2O (U.S. EPA 2020) by the corresponding 100-year GWP values from the IPCC's Fourth Assessment Report (IPCC 2007). See Table E-4.5 in Appendix C for more natural gas emission factors.
- (H) – GHG intensity factors for major California electricity providers are provided in Tables E-4.3 and E-4.4. If the project study area is not serviced by a listed electricity provider, or the user is able to provide a project-specific value (i.e., for the future year not referenced in Tables E-4.3 and E-4.4), the user should use that specific value in the

[25] Only allowed for single-family housing.

[26] The RASS "miscellaneous" end use category includes approximately 20 appliances, ranging from portable fans to wine coolers to aquariums. Users should exercise caution in applying the average energy consumption data for this category to their project.

[27] The commercial energy forecast "miscellaneous" end use category includes over 50 equipment types, ranging from specialized medical equipment for hospital buildings to ATM machines for retail buildings to shop tools for warehouses. Users should exercise caution in applying the average energy consumption data for this category to their project.

GHG calculation formula. If the electricity provider is not known, the user may elect to use the statewide grid average carbon intensity.

GHG Calculation Caps or Maximums

Mutually Exclusive Measures

If users select this measure (Measure E-15), they may not also take credit for Measure E-12, *Install Alternative Type of Water Heater in Place of Gas Storage Tank Heater in Residences*, or Measure E-13, *Install Electric Ranges in Place of Gas Ranges,* which electrify select appliances. This measure (Measure E-15) accounts for the combined GHG reductions achieved by each of these measures, as well as the electrification of other end uses. To combine the GHG reductions from this measure (Measure E-15) with Measure E-12 or Measure E-13 would be considered double counting.

Example GHG Reduction Quantification

The user reduces building energy emissions by electrifying the proposed development with electric end uses in place of natural gas end uses. In this example, the measure would be implemented at 20 apartments in a high-rise building (C) to be constructed in EDFZ 11 (D). Natural gas end uses without the measure include water heater, primary heat, range/oven, and dryer resulting in 261 therms per year per du (E). The electricity consumption to electrify these end uses would be 2,611 kilowatt-hours per year per du (F_1). The project is in City of Riverside's service territory and would begin operation by 2022. It would therefore have an electricity carbon intensity of 791 lb CO_2e per megawatt-hour (G). The mitigated emissions would be reduced by 9 MT CO_2e per year.

$$A = \left(\frac{\text{-261 therm}}{\text{yr·du}} \times \textbf{20 du} \times \frac{\text{117 lb } CO_2e}{\text{MMBtu}} \times \frac{\text{0.1 MMBtu}}{\text{therm}} \times \frac{\text{0.000454 MT}}{\text{lb}}\right) + \left(\frac{\text{2,611 kWh}}{\text{yr·du}} \times \textbf{20 du} \times \frac{\text{791 lb } CO_2e}{\text{MWh}} \times \frac{\text{0.001 MWh}}{\text{kWh}} \times \frac{\text{0.000454 MT}}{\text{lb}}\right) = \text{-9} \frac{\text{MT } CO_2e}{\text{yr}}$$

Quantified Co-Benefits

Energy and Fuel Savings

Energy use conversion from major natural gas appliances to their equivalent electric replacements tends not to be straightforward given that most significant gas appliances (e.g., water heaters, space heaters, ovens and cooktops) have varying input-to-output efficiencies and losses from product to product. Equivalent electric appliances also have differing efficiencies, and usage patterns for these equivalent

appliances may differ in some way. If electrifying a building, the user would decrease the building natural gas consumption (E) and increase the electricity use (F).

Improved Air Quality

The reduction in natural gas fuel consumption from this measure would result in local improvements in air quality because the fuel consumption occurs on site of the project. The reduction in criteria pollutant emissions (L) achieved by the measure can be calculated as follows.

Criteria Pollutant Emission Reduction Formula

$$L = -E \times C \times M \times I \times N$$

Criteria Pollutant Emission Reduction Calculation Variables

ID	Variable	Value	Unit	Source
Output				
L	Reduction in criteria pollutant emissions from building energy	[ ]	tons per year	calculated
User Inputs				
	None			
Constants, Assumptions, and Available Defaults				
M	Criteria pollutant emission factors of natural gas	Table E-4.5	lb per MMBtu	U.S. EPA 1998
N	Conversion from lb to ton	0.0005	tons per lb	conversion

Further explanation of key variables:

- (M) – Table E-4.5 presents the criteria pollutant emission factors of natural gas for residential and commercial uses (U.S. EPA 1998).
- Please refer to the *GHG Calculation Variables* table above for definitions of variables that have been previously defined.

E-16. Require Zero Net Energy Buildings

GHG Mitigation Potential

Potentially large reduction in GHG emissions from building energy use

Co-Benefits (icon key on pg. 34)

Climate Resilience

Requiring ZNE buildings can reduce sensitivity to fuel price shocks or scarcity and offer more reliability if electricity providers have been adapted to climate change or less reliability if the grid has not been adapted. If the development produces and exports emission-free energy, this increases energy resilience and adds generation capacity to the overall grid, reducing risk of outages.

Health and Equity Considerations

As a ZNE building is likely to exclude or limit natural gas combustion, it would likely improve indoor and regional air quality.

Measure Description

This measure requires the user to operate their building at ZNE. A ZNE building foremost reduces GHG emissions by reducing energy use through more efficient design. Further, the building avoids GHG emissions either by using no emissions-generating energy sources or offsetting the building energy emissions by exporting emission-free energy (typically from onsite renewables). For residential buildings, the user can determine achievement of ZNE performance by entering the project details into the CEC's CBECC-Res 2019 executable file (Wilcox 2020). CBECC-Res 2019 uses the energy design rating, represented by the Time Dependent Valuation (TDV), as a way to express the energy consumption of a building as a rating score index (CEC 2018).

Subsector

Building Decarbonization

Scale of Application

Project/Site and Plan/Community

Implementation Requirements

CEC defines a ZNE Code Building as one where the net energy produced by onsite renewables is equal to the building energy consumption, measured using the CEC's TDV metric. The California Department of General Services defines ZNE more broadly, including not only buildings but campuses, portfolios, and communities (BluePoint Planning 2018).

Cost Considerations

ZNE buildings would have highly variable costs, including building onsite renewable energy, more expensive building materials to improve energy efficiency, and carbon offsets and/or renewable energy credits (RECs). While purchasing RECs may be less costly than building onsite generation, the project would not gain the co-benefits of greater energy resilience and contribution to grid capacity. And while all these costs may be high, the cost savings from reduced energy usage are also substantial.

Expanded Mitigation Options

Instead implement Measure E-17, *Require Renewable Surplus Buildings*, which results in a surplus of renewable energy and therefore increased GHG reductions and co-benefits.

GHG Reduction Formula

A = -100%

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from building energy	100	%	calculated
User Inputs				
	None			
Constants, Assumptions, and Available Defaults				
	None			

No further explanation of variables.

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The maximum, and, in fact, only percent reduction in GHG emissions from building energy for this measure is 100 percent. This assumes that the net amount of emissions displaced by onsite renewable energy resources is equal to the number of the emissions generated annually by the building electricity use and onsite fuel consumption.

Mutually Exclusive Measures

If the user selects this measure, they may not also select Measure E-17, *Require Renewable Surplus Buildings*, which represents a unique scenario in which the project produces more renewable energy than what is required to offset the emissions generated from energy consumed by the building and would be considered carbon-negative.

Example GHG Reduction Quantification

The user avoids building energy emissions by committing their project building to be ZNE. The user would reduce GHG emissions from building energy by 100 percent.

Quantified Co-Benefits

Energy and Fuel Savings

The percent reduction in electricity from an electricity provider and fuel consumption achieved by the measure is the same as the percent reduction in GHG emissions

(A). This measure, while not resulting in a net reduction in electricity consumption per se, would displace the building electricity from the grid.

Improved Air Quality

Electricity supplied by statewide fossil-fueled or bioenergy power plants generates criteria pollutants. However, because these power plants are located throughout the state and not typically in close proximity to the ZNE building site, the reduction in electricity use from this measure will not reduce localized criteria pollutant emissions.

For projects that are all electric or replace sources of fossil fuel combustion with electric infrastructure, the reduction in onsite fuel consumption from this measure would result in local improvements in air quality because the building fuel combustion occurs on site of the project (e.g., natural gas for space heating or water heating). The percent reduction in GHG emissions (A) is the same as the percent reduction in localized criteria pollutants from building energy achieved by the measure. In other cases, projects may achieve ZNE by offsetting emissions from onsite fuel combustion sources through the export of renewable energy generated to the electric grid. If the project would retain sources of fossil fuel combustion, there would not be a 100 percent reduction in local criteria pollutant emissions. The reduction in criteria pollutant emissions (B) achieved by the measure can be calculated as follows.

Criteria Pollutant Emission Reduction Formula

$$B = -C$$

Criteria Pollutant Emission Reduction Calculation Variables

ID	Variable	Value	Unit	Source
Output				
B	Percent reduction in criteria pollutant emissions from onsite fossil fuel use	[ ]	%	calculated
User Inputs				
C	Percent reduction in onsite fossil fuel use	0–100%	%	user input
Constants, Assumptions, and Available Defaults				
	None			

Further explanation of key variables:

- (B and C) – The reduction in criteria pollutant emissions may be less than 100 percent or even 0 percent if the project retains onsite fossil fuel sources (i.e., natural gas, propane) In this situation, the percent reduction in criteria pollutant emissions is equal to the percent reduction in onsite fossil fuel use.
- Please refer to the *GHG Calculation Variables* table above for definitions of variables that have been previously defined.

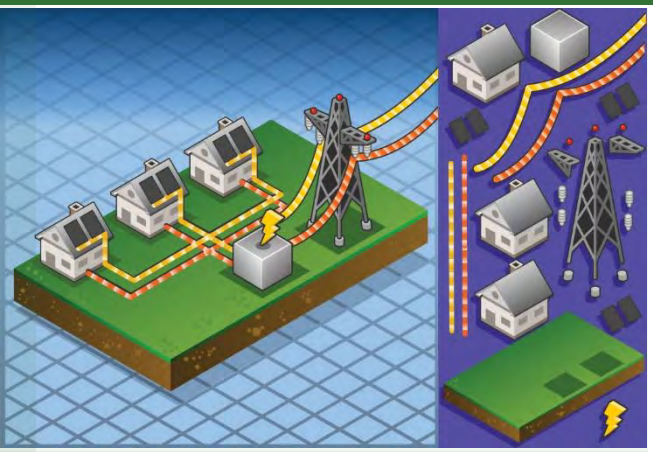
E-17. Require Renewable Surplus Buildings



GHG Mitigation Potential

Potentially large reduction in GHG emissions from building energy use

Co-Benefits (icon key on pg. 34)

Climate Resilience

Requiring renewable surplus buildings can add generation capacity to the overall grid, reducing energy costs and risk of outages.

Health and Equity Considerations

Providing surplus energy back into the grid can reduce the risk of power outages, which underserved communities are more vulnerable to because of disinvestment and historical redlining.

Measure Description

This measure will require that proposed development install onsite renewable energy in an amount that offsets more emissions than the amount generated from the development's electricity use and onsite fuel consumption. Installing zero-emission renewable energy displaces emissions from grid electricity that would otherwise be used, thereby reducing GHG emissions. Implementation of this measure would result in buildings that reduce more GHG emissions than they generate through surplus generation of energy from renewables, sometimes known as *carbon-negative buildings*. The amount of renewable energy required for a building to have net negative GHG emissions is largely determined by the number of emissions from onsite fuel consumption and the carbon intensity of the local electricity provider.

Subsector

Building Decarbonization

Scale of Application

Project/Site and Plan/Community

Implementation Requirements

Onsite renewable energy should be installed in an amount that offsets more emissions than the amount generated from the development's electricity and onsite fuel consumption. The excess renewably energy must be sold to displace non-zero emission grid electricity.

Cost Considerations

The costs associated with building only renewable-surplus structures are very high, as each building will need to be maximally energy efficient and generate renewable energy on site. However, by definition, energy costs would be entirely eliminated, and surplus energy would be sold back to the electricity provider. This is not only a cost savings, but also an additional revenue stream for each building.

Expanded Mitigation Options

When requiring development with surplus renewable generation, a best practice is to also electrify the building (see Measure E-15, *Require All-Electric Development*) so that emissions from onsite fuel consumption, such as natural gas, are eliminated.

GHG Reduction Formula

$$A = B + [(C - D) \times E \times F \times G]$$

$$A_{\%} = \frac{A - (B + C \times E \times F \times G)}{(B + C \times E \times F \times G)}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	GHG emissions from building energy	[ ]	MT CO_2e per year	calculated
$A_{\%}$	Percent reduction in GHG emissions from building energy	>100	%	calculated
User Inputs				
B	Emissions from building onsite fuel consumption	[ ]	MT CO_2e per year	user input
C	Building electricity use	[ ]	kWh per year	user input
D	Onsite renewable energy production	[ ]	kWh per year	user input
Constants, Assumptions, and Available Defaults				
E	Carbon intensity of local electricity provider	Tables E-4.3 and E-4.4	lb CO_2e per MWh	CA Utilities 2021
F	Conversion from lb to MT	0.000454	MT per lb	conversion
G	Conversion from kWh to MWh	0.001	MWh per kWh	conversion

Further explanation of key variables:

- (B) – Emissions from building onsite fuel combustion may come from natural gas, propane, or other fuels. The user should take care to properly quantify these emissions using accepted methodologies (such as CalEEMod). If the project would be an all-electric development (see Measure E-15), then there would be no onsite fuel consumption, and the value for this variable would be zero.
- (C) – It is assumed that the building electricity comes from a non–zero-emission source (e.g., grid electricity with fossil fuel mix). However, if a project would be all-electric, and the local electricity provider supplying the project's electricity sources 100 percent of its electricity from renewable energy sources, then this measure would not reduce building energy emissions, as they would already be zero. The measure would still result in the co-benefit of enhanced energy supply because it adds its energy surplus as additional capacity back to the grid.
- (D) – It is assumed that the onsite renewable energy comes from a zero-emission source (e.g., solar, wind, geothermal, biomass, eligible hydroelectric). See Measures E-10-A through E-10-C for discussion of how to calculate the energy generated from various renewable energy systems. This value should be greater than the value for (C) because the renewable energy generated will need to more than offset the electricity consumed and onsite fuel consumption.

- (E) – GHG intensity factors for major California electricity providers are provided in Tables E-4.3 and E-4.4 in Appendix C. If the project study area is not serviced by a listed electricity provider, or the user is able to provide a project-specific value (i.e., for the future year not referenced in Tables E-4.3 and E-4.4), the user should use that specific value in the GHG calculation formula. If the electricity provider is not known, a user may elect to use the statewide grid average carbon intensity.

  Note that the GHG intensity factor of electricity providers will decrease in future years as the electricity providers continue to improve their energy mix to meet the requirements of SB 100 for 50 percent carbon-free electricity by 2025, 60 percent by 2030, and 100 percent by 2045. Accordingly, this measure will reduce fewer and fewer emissions in future years as the energy it displaces becomes cleaner.

GHG Calculation Caps or Maximums

Measure Maximum

($A_{\%}$) The percent reduction in GHG emissions from building energy for this measure should be greater than 100 percent. This is based on the requirement that the displaced electricity emissions from the onsite renewable sources must exceed the combined building energy emissions from electricity and onsite fuel consumption.

Mutually Exclusive Measures

If the user selects this measure, they may not also select Measure E-16, *Require Zero Net Energy Buildings*, which represents a unique scenario in which the project produces an amount of renewable energy that displaces an equal number of emissions from building electricity and onsite fuel consumption (i.e., ZNE).

Example GHG Reduction Quantification

The user constructs onsite renewable energy infrastructure that displaces more emissions than the amount generated from electricity and onsite fuel consumption. In this example, a single-family home would be constructed in Roseville Electric's service territory and would begin operation by 2022. It would therefore have an electricity carbon intensity of 473 lb CO2e per megawatt-hour (E). If the emissions from building onsite fuel consumption are 0.1 MT CO_2e per year (B), the building electricity use is 9,000 KWh per year (C), and the onsite renewable energy production is 16,000 KWh per year (D), the mitigated emissions would be -1.4 MT CO_2e per year, or a reduction of 169 percent.

$$A = \frac{0.1\ \text{MT CO}_2\text{e}}{\text{yr}} + \left[\left(\frac{9{,}000\ \text{kWh}}{\text{yr}} - \frac{16{,}000\ \text{kWh}}{\text{yr}}\right) \times \frac{473\ \text{lb CO}_2\text{e}}{\text{MWh}} \times \frac{0.000454\ \text{MT}}{\text{lb}} \times \frac{0.001\ \text{MWh}}{\text{kWh}}\right] = \frac{\text{-1.4 MTCO}_2\text{e}}{\text{yr}}$$

$$A_{\%} = \frac{\frac{\text{-1.4 MT CO}_2\text{e}}{\text{yr}} - \left(\frac{0.1\ \text{MT CO}_2\text{e}}{\text{yr}} + \frac{9{,}000\ \text{kWh}}{\text{yr}} \times \frac{473\ \text{lb CO}_2\text{e}}{\text{MWh}} \times \frac{0.000454\ \text{MT}}{\text{lb}} \times \frac{0.001\ \text{MWh}}{\text{kWh}}\right)}{\frac{0.1\ \text{MT CO}_2\text{e}}{\text{yr}} + \frac{9{,}000\ \text{kWh}}{\text{yr}} \times \frac{473\ \text{lb CO}_2\text{e}}{\text{MWh}} \times \frac{0.000454\ \text{MT}}{\text{lb}} \times \frac{0.001\ \text{MWh}}{\text{kWh}}} = -169\%$$

Quantified Co-Benefits

Energy and Fuel Savings

This measure, while not resulting in a net reduction in electricity consumption per se, would completely displace the building electricity from the grid (C) and provide surplus generation capacity from onsite renewable sources (D).

E-18. Establish Methane Recovery in Landfills

GHG Mitigation Potential

Varies

Variable reduction in GHG emissions from landfill waste decomposition depending on the capture program and system size

Co-Benefits (icon key on pg. 34)

Climate Resilience

Establishing CH_4 recovery provides backup fuels if extreme weather events disrupt main sources of fuel.

Health and Equity Considerations

Combustion of CH_4 may increase local air pollution. Potential effects of combustion emissions on adjacent sensitive receptors needs to be evaluated during project design.

Measure Description

This measure involves the capture and treatment of landfill gas (LFG) emitted from decomposition of organic waste in landfills. Landfill gas contains about 50 percent CH_4 by volume, which has a GWP 25 times that of CO_2. This measure addresses emissions savings from LFG that is captured and either flared or combusted for energy. Flaring LFG will reduce the amount of CH_4 emitted into the atmosphere. Combusting LFG to generate electricity for onsite energy needs reduces GHG emissions in two ways: it reduces direct CH_4 emissions, and it displaces electricity demand and the associated indirect GHG emissions from electricity production. Municipal solid waste management teams should calculate the GHG savings from both flaring and combustion for energy recovery to see the relative benefits for each option.

Subsector

Methane Recovery

Scale of Application

Project/Site

Implementation Requirements

See measure description.

Cost Considerations

Landfills that have no current system for capturing CH_4 would face high installation costs for a CH_4 recovery system. Costs would be much lower for landfills that already have a system for trapping or cleaning captured gases. In California, CH_4 reclaimed from waste could represent a large additional revenue stream for landfills if the gases are managed and sold as offsets or RECs on the Low Carbon Fuel Standard or U.S. Renewable Fuel Standards markets.

Expanded Mitigation Options

Additional reductions may be achieved if the LFG is used as a transportation fuel or injected into a regional natural gas pipeline for downstream uses. Quantitative methods for these alternatives are not specifically addressed by this measure.

GHG Reduction Formula

$A1 = [(G \times O \times L) + (G \times P \times M)] \times Q$

$B = G \times N$

$A2 = B \times R \times S \times T$

$A3 = A1 + A2$

$C = [D \times [E \times I \times J \times F \times K] \times (1 - H)] \times L$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output

ID	Variable	Value	Unit	Source
O	CH_4 emission factor for LFG combustion	0.001552	g CH_4 per scf	U.S. EPA 2018
P	N_2O emission factor for LFG combustion	0.000306	g N_2O per scf	U.S. EPA 2018
Q	Conversion from g to MT	10^{-6}	MT per g	conversion
R	MWh to MMBTU	3.412142	MWh per MMBtu	conversion
S	Carbon intensity of local electricity provider	Table E-4.3 and E-4.4	lb CO_2e per MWh	CA Utilities 2021
T	Conversion from lb to MT	0.000454	MT per lb	conversion

Further explanation of key variables:

- (E) – The CH_4 correction factor accounts for CH_4 generation from managed or unmanaged landfills. For example, unmanaged landfills produce less CH_4 from a given amount of waste than managed landfills because a larger fraction of waste decomposes aerobically in the top layers of a landfill.
  - Managed = 1.0
  - Unmanaged (≥5 meter (m) deep) = 0.8
  - Unmanaged (<5 m deep) = 0.4
  - Uncategorized = 0.6
- (C) – The generation potential follows the IPCC 2007 "good practices" guidelines for estimating CH_4 emissions for a landfill that does not have LFG capture technology.
- (F) – The fraction of CH_4 in landfill gas is based on the organic matter content of the landfill. This fraction can range from 0.4 to 0.6, but the default is usually taken as 0.5.
- (I) – CalRecycle published a 2016 study on the composition of California's overall disposed waste stream. From this study, an average California DOC was calculated to determine organic content of waste in landfills.
- (D) – This input is the amount of waste that the user will know will have some amount of LFG capture technology.

GHG Calculation Caps or Maximums

None.

Example GHG Reduction Quantification

In this example, a user decides to implement an LFG capture program and use the LFG to produce energy to offset utility electricity usage. The landfill contains 1,000 short tons of waste, is managed and has 0.5 fraction of CH_4 in the LFG with a 75 percent collection efficiency. Twenty million scf LFG was combusted. The project is in Redding Electric Utility's service territory and would begin operation by 2024. It would therefore have an electricity carbon intensity of 341 lb CO_2e per MWh (S). This example scenario results in a total net GHG reduction (A3) of 5,126.6 MT CO_2e.

$$A1 = \left[\left(\textbf{20,000,000 scf} \times 0.001552 \frac{g\ CH_4}{scf} \times 25\right) + \left(\textbf{20,000,000 scf} \times 0.000306 \frac{g\ N_2O}{scf} \times 298\right)\right] \times 10^{-6} = 2.6\ MT\ CO_2e$$

$$B = \textbf{20,000,000 scf} \times 0.000485 \frac{MMBtu}{scf} = 9{,}700\ MMBtu$$

$$A2 = 9{,}700\ MMBtu \times 3.412142 \frac{MWh}{MMBtu} \times 341 \frac{lb}{MWh} \times 0.000454 \frac{MT}{lb} = 5{,}124\ MT\ CO_2e$$

$$A3 = 2.6\ MT\ CO_2e + 5{,}124\ MT\ CO_2e = 5{,}126.6\ MT\ CO_2e$$

$$C = \left[\textbf{1,000 tons} \times \left[1 \times 19.8\% \times 0.6 \times \textbf{0.5} \times \frac{16}{12} \frac{g\ CH_4}{g\ C}\right] \times (1 - 0.1)\right] \times 25 = 1{,}782\ MTCO_2e$$

Quantified Co-Benefits

Energy and Fuel Savings

Energy savings from flaring or combustion of LFG for energy are calculated above as (B).

E-19. Establish Methane Recovery in Wastewater Treatment Plants

GHG Mitigation Potential

Potentially large reduction in GHG emissions from plant operations

Co-Benefits (icon key on pg. 34)

Climate Resilience

Establishing CH_4 recovery provides backup fuels if extreme weather events disrupt main sources of fuel.

Health and Equity Considerations

Combustion of CH_4 may increase air pollution. Potential effects of combustion emissions on adjacent sensitive receptors needs to be evaluated during project design.

Measure Description

This measure requires capturing CH_4 from an existing wastewater treatment plant and either (1) combusting or flaring it to prevent escape into the atmosphere or (2) combusting or flaring it and using the heat to generate electricity for onsite energy needs. Using the combusted CH_4 as an energy source reduces GHG emissions by displacing electricity demand and the associated indirect GHG emissions from electricity production. This measure is most applicable to wastewater treatment plants that have anaerobic digestion infrastructure, which facilitates the biological decomposition of the wastewater and produces the CH_4 that is either flared or harnessed for energy.

Subsector

Methane Recovery

Scale of Application

Project/Site

Implementation Requirements

See measure description. Also, this measure may not be appropriate for wastewater treatment plants that use lagoons to process wastewater.

Cost Considerations

Wastewater treatment plants that have no current system for capturing CH_4 would face high installation costs for a CH_4 recovery system. Costs would be lower for plants that already have a system for trapping or cleaning captured gases. In California, CH_4 reclaimed from wastewater treatment could represent a large additional revenue stream for the plants if the gases are managed and sold as offsets or RECs on the Low Carbon Fuel Standard or U.S. Renewable Fuel Standards markets.

Expanded Mitigation Options

Additional reductions may be achieved if the CH_4 is processed and used as a transportation fuel or injected into a regional natural gas pipeline for downstream uses. Captured waste biogas may also be used to support the production of biodegradable biopolymers, which serve as natural alternatives to conventional plastics.

GHG Reduction Formula

$A1 = C \times [D - (E \times F \times G \times H \times (1 - I) \times J \times K \times L)]$ (Emissions Reduction)

$B = (C \times E \times F \times G \times M \times N \times O)$ (Energy Savings, if applicable)

$A2 = B \times P \times Q \times R$ (Additional Emissions Reduction, if applicable)

$A3 = A1 + A2$ (Total Net Emissions Reduction)

$A4 = \frac{A3}{C \times D}$ (% Reduction)

GHG Calculation Variables

R	Conversion from lb to MT	0.000454	MT per lb	conversion

Further explanation of key variables:

- (A1) – The emissions calculated for this variable represent the emissions reduction that is achieved from the combustion of CH_4. Combusting the CH_4 prevents it from entering the atmosphere; however, during the combustion process, some fraction of CH_4 is not fully combusted and can leak into the atmosphere. The formula for this variable accounts for the fraction that is not fully combusted.
- (B) – This variable represents the energy savings that result from the combustion of CH_4 and then using the heat produced to generate energy. If CH_4 will only be combusted or flared but not used for energy, then there would not be energy savings for this measure. The user should set this variable to zero if there will be no energy generation.
- (A2) – The emissions reductions calculated for this variable represent the emissions that are offset from the generation of energy from the captured CH_4 instead of from typical fossil fuel sources. Combusting the CH_4 avoids the need for fossil fuel sources of energy that would have been generated in the absence of this measure.
- (A3) – The net emissions reductions achieved by this measure are calculated in this variable.
- (D) – The factors represent the emissions per liter of wastewater that is treated at facilities with either primary treatment or without primary treatment. These values are as follows.
  - Primary treatment factor: 1.93 x 10-6
  - Without primary treatment factor: 2.85 x 10^{-6}
- (E) – The digester gas variable represents the amount of digester gas that is generated per gal of wastewater. The value given here is determined by assumptions from the U.S. EPA's GHG inventory, with the amount of digester gas generated per person per day is 1 cubic foot and the amount of wastewater generated per person per day is 100 gallons (gal) (for publicly owned treatment works). Dividing these values (1/100) is equal to 0.01 cubic feet of digester gas per gal of wastewater.

GHG Calculation Caps or Maximums

None.

Example GHG Reduction Quantification

The user implements CH_4 capture and energy generation infrastructure at an existing wastewater treatment plant that processes 100 million liters of wastewater per year. The existing plant currently has primary treatment. The project is in the Silicon Valley Power's service territory, and the selected electricity provider emission factor is for the year 2026 (224 lb CO_2e per MWh) (Q). The example measure emission reduction is calculated below.

$$B = \left(100\times10^{6}\ \text{liters} \times \frac{0.26417\ \text{gal}}{\text{liter}} \times 0.01\frac{\text{ft}^3}{\text{gal}} \times 0.65 \times \frac{1{,}028\ \text{BTU}}{\text{ft}^3\ \text{CH4}} \times \frac{0.000293\ \text{kWh}}{\text{BTU}} \times 0.85\right) = 43{,}962\ \text{kWh}$$

$$A1 = 100\times10^{6}\ \text{liters} \times \left[1.93\times10^{-6}\frac{\text{MT CH}_4}{\text{liter}} - \left(\frac{0.26417\ \text{gal}}{\text{liter}} \times 0.01\frac{\text{ft}^3}{\text{gal}} \times 0.65 \times 662\frac{\text{g CH}_4}{\text{m}^3\ \text{CH}_4} \times (1 - 0.99) \times \frac{0.02832\ \text{m}^3}{\text{ft}^3} \times \frac{10^{-6}\ \text{MT}}{\text{g}} \times 25\right)\right] = 192\ \text{MT CO}_2\text{e}$$

$$A2 = 43{,}962\ \text{kWh} \times 0.001\frac{\text{MWh}}{\text{kWh}} \times 224 \times 0.000454\frac{\text{MT}}{\text{lb}} = 4\ \text{MT CO}_2\text{e}$$

$$A3 = 192\ \text{MT CO}_2\text{e} + 4\ \text{MT CO}_2\text{e} = 196\ \text{MT CO}_2\text{e}$$

$$A4 = \frac{196\ \text{MT CO}_2\text{e}}{100\times10^{6}\ \text{liters} \times 1.93 \times 10^{-6}\frac{\text{MT CO}_2\text{e}}{\text{liter}}} = 102\%$$

Quantified Co-Benefits

Successful implementation of this measure could achieve energy savings if the user's project includes CH_4-based energy generation infrastructure. This quantified co-benefit is derived in the steps above that are necessary to quantify GHG reductions.

Water

Energy used to pump, treat, and convey water generates GHG emissions and is the primary source of GHG emissions within the water sector. The amount of energy required depends on both the volume of water and energy intensity associated with the water source. For example, it generally takes less energy to pump and convey water from a local source than to transport water across long distances. California's water supply is diverse and comprised of groundwater, surface water, and reservoirs, with some water transport occurring over long distances and over varied terrain. Treating water so that it is potable for human use and processing wastewater also generates GHG emissions.

Indirect GHG emissions associated with water use can be decreased by reducing water demand and/or by using a less energy-intensive water source. A project can reduce its indoor water demand by installing low-flow and high-efficiency water fixtures and appliances, such as toilets, showerheads, faucets, clothes washers, and dishwashers. A reduction in outdoor water demand can be achieved by designing water-efficient landscapes that include plants with relatively low watering needs; minimizing areas of water-intensive turf; and installing smart irrigation systems to avoid excessive water use. These and other strategies could be combined into a water conservation strategy with a water reduction performance target. Less energy-intensive water sources include reclaimed and grey water, as well as locally sourced water (e.g., nearby groundwater basins, nearby surface water, and gravity-dominated systems).

Emission reductions achieved by reduced water demand will be directly proportional to the decrease in demand. Use of less energy-intensive water sources will decrease energy-related emissions, but these systems may also require energy to successfully operate. Resources and methods to quantify emissions reductions from measures that reduce water demand and/or target use of a less energy-intensive water source are described in this section. Use the graphic on the right to click on an individual measure to navigate directly to the measure's factsheet.

W-1. Use Reclaimed Non-Potable Water

GHG Mitigation Potential

Small

Potentially small reduction in GHG emissions from outdoor water use

Co-Benefits (icon key on pg. 34)

Climate Resilience

Using reclaimed non-potable water conserves water resources, which will become more strained under climate change, and provides a backup water source should extreme events disrupt current sources. This could also reduce costs associated with obtaining fresh potable water from distant sources.

Health and Equity Considerations

The project will provide appropriate education on non-potable water for project residents/employee.

Measure Description

This measure requires use of reclaimed water for outdoor uses. Reclaimed water is water reused for non-potable uses (e.g., landscape irrigation) after wastewater treatment instead of returning the water to the environment (i.e., discharging into rivers and other bodies of water). Using water after it has been treated requires substantially less energy to deliver it to users than fresh water from distant sources and, therefore, reduces GHG emissions. The use of reclaimed water is typically designated for non-potable uses, such as landscaping and other outdoor uses.

Although wastewater treatment processes have improved, there has been limited implementation of reclaimed water projects for household or potable uses. Furthermore, the treatment of wastewater to produce potable water (often through reverse osmosis) is usually energy-intensive and thus may not result in reduction in energy consumption and associated GHG emissions.

Scale of Application

Project/Site

Implementation Requirements

See measure description.

Cost Considerations

Initial costs of altering a system, whether it is irrigation, plumbing, or cleaning, to use reclaimed non-potable water will vary with the source of the water and the use; however, all applications will have costs associated with installing water collection and distribution infrastructure.

Expanded Mitigation Options

This measure does not include treatment of wastewater for potable uses, although the approach to assessing the potential change in GHG emissions would be the same.

GHG Reduction Formula

$A1 = C1 \times (D - E)$ (Energy savings)

$B1 = A1 \times F \times G \times H$ (Emissions reduction)

$B2 = C2 \times \frac{D-E}{D}$ (Percent emissions reduction)

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A1	Energy savings from using reclaimed water	[ ]	kWh	calculated
B1	GHG reduction from using reclaimed water	[ ]	MT CO_2e	calculated
B2	% GHG reduction from outdoor water use	[ ]	%	calculated
User Inputs				
C1	Amount of water to be used from reclaimed sources	[ ]	acre-feet (AF)	user input
C2	Percentage of water from reclaimed water (relative to total outdoor water demand)	[ ]	%	user input
Constants, Assumptions, and Available Defaults				
D	Electricity for municipally provided water	Table W-1.1	kWh per AF	CPUC 2016
E	Fraction of electricity for reclaimed water	Table W-1.1	kWh per AF	CPUC 2016
F	Conversion from kWh to MWh	0.001	MWh per kWh	conversion
G	Carbon intensity of electricity provider	Tables E-4.3 and E-4.4	lb CO_2e per MWh	CA Utilities 2021
H	Conversion from pounds (lb) to MT	0.000454	MT per lb	conversion

Further explanation of key variables:

- (C1) – The amount of water to be used from reclaimed water must be provided by the user.
- (D, E) – The water energy-intensity factors are derived from the most recent version of the California Public Utilities Commission (CPUC) Water Energy Calculator and are provided in Table W-1.1 in Appendix C, *Emission Factors and Data Tables* (CPUC 2016). The energy intensity factors rely on region-wide average values for the California Department of Water Resources' (DWR) 10 hydrologic regions. Following wastewater treatment, reclaimed water would be pre-treated (to meet standards) and distributed back to an end use (e.g., city park). Accordingly, the fraction of energy required to provide reclaimed water can be determined by consulting Table W-1.1 and identifying the columns for pre-treatment and water distribution (omit the column for extraction and conveyance).

- (G) – GHG intensity factors for major utilities in California are provided in Tables E-4.3 and E-4.4 in Appendix C. If the project study area is not serviced by the listed electricity provider, or the user is able to provide a project-specific value (i.e., for the future year in which the reclaimed water system would be established), the user should replace these defaults in the electricity consumption GHG calculation formula.

GHG Calculation Caps or Maximums

None.

Example GHG Reduction Quantification

The user reduces GHG emissions from water-related electricity by using reclaimed water for non-potable uses in place of fresh water. In this example, the project is in the San Joaquin River hydrologic region and includes the use of 31 AF per year of reclaimed water (C1), which represents 80 percent of the project's total outdoor water demand (C2). The electricity provider for the project area is Turlock Irrigation District and the analysis year is 2027. The carbon intensity of electricity is therefore 296 lb CO_2e per MWh (G).

$$A1 = \mathbf{31\ AF} \times \left(252\frac{kWh}{AF} - 163\frac{kWh}{AF}\right) = 2{,}759\ kWh$$

$$B1 = 2{,}759\ kWh \times 0.001\frac{MWh}{kWh} \times 296\frac{lb\ CO_2e}{MWh} \times 0.000454\frac{MT}{lb} = 0.4\ MT\ CO_2e$$

$$B2 = \mathbf{80\%} \times \frac{\left(252\frac{kWh}{AF} - 163\frac{kWh}{AF}\right)}{252\frac{kWh}{AF}} = 28\%$$

Quantified Co-Benefits

Energy and Fuel Savings

Energy savings (A1) are derived in the steps above that are necessary to quantify GHG reductions.

Water Conservation

This measure would not necessarily change water consumption, but it would result in conservation of fresh water sources by using reclaimed water. This quantity of freshwater savings is equal to the amount of reclaimed water (C1).

W-2. Use Grey Water

GHG Mitigation Potential

Potentially small reduction in GHG emissions from outdoor water use

Co-Benefits (icon key on pg. 34)

Climate Resilience

Using grey water conserves water resources, which will become more strained under climate change, and provides a backup water source should extreme events disrupt current sources. This could also reduce costs associated with obtaining fresh potable water from distant sources.

Health and Equity Considerations

The project should provide appropriate education on grey water for project residents and employees.

Measure Description

This measure requires the use of grey water for outdoor uses. *Grey water* is water from sinks, showers, tubs, and washing machines that has not contacted biological pathogens. Grey water offsets freshwater that would need to be extracted or sourced for the same demand, resulting in water and GHG emissions savings. The energy associated with grey water use is essentially negligible as it is used on site for a second time and does not require major pumping equipment or further treatment.

Scale of Application

Project/Site

Implementation Requirements

Grey water should only be used for non-potable applications, such as landscaping and other outdoor uses, because grey water does not undergo water treatment before being used for the second time.

Cost Considerations

Initial costs of altering the plumbing of a property to use grey water will vary with the property type; however, all applications will have costs associated with installing water collection, storage, and distribution infrastructure. These costs would be offset by reductions in freshwater use, as well as reduce energy requirements for water treatment and waste management.

Expanded Mitigation Options

For grey water sourced from sinks, it is best practice not to use water with greasy and oily substances, such as runoff from kitchen sinks with leftover oils, meat scraps, and dairy products.

GHG Reduction Formula

$A1 = (D \times E + D \times F) \times G \times H$ (Water savings, if not known by user)

$B = A1 \times ((I + J) - K)$ (Energy savings)

$C1 = B \times L \times M \times N$ (Emissions reduction)

$C2 = A2$ (Percent emissions reduction)

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A1	Outdoor water savings from using grey water	[ ]	AF	calculated
B	Energy savings from using grey water	[ ]	kWh	calculated
C1	GHG reduction from using grey water	[ ]	MT CO_2e	calculated
C2	% GHG reduction from outdoor water use	[ ]	%	calculated
User Inputs				
A2	Percentage of water from grey water sources (relative to total outdoor water demand)	[ ]	%	user input
D	Number of residents in homes with grey water systems	[ ]	occupants	user input
Constants, Assumptions, and Available Defaults				
E	Gal per day per occupant from showers, bathtubs, and lavatories	25	gal per day per occupant	CA Code 2019
F	Gal per day per occupant for laundry	15	gal per day per occupant	CA Code 2019
G	Days per year	365	days per year	conversion
H	Conversion from gal to AF	3.07×10^{-6}	AF per gal	conversion
I	Electricity required for municipally provided water	Table W-1.1	kWh per AF	CPUC 2016
J	Electricity required for wastewater treatment following municipal use	418	kWh per AF	CPUC 2016
K	Fraction of electricity for grey water	0	kWh per AF	assumption
L	Conversion from kWh to MWh	0.001	MWh per kWh	conversion
M	Carbon intensity of local electricity provider	Tables E-4.3 and E-4.4	lb CO_2e per MWh	CA Utilities 2021
N	Conversion from lb to MT	0.000454	MT per lb	conversion

Further explanation of key variables:

- (A1) – If the user knows how much grey water will be used for their project, that amount should be used to determine GHG reductions. If it is not known, however, the formula for A1 can be used to estimate the volume of grey water at residential uses, based on the 2019 California Plumbing Code.
- (I, K, J) – The water energy-intensity factors are derived from the most recent version of the CPUC Water Energy Calculator and are provided in Table W-1.1 in Appendix C (CPUC 2016). The energy intensity factors rely on region-wide average values for DWR's 10 hydrologic regions. Because grey water is reused on site, it avoids energy after initial water consumption for at least once use cycle (i.e., wastewater treatment and extraction, conveyance, pre-treatment, and distribution energy for an equivalent volume of water).
- (M) – GHG intensity factors for major utilities in California are provided in Tables E-4.3 and E-4.4 in Appendix C. If the project study area is not serviced by the listed electricity provider, or the user is able to provide a project-specific value (i.e., for the future year in which the grey water system would be established), the user should replace these defaults in the electricity consumption GHG calculation formula.

GHG Calculation Caps or Maximums

None.

Example GHG Reduction Quantification

The user reduces GHG emissions from water-related electricity by using grey water for non-potable uses in place of fresh water. In this example, the project in the South Coast hydrologic region and includes 300 residents. These residents would produce about 13.4 AF of water, which the user has determined is equal to 20 percent of the project's total water demand (A2). The electricity provider for the project area is City of Riverside and the analysis year is 2024. The carbon intensity of electricity is therefore 789 lb CO_2e per MWh (L).

$$A1 = \left(300 \times 25\frac{\text{gal}}{\text{day·resident}} + 300 \times 15\frac{\text{gal}}{\text{day·resident}}\right) \times 365\frac{\text{days}}{\text{year}} \times \left(3.07\times10^{-6}\frac{\text{AF}}{\text{gal}}\right) = 13.4 \text{ AF}$$

$$B = 13.4 \text{ AF} \times \left(\left(1{,}898\frac{\text{kWh}}{\text{AF}} + 418\frac{\text{kWh}}{\text{AF}}\right) - 0\frac{\text{kWh}}{\text{AF}}\right) = 31{,}034 \text{ kWh}$$

$$C1 = 31{,}034 \text{ kWh} \times 0.001\frac{\text{MWh}}{\text{kWh}} \times 789\ \frac{\text{lb } CO_2e}{\text{MWh}} \times 0.000454\frac{\text{MT}}{\text{lb}} = 11.1 \text{ MT } CO_2e$$

$$C2 = 20\%$$

Quantified Co-Benefits

Energy and Fuel Savings

Energy savings (B) are derived in the steps above that are necessary to quantify GHG reductions.

Water Conservation

This measure would not necessarily change water consumption, but it would result in conservation of fresh water sources by using grey water. This quantity of freshwater savings is equal to the amount of grey water (A1).

Sources

W-3. Use Locally Sourced Water Supply

GHG Mitigation Potential

Potentially moderate reduction in GHG emissions from water use

Co-Benefits (icon key on pg. 34)

Climate Resilience

Using locally sourced water provides fewer opportunities for extreme events to disrupt the water source due to shorter traveling times. This could also reduce costs associated with obtaining fresh potable water from distant sources.

Health and Equity Considerations

Locally sourced water may have more contaminants than imported options. For potable uses, carefully consider the water quality of the proposed source.

Measure Description

This measure requires use of local water supplies instead of more distant water supplies. Locally sourced water is typically less energy intensive because it does not need to be moved across long distances (unless locally sourced water requires extensive pretreatment to address water quality concerns). Using locally sourced water can thus avoids the higher GHG emissions from energy consumed to pump and move water through larger infrastructure systems, such as the State Water Project.

Scale of Application

Plan/Community

Implementation Requirements

See measure description.

Cost Considerations

Prioritizing locally sourced water reduces costs associated with the transportation of water to the use location. However, regions that are not already large-scale water producers will most likely require significant investment in water extraction, processing, management, and potentially reuse in order to meet demand.

Expanded Mitigation Options

Install onsite water collection systems, such as a rain barrels or cisterns, for even more local water supply, reducing the associated energy and GHG emissions from water transmission.

GHG Reduction Formula

$A1 = C1 \times (D - E)$ (Energy savings)

$B1 = A1 \times F \times G \times H$ (Emissions reduction)

$B2 = C2 \times \frac{D-E}{D}$ (Percent emissions reduction)

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A1	Energy savings from using local water	[ ]	kWh	calculated
B1	GHG reduction from using local water	[ ]	MT CO_2e	calculated
B2	% GHG reduction from outdoor water use	[ ]	%	calculated
User Inputs				
C1	Amount of water to be obtained from local sources	[ ]	AF	user input
C2	Percentage of water from local sources (relative to total water demand)	[ ]	%	user input
E	Electricity required to treat and distribute local water	[ ]	kWh/AF	user input
Constants, Assumptions, and Available Defaults				
D	Electricity for municipally provided water	Table W-1.1	kWh per AF	CPUC 2016
F	Conversion from kWh to MWh	0.001	MWh per kWh	conversion
G	Carbon intensity of local electricity provider	Tables E-4.3 and E-4.4	lb CO_2e per MWh	CA Utilities 2021
H	Conversion from lb to MT	0.000454	MT per lb	conversion

Further explanation of key variables:

- (E) – The water energy-intensity factor for the local water source must be defined by the user.
- (D) – The water energy-intensity factors are derived from the most recent version of the CPUC Water Energy Calculator and are provided in Table W-1.1 in Appendix C (CPUC 2016). The energy intensity factors rely on region-wide average values for DWR's 10 hydrologic regions.
- (G) – GHG intensity factors for major utilities in California are provided in Tables E-4.3 and E-4.4 in Appendix C. If the project study area is not serviced by the listed electricity provider, or the user is able to provide a project-specific value (i.e., for the future year in which the project begins local water use), the user should replace these defaults in the electricity consumption GHG calculation formula.

GHG Calculation Caps or Maximums

None.

Example GHG Reduction Quantification

The user reduces GHG emissions from water-related electricity by using locally sourced water. In this example, the project is in the South Coast hydrologic region and uses 46 AF per year of water. The user chooses to supply 100 percent of the water for the project (C1, C2) from an alternative local source that has a water energy-intensity of 1,200 kWh per AF (E). The electricity provider for the project area is Burbank Water and Power and the analysis year is 2029. The carbon intensity of electricity is therefore 218 lbs CO_2e per MWh (G).

$$A1 = \mathbf{46\ AF} \times \left(1{,}898\,\frac{\text{kWh}}{\text{AF}} - \mathbf{1{,}200}\ \frac{\mathbf{kWh}}{\mathbf{AF}}\right) = 32{,}108\ \text{kWh}$$

$$B1 = 32{,}108\ \text{kWh} \times 0.001\,\frac{\text{MWh}}{\text{kWh}} \times 218\ \frac{\text{lb}\ CO_2e}{\text{MWh}} \times 0.000454\,\frac{\text{MT}}{\text{lbs}} = 3.2\ \text{MT}CO_2e$$

$$B2 = \mathbf{100\%} \times \frac{1{,}898\,\frac{\text{kWh}}{\text{AF}} - \mathbf{1{,}200}\,\frac{\mathbf{kWh}}{\mathbf{AF}}}{1{,}898\,\frac{\text{kWh}}{\text{AF}}} = 37\%$$

Quantified Co-Benefits

Energy and Fuel Savings

Energy savings (A1) are derived in the steps above that are necessary to quantify GHG reductions.

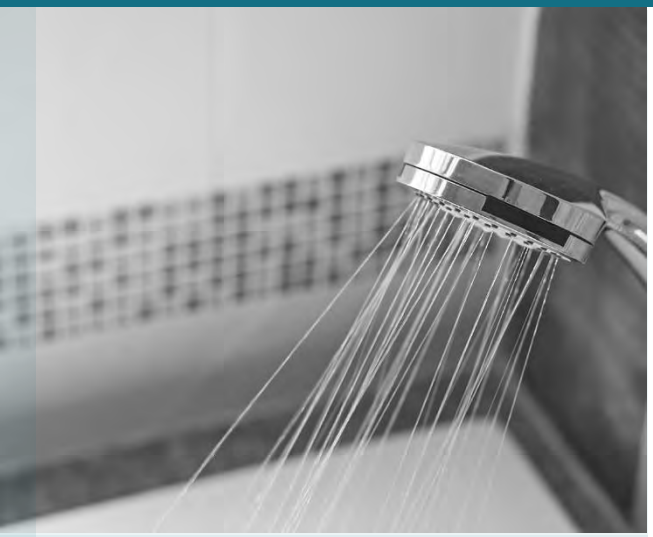
W-4. Require Low-Flow Water Fixtures



GHG Mitigation Potential

Potentially small reduction in GHG emissions from indoor water use

Co-Benefits (icon key on pg. 34)

Climate Resilience

Using low-flow water fixtures conserves water resources, which will become more strained under climate change.

Health and Equity Considerations

Low-flow and high-efficiency water fixtures can help to reduce water utility bill costs for project residents.

Measure Description

This measure requires use of low-flow or high-efficiency water fixtures in residential and non-residential buildings. Low-flow and high-efficiency fixtures may include toilets, urinals, showerheads, faucets, clothes washers, and dishwashers. These fixtures use less water than their traditional counterparts and, therefore, reduce energy and indirect GHG emissions that result from sourcing and transporting fresh water.

Scale of Application

Project/Site

Implementation Requirements

Install low-flow or high-efficiency fixtures that exceed state standards in any of the following: toilets, urinals, showerheads, faucets, clothes washers, and dishwashers.

Cost Considerations

Low-flow water fixtures tend to be slightly more expensive to purchase and install than less efficient models; however, these costs are almost immediately offset by large savings in water and energy consumption.

Expanded Mitigation Options

Install low-flow or high-efficiency water fixtures that perform better than the minimum efficiency standard established by ENERGY STAR, reducing the associated energy use and GHG emissions.

GHG Reduction Formula

$$A1 = \sum (D1 \times Ez \times \frac{Fz-Gz}{Fz}) \text{ or } = \sum (D1 \times Hz) \quad \text{(Water savings)}$$

$$A2 = \frac{A1}{D1} \text{ or } = \frac{D1-D2}{D1} \quad \text{(Percent emissions reduction)}$$

$$B = A1 \times I \times (J + K) \quad \text{(Energy savings)}$$

$$C = B \times L \times M \times N \quad \text{(Emissions reduction)}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A1	Indoor water savings with low-flow fixtures	[ ]	AF	calculated

N	Conversion from lb to MT	0.000454	MT per lb	conversion
z	End use or type of fixture	N/A	-	-

Further explanation of key variables:

- (Ez) – For residential uses, the percentages of indoor water that is typically used for the most common end uses are shown in Table W-4.1 in Appendix C. For non-residential uses, the percentages of total and indoor water that is typically used for the most common end uses are shown in Table W-4.2 in Appendix C. To calculate the water savings for this measure relative to total or indoor use, the user should multiply the savings rate from a given fixture (e.g., kitchen faucet) by the percentage of water that is used in kitchen faucets for a typical residential or non-residential use.
- (Fz) – The current (2019) California Plumbing Code water use flow rates for common fixtures are provided in Table W-4.3 (for residential uses) and Table W-4.4 (for non-residential uses) in Appendix C. The user can use a specific existing flow rate if the flow rate for the end use or fixture differs from the 2019 code.
- (Gz) – The reduced water use flow rate for common fixtures in provided in Table W-4.3 (for residential uses) and Table W-4.4 (for non-residential uses). These reduced rates assume implementation of voluntary measures from the 2019 California Green Building Code or EnergyStar certification, which goes beyond the current (2019) California Plumbing Code. The user can use a specific reduced flow rate if the flow rate for the end use or fixture differs from the rates shown in Tables W-4.3 or W-4.4.
- (Hz) – This variable is the percent water savings from using a fixture with improved water efficiency, relative to the existing rate for that fixture. If the user knows what the percent savings is for their fixtures, the equation above with variable Hz can be used.
- (J) – The water energy-intensity factors are derived from the most recent version of the CPUC Water Energy Calculator and are provided in Table W-1.1 in Appendix C (CPUC 2016). The energy intensity factors assume that all water is treated to potable standards and rely upon region-wide average values for DWR's 10 hydrologic regions.
- (K) – For this measure, water conservation would affect indoor water consumption. Because indoor water is sent to wastewater treatment plants, it is necessary to account for the energy that would be avoided at the wastewater treatment plant. The value of 418 kWh/AF is based on the CPUC Water Energy Calculator (CPUC 2016).
- (M) – GHG intensity factors for major utilities in California are provided in Tables E-4.3 and E-4.4 in Appendix C. If the project study area is not serviced by the listed electricity provider, or the user is able to provide a project-specific value, the user should replace these defaults in the electricity consumption GHG calculation formula.

GHG Calculation Caps or Maximums

None.

Example GHG Reduction Quantification

The user reduces GHG emissions from water-related electricity by requiring low-flow fixtures. In this example, the project is a non-residential office use located in Central Coast hydrologic region with a total indoor water demand of 10 million gal per year (D1). The user is proposing to upgrade the toilets and bathroom faucets per the 2019 California Green Building Code Voluntary Measures. Accordingly, the following assumptions are obtained from Tables W-4.2 and W-4.4 in Appendix C:

- Percent of indoor water used for toilets (Ez) = 48 percent.
- Percent of indoor water used for bathroom faucets (Ez) = 3 percent.
- Current state standard water flow rate for toilets (Fz) = 1.28 gal per flush.
- Current state standard water flow rate for toilets (Fz) = 0.5 gal per minute.
- Reduced water flow rate for toilets (Fz) = 1.12 gal per flush.
- Reduced water flow rate for toilets (Fz) = 0.35 gal per minute.

The project is in the San Francisco Bay hydrologic region, the electricity provider is My Choice Energy (MCE), and the analysis year is 2026. The carbon intensity of electricity is therefore 184 lb CO_2e per MWh (G).

$$A1 = \left[\left(10\times10^6\ \text{gal} \times 48\%(\text{toilet}) \times \frac{1.28(\text{toilet}) - 1.12(\text{toilet})}{1.28(\text{toilet})}\right) + \left(10\times10^6\ \text{gal} \times 3\%(\text{bathroom faucet}) \times \frac{0.5(\text{bathroom faucet}) - 0.35(\text{bathroom faucet})}{0.5(\text{bathroom faucet})}\right)\right]$$

$$= 690{,}000\ \text{gal}$$

$$A2 = \frac{690{,}000\ \text{gal}}{10\times10^6\ \text{gal}} = 7\%$$

$$B = 690{,}000\ \text{gal} \times \left(3.07\times10^{-6}\ \frac{\text{AF}}{\text{gal}}\right) \times \left(695\ \frac{\text{kWh}}{\text{AF}} + 418\ \frac{\text{kWh}}{\text{AF}}\right) = 2{,}358\ \text{kWh}$$

$$C = 2{,}358\ \text{kWh} \times 0.001\ \frac{\text{MWh}}{\text{kWh}} \times 184\ \frac{\text{lb } CO_2e}{\text{MWh}} \times 0.000454\ \frac{\text{MT}}{\text{lb}} = 0.2\ \text{MT } CO_2e$$

Quantified Co-Benefits

Energy and Fuel Savings

Energy savings (B) are derived in the steps above that are necessary to quantify GHG reductions.

Water Conservation

Water savings (A1) are derived in the steps above that are necessary to quantify GHG reductions.

W-5. Design Water-Efficient Landscapes

GHG Mitigation Potential

Potentially small reduction in GHG emissions from outdoor water use

Co-Benefits (icon key on pg. 34)

Climate Resilience

Designing water-efficient landscapes conserves water resources, which will become more strained under climate change. In addition, native landscaping can help to support biodiversity and pollinators.

Health and Equity Considerations

Water-efficient landscaping can lower utility costs for project residents, and reduce pesticide and fertilizer run-off, which can affect water quality.

Measure Description

This measure requires the use of landscapes that are water efficient, with lower water demands than required by the DWR 2015 Model Water Efficient Landscape Ordinance (MWELO) (California Code of Regulations [C.C.R.], Title 23, Division 2, Chapter 2.7). Designing water-efficient landscapes for a project site or throughout a community reduces water consumption and thus the corresponding energy and indirect GHG emissions that result from sourcing and transporting fresh water.

Scale of Application

Project/Site and Plan/Community

Implementation Requirements

Relative to the maximum allowable water use under the MWELO, users can achieve water savings by reducing lawn sizes, planting vegetation with minimal water needs (e.g., California native species), choosing vegetation appropriate for the climate of the project site or community, or choosing complementary plants that have similar water needs or that can provide shade and/or water to each other.

Cost Considerations

Water-efficient landscapes save money not only through reduced requirements for irrigation, but also require fewer inputs like fertilizer and pesticides and less use of landscaping equipment. Depending on the area of the landscape and the cost of designing it for water efficiency, these cost savings usually recoup the cost of installation and design.

Expanded Mitigation Options

Pair with Measure W-6 for increased outdoor water conservation and GHG reductions. Encourage application of biochar to improve soil quality and enhance carbon sequestration. Incorporate low-impact development practices in the landscape and surrounding area.

GHG Reduction Formula

$$A1 = ([(D \times E) + ((1 - D) \times F)] - (\frac{G}{H} \times E)) \times I \times J \quad \text{(Water savings)}$$

$$A2 = 1 - A1/[((D \times E) + ((1 - D) \times F)) \times I \times J] \quad \text{(Percent emissions reduction)}$$

$$B = A1 \times K \times L \quad \text{(Energy savings)}$$

$$C = B \times M \times N \times O \quad \text{(Emissions reduction)}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A1	Outdoor water savings with water-efficient landscapes	[ ]	gal	Calculated
A2	% reduction in outdoor water, energy & GHG emissions with water-efficient landscapes	[ ]	%	Calculated
B	Energy savings with water-efficient landscapes	[ ]	kWh	Calculated
C	GHG reduction with water-efficient landscapes	[ ]	MT CO_2e	Calculated
User Inputs				
D	Evapotranspiration adjustment factor for maximum allowable water use	0.55 or 0.45	unitless	user input
E	Landscape area	[ ]	sf	user input
F	Special landscape area	[ ]	sf	user input
Constants, Assumptions, and Available Defaults				
G	Plant factor	0 to 1.0	unitless	UC Davis 2021a
H	Irrigation efficiency	0.75 or 0.81	unitless	23 C.C.R. Appendix A
I	Evapotranspiration rate	[ ]	Inches per year	23 C.C.R. Appendix A
J	Conversion from acre-inches/acre to gal/sf	0.62	(gal per sf) per (acre-inch per acre)	conversion
K	Conversion from gal to AF	3.07×10^{-6}	AF per gal	conversion
L	Electricity for municipally provided water	Table W-1.1	kWh per AF	CPUC 2016
M	Conversion from kWh to MWh	0.001	MWh per kWh	conversion

ID	Variable	Value	Unit	Source
N	Carbon intensity of local electricity provider	Tables E-4.3 and E-4.4	lb CO_2e per MWh	CA Utilities 2021
O	Conversion from lb to MT	0.000454	MT per lb	conversion

Further explanation of key variables:

- (A1) – The methodology for calculating water reductions is based on the MWELO. It combines calculations for maximum allowable water use (known as MAWA per the MWELO) and estimated total water use (known as ETWU per the MWELO) into one formula for quantifying water savings.
- (D) – The evapotranspiration adjustment factor for maximum allowable water use is dependent on the project or land use type and is 0.55 for residential uses and 0.45 for non-residential uses.
- (F) – Special landscape area is an area of the landscape dedicated solely to edible plants, recreational areas, areas irrigated with recycled water, or water features using recycled water.
- (G) – In the calculation for water savings, the plant factor is the primary determinant of the magnitude of water savings. The plant factor should be taken from the University of California Davis' Water Use Classification of Landscape Species (WUCOLS) or other professional associations that are approved by DWR. The plant factor ranges from 0 to 0.1 for very low water plants; 0.1 to 0.3 for low water plants; from 0.4 to 0.6 for moderate water use plants; and from 0.7 to 1.0 for high water use plants. The water demands of a particular plant species can vary, depending on the region where the project is located. The region categorizations and plant factors can be found from the WUCOLS plant database (UC Davis 2021a, 2021b).
- (H) – The irrigation efficiency factor depends on the type of irrigation that will be used for the landscape and is 0.75 for spray head irrigation and 0.81 for drip irrigation.
- (I) – The evapotranspiration rate corresponding to the user's location affects how much water savings are achieved. Users can look-up location-dependent evapotranspiration rates from Appendix A of the MWELO (23 C.C.R. Appendix A).
- (L) – The water energy-intensity factors are derived from the most recent version of the CPUC Water Energy Calculator and are provided in Table W-1.1 in Appendix C (CPUC 2016). The energy intensity factors rely on region-wide average values for DWR's 10 hydrologic regions.
- (N) – GHG intensity factors for major utilities in California are provided in Tables E-4.3 and E-4.4 in Appendix C. If the project study area is not serviced by the listed electricity provider, or the user is able to provide a project-specific value, the user should replace these defaults in the electricity consumption GHG calculation formula.

GHG Calculation Caps or Maximums

None.

Example GHG Reduction Quantification

The user reduces GHG emissions from water-related electricity by requiring water efficient landscaping. In this example, the project is a residential use in Crescent City (North Coast hydrologic region). As a residential project, the evapotranspiration adjustment factor is 0.55 (D). Per MWELO, the evapotranspiration rate for Crescent City is 27.7 inches per year (I). The project includes a landscaped area of 1,500 sf (E), which will be landscaped with coyote mint (a low water use plant with plant factor equal to 0.1 [G]) and irrigated with a drip system (H). The project does not include special landscaping area (F). The electricity provider for the project area is PacificCorp, and the analysis year is 2022. The carbon intensity of electricity is, therefore, 1,228 lb CO_2e per MWh (N).

$$A1 = ([(\mathbf{0.55} \times \mathbf{1{,}500\ sf}) + ((1 - \mathbf{0.55}) \times \mathbf{0\ sf})] - (\frac{0.1}{0.81} \times \mathbf{1{,}500\ sf})) \times 27.7\frac{\text{inch}}{\text{yr}} \times 0.62\frac{\left(\frac{\text{gal}}{\text{sf}}\right)}{\left(\frac{\text{acre·in}}{\text{acre}}\right)} = 10{,}988\ \frac{\text{gal}}{\text{yr}}$$

$$A2 = 1 - 10{,}988\frac{\text{gal}}{\text{yr}}/[((\mathbf{0.55} \times \mathbf{1{,}500\ sf}) + ((1 - \mathbf{0.55}) \times \mathbf{0\ sf})) \times 27.7\frac{\text{inch}}{\text{yr}} \times 0.62\frac{\frac{\text{gal}}{\text{sf}}}{\frac{\text{acre·inch}}{\text{acre}}}] = 22\%$$

$$B = 10{,}988\frac{\text{gal}}{\text{yr}} \times \left(3.07{\times}10^{-6}\frac{\text{AF}}{\text{gal}}\right) \times 362\frac{\text{kWh}}{\text{AF}} = 12\frac{\text{kWh}}{\text{yr}}$$

$$C = 12\frac{\text{kWh}}{\text{yr}} \times 0.001\frac{\text{MWh}}{\text{kWh}} \times 1{,}228\ \frac{\text{lb } CO_2e}{\text{MWh}} \times 0.000454\frac{\text{MT}}{\text{lb}} = 0.007\frac{\text{MT } CO_2e}{\text{yr}}$$

Quantified Co-Benefits

Energy and Fuel Savings

Energy savings (B) are derived in the steps above that are necessary to quantify GHG reductions.

Water Conservation

Water savings (A1) are derived in the steps above that are necessary to quantify GHG reductions.

W-6. Reduce Turf in Landscapes and Lawns

GHG Mitigation Potential

Potentially large reduction in GHG emissions from outdoor water use

Co-Benefits (icon key on pg. 34)

Climate Resilience

Reducing turf conserves water resources, which will become more strained under climate change.

Health and Equity Considerations

Turf is often used for play. For residential or school projects, include play opportunities, build additional public parks nearby, and/or increase access to existing parks or playgrounds. However, turf often requires use of fertilizer (which can be derived from fossil fuels) and herbicides, both of which can affect water quality, and the removal of turf can reduce runoff effects.

Measure Description

This measure would remove or avoid turf grass. Turf grass (i.e., lawn grass) has relatively high-water needs compared to most other types of vegetation. Lowering landscaping water demands by reducing turf size would reduce water consumption and thus the corresponding energy and indirect GHG emissions that result from sourcing and transporting fresh water. Water agencies in California have instituted turf removal programs that provide rebates for residents who reduce the turf area at their homes.

Scale of Application

Project/Site

Implementation Requirements

See measure description.

Cost Considerations

Turf maintenance in landscape and lawns has always been significantly more expensive than a lawn filled with hardier species that are native to the region. As turf requires constant input to be maintained, the cost of transitioning turf to a more sustainable landscape is relatively inexpensive, and both a short- and long-term cost savings may be realized.

Expanded Mitigation Options

Additional GHG emissions savings may be achieved through reduced fertilizer use. The methods to calculate these reductions are not included in the quantification method.

GHG Reduction Formula

$A1 = D \times E \times F \times G \times H$ (Water savings)

$A2 = \frac{F}{I}$ (Percent emissions reduction)

$B = A1 \times J \times K$ (Energy savings)

$C = B \times L \times M \times N$ (Emissions reduction)

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A1	Outdoor water savings from turf reduction	[ ]	gal	calculated
A2	% reduction in GHG emissions from outdoor water use	[ ]	%	calculated
B	Energy savings from turf reduction	[ ]	kWh	calculated
C	GHG emissions reduction from turf reduction	[ ]	MT CO_2e	calculated
User Inputs				
F	Area of turf to be removed	[ ]	sf	user input
I	Total turf area	[ ]	sf	user input
Constants, Assumptions, and Available Defaults				
D	Crop coefficient	0.6 or 0.8 (cool- or warm-season grasses)	unitless	UC Davis 2021a, 2021b
E	Evapotranspiration rate	[ ]	inches per year	MWELO
G	Conversion factor acre-inches/acre to gal/sf	0.62	(gal per sf) per (acre-inch per acre)	conversion
H	Days per year	365	days per year	conversion
J	Conversion from gal to AF	3.07×10^{-6}	AF per gal	conversion
K	Electricity required for municipally provided water	Table W-1.1	kWh per AF	CPUC 2016
L	Conversion from kWh to MWh	0.001	MWh per kWh	conversion
M	Carbon intensity of local electricity provider	Tables E-4.3 and E-4.4	lb CO_2e per MWh	CA Utilities 2021
N	Conversion from lb to MT	0.000454	MT per lb	conversion

Further explanation of key variables:

- (D) – The crop coefficient for turf grasses is represented by two values, one for cool-season grasses (0.6) and one for warm-season grasses (0.8).
- (E) – The evapotranspiration rate corresponding to the user's location affects how much water savings are achieved. Users can look-up location-dependent evapotranspiration rates from Appendix A of the MWELO (23 CCR Appendix A).
- (H) – The water energy-intensity factors are derived from the most recent version of the CPUC Water Energy Calculator and are provided in Table W-1.1 in Appendix C (CPUC 2016). The energy intensity factors rely on region-wide average values for DWR's 10 hydrologic regions.
- (M) – GHG intensity factors for major utilities in California are provided in Tables E-4.3 and E-4.4 in Appendix C. If the project study area is not serviced by the listed electricity provider, or the user is able to provide a project-specific value, the user should replace these defaults in the electricity consumption GHG calculation formula.

GHG Calculation Caps or Maximums

None.

Example GHG Reduction Quantification

The user reduces GHG emissions from water-related electricity by reducing turf grass. In this example, the project is in Lancaster (South Coast hydrologic region), which has evapotranspiration rate of 44.2 inches per day (E). The project will remove 800 sf of turf (F) with warm-season grasses (D). The project's entire turf area is 1,200 sf (I). The electricity provider for the project is Lancaster Choice Energy, and the analysis year is 2022. The carbon intensity of electricity is, therefore, 600 lb CO_2e per MWh (M).

$$A1 = 0.8 \times 44.2 \frac{\text{inch}}{\text{yr}} \times 800\ \text{sf} \times 0.62 \frac{\left(\frac{\text{gal}}{\text{sf}}\right)}{\frac{\text{acre·inch}}{\text{acre}}} = 17{,}539 \frac{\text{gal}}{\text{yr}}$$

$$A2 = \frac{800\ \text{sf}}{1{,}200\ \text{sf}} = 67\%$$

$$B = 17{,}539\ \text{gal} \times \left(3.07 \times 10^{-6} \frac{\text{AF}}{\text{gal}}\right) \times 1{,}898 \frac{\text{kWh}}{\text{AF}} = 102\ \text{kWh}$$

$$C = 102\ \text{kWh} \times 0.001 \frac{\text{MWh}}{\text{kWh}} \times 600 \frac{\text{lb } CO_2e}{\text{MWh}} \times 0.000454 \frac{\text{MT}}{\text{lb}} = 0.03\ \text{MT } CO_2e$$

Quantified Co-Benefits

Energy and Fuel Savings

Energy savings (B) are derived in the steps above that are necessary to quantify GHG reductions.

Water Conservation

Water savings (A1) are derived in the steps above that are necessary to quantify GHG reductions.

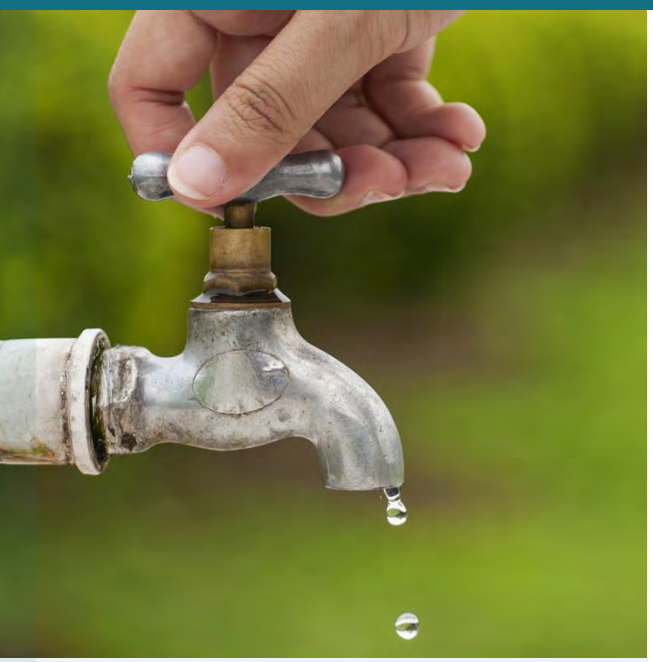
W-7. Adopt a Water Conservation Strategy



GHG Mitigation Potential

Varies

Variable reduction in GHG emissions from water use

Co-Benefits (icon key on pg. 34)

Climate Resilience

Conserving water reduces the strain on water resources, which is expected to increase under climate change.

Health and Equity Considerations

Ensure strategy includes enough water for outdoor use to maintain and enhance urban tree canopy as much as possible. Water conservation can also help to lower utility costs for project residents.

Measure Description

This measure will establish a water conservation strategy to achieve a reduction in water consumption. The water reduction performance standard is flexible to the users' needs, and in this measure is set as a percent reduction in water consumption relative to a reference condition (e.g., existing conditions, historic year).

Scale of Application

Project/Site and Plan/Community

Implementation Requirements

The strategy should clearly identify the actions that will be undertaken to achieve the performance standard. These actions could include any of the measures presented in this Handbook (Measures W-1 through W-6) or others developed by the user; for example, low-impact development practices to enhance onsite water infiltration and improve stormwater management.

Cost Considerations

A water conservation strategy is a low-cost way to encourage using less water and energy, which in turns saves money. Costs from developing and implementing the strategy are primarily related to staff time and document production. Costs and savings achieved by actions undertaken because of the strategy would vary depending on the action.

Expanded Mitigation Options

Non-applicable

GHG Reduction Formula

$$A = (B \times C) \times D \times E \times F \times G$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	GHG reduction from strategy	[ ]	MT CO_2e	calculated
User Inputs				
B	Water consumption for the reference year	[ ]	AF	user input
C	Performance standard for conservation strategy	[ ]	%	user input
Constants, Assumptions, and Available Defaults				
D	Electricity required for municipally provided water	Table W-1.1	kWh per AF	CPUC 2016
E	Conversion from kWh to MWh	0.001	MWh per kWh	conversion
F	Carbon intensity of local electricity provider	Tables E-4.3 and E-4.4	lb CO_2e per MWh	CA Utilities 2021
G	Conversion from lb to MT	0.000454	MT per lb	conversion

Further explanation of key variables:

- (B) – Water consumption for the project or community for the reference year must be defined by the user.
- (C) – The percent reduction in water consumption relative to the reference condition.
- (D) – The water energy-intensity factors are derived from the most recent version of the CPUC Water Energy Calculator and are provided in Table W-1.1 in Appendix C (CPUC 2016). The energy intensity factors rely on region-wide average values for DWR's 10 hydrologic regions.
- (F) – GHG intensity factors for major utilities in California are provided in Tables E-4.3 and E-4.4 in Appendix C. If the project study area is not serviced by the listed electricity provider, or the user is able to provide a project-specific value, the user should replace these defaults in the electricity consumption GHG calculation formula.

GHG Calculation Caps or Maximums

None.

Example GHG Reduction Quantification

The user reduces GHG emissions by adopting and implementing a water conservation strategy. In this example, the performance standard for the strategy is a 10 percent reduction in existing (2020) water consumption by 2030. Existing water consumption is 1,000 AF, and the project is in the Sacramento River hydrologic region (D) and SMUD service territory. The carbon intensity of electricity is, therefore, 224 lb CO_2e per MWh (F).

$$A = \left(1{,}000\,\frac{AF}{yr} \times 10\%\right) \times 207\,\frac{kWh}{AF} \times 0.001\,\frac{MWh}{kWh} \times 224\,\frac{lb\ CO_2e}{MWh} \times 0.000454\,\frac{MT}{lb} = 2.11\,\frac{MT\ CO_2e}{yr}$$

Quantified Co-Benefits

The co-benefits that are quantifiable (energy and fuel savings, water conservation) are calculated as part of the GHG reduction formula. The abbreviated formulas are also shown below.

Energy and Fuel Savings Formula

$$\frac{MWh}{year} = (B \times C) \times D \times E$$

Water Conservation Formula

$$\frac{AF}{year} = B \times C$$

Sources

- California Public Utilities Commission (CPUC). 2016. Water-Energy Calculator–Draft Version 1.05. https://www.cpuc.ca.gov/nexus_calculator/. Accessed: January 2021.

Lawn and Landscaping

Landscaping equipment is the primary source of direct GHG emissions in the lawn and landscaping sector. Landscaping equipment traditionally uses gasoline fuel and releases emissions based on the amount of fuel combusted and emission factor of the engine. Equipment emissions can be reduced by requiring use of zero-emission landscaping equipment (including battery-powered and corded electric equipment) over conventional gasoline-fueled counterparts. The exclusive use of grid electricity to power the equipment eliminates onsite gasoline emissions but increases indirect emissions from electricity generation. However, grid-based emissions are typically less than the emissions from the gasoline-fueled equipment (depending on the source of grid power).

Emissions reductions achieved by zero-emission equipment are determined by finding the difference in emissions between those generated by the replacement power source and those generated by conventional gasoline engines. Emissions for the mitigated scenario may consist of direct emissions from combustion fuel use, and/or indirect emissions from grid electricity. Resources and methods to quantify emissions reductions from a measure requiring zero-emission landscaping equipment are described in this section.

Additional measures that can be undertaken to reduce emissions within the lawn and landscaping sector include ensuring electric yard equipment compatibility and implementing a yard equipment exchange program. Electric yard equipment compatibility is a supporting action for successful implementation of a measure that restricts gasoline landscaping equipment in favor of zero-emission equipment. A yard equipment exchange program would help facilitate community-scale equipment turnover and engine replacement. Please refer to the *Supporting or Non-Quantified GHG Reduction Measures* section at the end of Chapter 3 for additional information.

LL-1. Replace Gas-Powered Landscape Equipment with Zero-Emission Landscape Equipment

GHG Mitigation Potential

Potentially large reduction in GHG emissions from landscaping equipment

Co-Benefits (icon key on pg. 34)

Climate Resilience

Replacing gas-powered landscape equipment with zero-emission landscape equipment can reduce sensitivity to fuel price shocks or scarcity.

Health and Equity Considerations

Consider implementing programs to help disadvantaged business enterprises convert to electric equipment. Reduction or replacement of gasoline-powered equipment reduces localized air pollution.

Measure Description

This measure requires use of zero-emission landscaping equipment over conventional gasoline-fueled counterparts. Equipment types historically powered by gasoline engines covered by this measure include chainsaws, chippers, lawn mowers, leaf blowers/vacuums, riding mowers, tillers, and trimmers (CARB 2020). Replacing gasoline-powered equipment with zero-emission equipment reduces fossil fuel combustion and thus GHG emissions. However, electric equipment results in GHG emissions from the electricity used to charge the equipment. The indirect GHG emissions increase from electricity must be calculated in addition to the GHG emissions reduction from displaced fossil fuel combustion to estimate the total net GHG emissions reduction achieved by this measure.

Scale of Application

Project/Site

Implementation Requirements

For this measure to be successfully implemented, it is helpful for electrical outlets on the exterior of buildings to be accessible so that the corded electric landscaping equipment can be more easily used in different areas, and batteries can be charged if indoor charging is not available. Measure LL-3, *Electric Yard Equipment Compatibility,* in Table 3-2 should, therefore, be considered as a supporting action to this measure.

Cost Considerations

Although the environmental benefits of replacing gas powered landscape equipment are high, so too are the costs. Zero-emission equipment is usually more expensive than conventional gasoline-powered equipment. Once the equipment is purchased, however, there are long-term cost savings in avoided fuel inputs and maintenance.

Expanded Mitigation Options

Users may consider an exchange program to expand penetration of this measure, as outlined in Measure LL-2, *Implement Yard Equipment Exchange Program*, in Table 3-2.

GHG Reduction Formula

$$A = [\mathbf{B} \times C \times (D \times E) \times F1 \times G] - [\mathbf{B} \times C \times D \times \mathbf{F2} \times H]$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	GHG reduction from using plug-in or battery electric equipment	[ ]	MT CO_2e	calculated
User Inputs				
B	Hours of equipment operation	[ ]	hours	user input
F2	Carbon intensity of gasoline equipment	[ ]	g CO_2e per hp-hour	CARB 2020
Constants, Assumptions, and Available Defaults				
C	Load factor of equipment	Table LL-1.1	unitless	CARB 2020
D	Horsepower (hp) of equipment	Table LL-1.1	hp	CARB 2020
E	Conversion from horsepower to MW	0.0007457	MW per hp	conversion
F1	Carbon intensity of local electricity provider	Tables E-4.3 and E-4.4	lb CO_2e per MWh	CA Utilities 2021
G	Conversion from lb to MT	0.000454	MT per lb	conversion
H	Conversion from grams (g) to MT	1×10^{-6}	MT per g	conversion

Further explanation of key variables:

- (C) – The load factor is the average operational level of an engine as a fraction or percentage of the engine manufacturer's maximum rated horsepower (hp). Average load factors of various landscaping equipment are provided in Table LL-1.1 in Appendix C, *Emission Factors and Data Tables* (CARB 2020). If the user can provide an equipment-specific load factor, they should replace the default in the GHG calculation formula.
- (D) – Average hp of various landscaping equipment are provided in Table LL-1.1 in Appendix C (CARB 2020). If the user can provide an equipment-specific hp, the user should replace the default in the GHG calculation formula.
- (E) – Conversion factor assumes that energy requirements and losses are the same for both a fuel-powered engine and a piece of electric equipment.
- (F1) – GHG intensity factors for major California electricity providers are provided in Tables E-4.3 and E-4.4 in Appendix C. If the project study area is not serviced by a listed electricity provider, or the user is able to provide a project-specific value (i.e., for the future year not referenced in Appendix C), the user should replace the default in the GHG calculation formula. If the electricity provider is not known, users may elect to use the statewide grid average carbon intensity.
- (F2) – GHG intensity factors for various landscaping equipment can be obtained from CARB's (2020) SORE2020 model.

GHG Calculation Caps or Maximums

None.

Example GHG Reduction Quantification

The user reduces lawn and landscaping emissions by replacing fossil fuel combustion with electricity consumption, which generates fewer GHG emissions per unit of activity. In this example, a 5-hp residential gasoline 4-stroke leaf blower (D) that is used 8 hours per day (B) is replaced by an electric-powered equivalent. The average load factor for a 5-hp leaf blower is 0.94 (C). The electricity provider for the project area is CleanPower SF and the analysis year is 2025. The carbon intensity of electricity is, therefore, 80 lb CO_2e per MWh (F1).

$$A = \left(8\ \frac{\text{hours}}{\text{day}} \times 0.94 \times \left[5\ \text{hp} \times 0.0007457\ \frac{\text{MW}}{\text{hp}}\right] \times 80\ \frac{\text{lb } CO_2e}{\text{MWh}} \times 0.000454 \frac{\text{MT}}{\text{lb}}\right) - \left(8\ \frac{\text{hours}}{\text{day}} \times 0.94 \times 5\ \text{hp} \times 635 \frac{\text{g } CO_2e}{\text{hp-hour}} \times 1e^{-6} \frac{\text{MT}}{\text{g}}\right) = -0.02 \frac{\text{MT } CO_2e}{\text{day}}$$

Measure Co-Benefits

Improved Air Quality

Reducing gasoline combustion will also reduce local criteria pollutants. Emission savings can be calculated using the same formula used to quantify GHG reductions (A). Criteria pollutant intensity factors for various landscaping equipment can be obtained from CARB's (2020) SORE2020 model.

Electricity supplied by statewide fossil-fueled or bioenergy power plants will generate criteria pollutants. However, because these power plants are located throughout the state, electricity consumption from equipment charging will not generate localized criteria pollutant emissions. Consequently, for the quantification of criteria pollutant emission reductions, either the electricity portion of the equation can be removed, or the electricity intensity (F1) can be set to zero.

Energy and Fuel Savings

Fossil fuel (gasoline) savings are a product of the equipment fuel efficiency (gal consumed per hour) and the equipment operating time (hours). Fuel intensity factors for various landscaping equipment can be obtained from CARB's (2020) SORE2020 model . Users should multiply the fuel intensity by the equipment operating hours to quantify fuel savings. Increased electricity consumption is calculated as part of the GHG reduction formula. The abbreviated formula is also shown below.

$$\text{MWh} = [\text{B} \times \text{C} \times (\text{D} \times \text{E})]$$

Solid Waste

CH_4 emissions are generated through the decomposition of organic waste disposed in a landfill. CO_2 is also generated as materials degrade, but these emissions are considered part of the natural carbon cycle of growth and decomposition. The transportation of waste to a landfilling facility also generates emissions from the combustion of fuel to operate the waste-hauling vehicle. In some cases, organic materials that are landfilled do not completely decompose, allowing for biogenic carbon storage that otherwise would not have occurred. In addition, landfills may capture some of the CH_4 generated by organic materials and combust it to generate electricity, thereby avoiding emissions that otherwise would have been emitted to generate electricity (U.S. EPA 2020).

Emissions associated with landfilling can be avoided through the diversion of waste. Alternate waste management pathways include recycling and composting.

- Recycling is the separation and collection of wastes, their subsequent transformation or remanufacture into usable or marketable products or materials, and the purchase of products made from recyclable materials (U.S. EPA 2020). During recycling, emissions are generated from the transportation of waste to recycling facilities and the operation of machinery to process these materials into new, recycled products. Other emissions may be generated during the recycling process through the purification chemicals or agents. At the same time, recycling offsets emissions associated with the virgin production of materials.
- Composting involves bacterial decomposition of organic matter into compost. Emissions result from the transportation and processing of waste at the compost facility, as well as from the decomposition process. At the same time, compost application can help reduce the use of synthetic fertilizers and increase soil carbon storage.

The methodology used in this Handbook to quantify emission reductions from diverting waste from landfills is based on a lifecycle approach that accounts for upstream and downstream emissions associated with the waste management pathways with and without the measure. This is consistent with the methodology developed by the U.S. Environmental Protection Agency (U.S. EPA) (2020). As a result, users are cautioned in how these reductions are compared to operational emissions inventories, which may not include lifecycle emissions. Additionally, the methodology assumes that all disposed waste will be diverted from the landfill. In reality, recycling and composting programs will likely only result in the diversion of a fraction of disposed waste. Users should consider this when calculating the benefits of implementation of waste diversion programs.

Use the graphic to click on an individual measure to navigate directly to the measure's factsheet.

S-1. Institute or Extend Recycling Services

GHG Mitigation Potential

Potentially small reduction in GHG emissions from waste management pathways

Co-Benefits (icon key on pg. 34)

Climate Resilience

Recycling can reduce upstream material extraction and product manufacturing, preserving resources and reducing energy use.

Health and Equity Considerations

Any new recycling facilities should not be constructed near vulnerable or underserved communities.

Measure Description

This measure will institute or extend recycling services to reduce the volume of landfilled waste. Decomposition of certain types of landfilled waste produces CH_4. Increasing waste diversion from landfills therefore reduces GHG emissions. The recycling process generates some emissions, but also reduces upstream emissions from the manufacturing and production of new raw materials and goods.

Scale of Application

Project/Site and Plan/Community

Implementation Requirements

See measure description.

Cost Considerations

Expanding recycling services generates costs of collection, processing, and management of the materials to be recycled, and can include the construction of new facilities to process a certain type of material, or transportation for the materials to reach a plant that can accommodate them. However, expanded recycling also reduces costs associated with new material production, waste processing, landfill management, pollution control, and waste-stream GHG emissions.

Expanded Mitigation Options

Waste reduction is as important, if not more so, as waste diversion. Work with building tenants to audit waste streams to identify opportunities for material reduction. For example, organizations may reduce single-use disposal at large events (e.g., concerts) and venues (e.g., stadiums) through partnerships with organizations that provide reusable cups and dishes.

GHG Reduction Formula

$A = [E1 \text{ or } E2] \times D$

$B_Z = A \times F_Z$

$C = \text{Input } B_Z \text{ into U.S. EPA WARM}$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Waste disposed by building type	[ ]	tons	calculated
B	Waste disposed by material type	[ ]	tons	calculated
C	GHG reduction from recycling vs. landfilling waste	[ ]	MT CO_2e	calculated using U.S. EPA WARM
User Inputs				
D	Population	[ ]	resident or employee	user input
Constants, Assumptions, and Available Defaults				
E1	Annual residential waste disposal rates by location	Table S-1.1	tons per resident per year	CalRecycle n.d.(a)
E2	Annual statewide non-residential waste disposal rates by business type	Table S-1.2	tons per employee per year	CalRecycle n.d.(b)
F	Percentage of material z in waste stream	Table S-1.3	%	CalRecycle n.d.(c), 2020
z	Material type (e.g., glass)	N/A	-	-

Further explanation of key variables:

- (C) – U.S. EPA's (2020) Waste Reduction Model (WARM) calculates GHG emissions associated with various waste management practices, including recycling and landfilling. To estimate the GHG benefit of recycling over landfilling, users input the tonnage of waste by material type into the Tons Landfilled column under the "baseline" scenario. The user then inputs the tonnage of waste by material type into the Tons Recycled column under the "alternative management" scenario. If a material type cannot be recycled, the used should input the tonnage for that material into the Tons Landfilled column under the alternative management scenario. The model calculates emissions under the baseline and alternative management scenarios of manufacturing, transportation, and end-of-life landfilling or recycling of waste and shows the net GHG savings in MT CO_2e.
- (E1) – Annual solid waste disposal rates for multi-family and single-family homes are provided in Table S-1.1 in Appendix C, *Emission Factors and Data Tables*.
- (E2) – Annual non-residential waste disposal rates by business type are provided in Table S-1.2 in Appendix C.

- (F) – The composition of disposed waste by material type for residential and non-residential buildings is provided in Table S-1.3 in Appendix C.

GHG Calculation Caps or Maximums

None.

Example GHG Reduction Quantification

The user reduces GHG emissions by diverting waste from a landfill to a recycling center. In this example, the project is an Arts, Entertainment, & Recreation business with 100 employees (D).

$$A = 1.94 \frac{\text{tons}}{\text{yr·employee}} \times 100 \text{ employees} = 194 \frac{\text{tons}}{\text{yr}}$$

$$B_{paper} = 194 \frac{\text{tons}}{\text{yr}} \times 21\% = 40.7 \frac{\text{tons}}{\text{yr}}$$

$$B_{glass} = 194 \frac{\text{tons}}{\text{yr}} \times 3\% = 5.8 \frac{\text{tons}}{\text{yr}}$$

$$B_{metals} = 194 \frac{\text{tons}}{\text{yr}} \times 2\% = 3.9 \frac{\text{tons}}{\text{yr}}$$

$$B_{plastic} = 194 \frac{\text{tons}}{\text{yr}} \times 14\% = 27.2 \frac{\text{tons}}{\text{yr}}$$

$$B_{food} = 194 \frac{\text{tons}}{\text{yr}} \times 34\% = 66.0 \frac{\text{tons}}{\text{yr}}$$

$$B_{yard\ trimmings} = 194 \frac{\text{tons}}{\text{yr}} \times 12\% = 23.3 \frac{\text{tons}}{\text{yr}}$$

$$B_{mixed\ organics} = 194 \frac{\text{tons}}{\text{yr}} \times 6\% = 11.6 \frac{\text{tons}}{\text{yr}}$$

$$B_{carpet} = 194 \frac{\text{tons}}{\text{yr}} \times 1\% = 1.9 \frac{\text{tons}}{\text{yr}}$$

$$B_{concrete} = 194 \frac{\text{tons}}{\text{yr}} \times 2\% = 3.9 \frac{\text{tons}}{\text{yr}}$$

$$B_{dimensonal\ lumber} = 194 \frac{\text{tons}}{\text{yr}} \times 1\% = 1.9 \frac{\text{tons}}{\text{yr}}$$

$$B_{fly\ ash} = 194 \frac{\text{tons}}{\text{yr}} \times 1\% = 1.9 \frac{\text{tons}}{\text{yr}}$$

The user inputs the tons of waste by material type (B) into U.S. EPA's WARM in the Tons Landfilled column. The project will recycle all paper (B_{paper}), glass (B_{glass}), and plastic ($B_{plastic}$),

which is assumed in the alternative management scenario. Based on WARM, the project would mitigate up to 202 MT CO_2e by diverting its waste from a landfill to a recycling facility.

Quantified Co-Benefits

None.

S-2. Implement Organics Diversion Program

GHG Mitigation Potential

Potentially small reduction in GHG emissions from management pathways

Co-Benefits (icon key on pg. 34)

Climate Resilience

Organics diversion programs can increase the amount of compost produced, which can go toward gardens and farms and help improve food and crop production. Compost can also help increase soil carbon storage, which can in turn improve biodiversity and groundwater storage.

Health and Equity Considerations

If possible, work with local food banks and shelters to ensure that edible food goes to people first.

Measure Description

This measure will implement an organics diversion program to reduce the volume of organic waste sent to landfills. An organics diversion program lowers the landfill disposal rate of food waste (both edible and non-edible), food soiled paper, yard waste, and non-hazardous wood waste. Decomposition of organic waste in landfills produces CH_4. Increasing organic waste diversion from landfills thus reduces GHG emissions.

Scale of Application

Project/Site and Plan/Community

Implementation Requirements

Waste management practices to support organics diversion may include construction and management of a composting facility (citywide scale), providing residential and business composting pickup services (citywide scale), community outreach (citywide scale and project scale), or providing clearly marked triple bin locations (waste, recycling, composting) (project scale).

Cost Considerations

Implementing organics diversion services, or utility scale composting, generates costs for collection, processing, and management of the materials to be composted, and can include the construction of new composting facilities or transportation for the materials to reach a plant that can accommodate them. However, expanded composting also reduces costs associated with waste processing, landfill management, pollution control, and waste-stream greenhouse gas emissions. The resulting compost can also take the place of fertilizer, saving costs on land management inputs and increasing agricultural yields.

Expanded Mitigation Options

Diversion of edible food to food banks is another viable organics diversion program but is not specifically captured by the current quantitative method for this measure.

GHG Reduction Formula

$A = [E1 \text{ or } E2] \times D$

$B_Z = A \times F_Z$

$C = \text{Input } B_Z \text{ into U.S. EPA WARM}$

Composting can help reduce the use of nitrogen-based fertilizer, which results in GHG emissions during the manufacturing process (which involves use of natural gas) and release of nitrogen dioxide (NO_2) during use. These emissions are not quantified as part of this measure's methodology. Additional GHG reductions may be achieved if the diversion program reduces VMT and associated vehicle emissions. Refer to *Quantified Co-Benefits* below for further discussion.

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Waste disposed by building type	[ ]	tons	calculated
B	Waste disposed by material type	[ ]	Tons	calculated
C	GHG reduction from recycling vs. composting waste	[ ]	MT CO_2e	calculated using U.S. EPA WARM
User Inputs				
D	Population	[ ]	resident or employee	user input
Constants, Assumptions, and Available Defaults				
E1	Annual residential waste disposal rates by location	Table S-1.1	tons per resident per year	CalRecycle n.d.(a)
E2	Annual statewide non-residential waste disposal rates by business type	Table S-1.2	tons per employee per year	CalRecycle n.d.(b)
F	Percentage of material z in waste stream	Table S-1.3	%	CalRecycle n.d.(c), 2020
z	Material type (e.g., glass)	N/A	-	-

Further explanation of key variables:

- (C) – U.S. EPA's (2020) WARM calculates the GHG emission impacts associated with various waste management practices, including recycling and composting. To estimate the GHG benefit of composting over landfilling, users input the tonnage of organic waste by material type into the Tons Landfilled column under the "baseline" scenario. The user then inputs the tonnage of organic waste by material type into the Tons Composted column under the "alternative management" scenario. The model calculates emissions under the baseline and alternative management scenarios of manufacturing, transportation and end-of-life landfilling, or diversion of organic waste and shows the net GHG savings in MT CO_2e.

- (E1) – Annual solid waste disposal rates for multi-family and single-family homes are provided in Table S-1.1 in Appendix C.
- (E2) – Annual non-residential waste disposal rates by business type are provided in Table S-1.2 in Appendix C.
- (F) – The composition of disposed waste by material type for residential and non-residential buildings is provided in Table S-1.3 in Appendix C.

GHG Calculation Caps or Maximums

None.

Example GHG Reduction Quantification

The user reduces GHG emissions by diverting organic waste from a landfill. In this example, the project is an Arts, Entertainment, & Recreation business with 100 employees (D).

$$A = 1.94 \frac{\text{tons}}{\text{yr·employee}} \times 100 \text{ employees} = 194 \frac{\text{tons}}{\text{yr}}$$

$$B_{food} = 194 \frac{\text{tons}}{\text{yr}} \times 34\% = 66.0 \frac{\text{tons}}{\text{yr}}$$

$$B_{yard\ trimmings} = 194 \frac{\text{tons}}{\text{yr}} \times 12\% = 23.3 \frac{\text{tons}}{\text{yr}}$$

$$B_{mixed\ organics} = 194 \frac{\text{tons}}{\text{yr}} \times 6\% = 11.6 \frac{\text{tons}}{\text{yr}}$$

The user inputs the tons of waste by material type (B) into U.S. EPA's WARM in the Tons Landfilled column. The project will compost all materials, which is assumed in the alternative management scenario. Based on WARM, this business can mitigate up to 40 MT CO_2e by diverting waste from a landfill to compost facility.

Quantified Co-Benefits

VMT Reductions

Organics diversion programs may reduce waste transfer vehicle VMT if the compost facility is closer to the waste generation source than the landfill. The VMT reduction may be calculated using the following formula.

$$G = (H \times I) - (J \times K)$$

VMT Reduction Calculation Variables

ID	Variable	Value	Unit	Source
Output				
G	Reduction in waste transfer vehicle VMT	[ ]	miles/day	calculated
User Inputs				
H	Daily waste transfer trips without the organics diversion program	[ ]	trips/day	user input
I	Waste transfer trip distance without the organics diversion program	[ ]	miles/trip	user input
J	Daily waste transfer trips under the organics diversion program	[ ]	trips/day	user input
K	Waste transfer trip distance under the organics diversion program	[ ]	miles/trip	user input
Constants, Assumptions, and Available Defaults				
	None			

Further explanation of key variables:

- (H, J) – The user should take care to properly account for all vehicle trips directly affected by implementation of the measure. This value may be the same with and without the diversion program.
- (I, K) – The user should take care to properly account for the full trip distance of the waste transfer vehicle. Note that if the trip distance increases with implementation of the organics diversion program (i.e., K>I), this measure would result in a VMT increase.

Users may translate VMT reductions (or increases) (G) to GHG emissions using emission factors from CARB's (2021) EMFAC model. Users should multiply the VMT reductions (or increases) by the appropriate vehicle emission factors. If the organics diversion program also reduces (or increases) the number of vehicle trips (i.e., J<H or J>H), users should quantify the resulting changes in process emissions using EMFAC.

Improved Air Quality

Composting can produce volatile organic compound (VOC) emissions in and around the composting site. This may result in worsened regional air quality. Increases in VOC emissions may be offset if the organics diversion program reduces waste transfer vehicle VMT. Users may translate VMT reductions (or increases) (G) to criteria pollutant emissions using emission factors from CARB's (2021) EMFAC model. Users should multiply the VMT reductions (or increases) by the appropriate vehicle emission factors. If the organics diversion program also reduces (or increases) the number of vehicle trips (i.e., J<H or J>H), users should quantify the resulting changes in process emissions using EMFAC.

Natural and Working Lands

Natural and working lands may be a GHG sink or source of GHG emissions. For example, trees and other vegetation incorporate carbon into their biomass during their growth phase and thereby can remove a finite amount of carbon from the atmosphere. Carbon can also be stored in soils. These types of natural lands are considered GHG sinks. Other types of lands, on the other hand, such as certain types of agriculture and animal operations, can emit GHGs from a variety of sources and activities.

Measures within the natural and working lands sector aim to either enhance the sequestration capacity of the land or reduce the intensity of emissions from GHG sources. A project can increase the area available for vegetation by converting previously developed land into vegetated open space. Conversions from one type of vegetated land to another may increase or decrease carbon sequestration, depending on the relative sequestration capacities of the land types. Additional ways to increase sequestration may include planting new trees on either developed or undeveloped land. GHG emission from working lands can be reduced through climate-smart farming practices, some of which may increase below- and above-ground carbon storage.

Methods to quantify GHG reductions from natural and working lands measures are inherently complex given the dynamic variables that influence GHG emissions. These methods do not lend to a simplified quantification approach that can be presented in a few pages. Therefore, it is advised users rely on existing tools to quantify GHG reductions as referenced in this section. Additional measures that can be undertaken to reduce emissions within the natural and working lands sector include establishing a local farmer's market or community garden. Please refer to *Supporting or Non-Quantified GHG Reduction Measures* for additional information on these measures.

Use the below graphic to click on an individual measure to navigate directly to the measure's factsheet.

Natural and Working Lands

- N-1. Create New Vegetated Open Space
- N-2. Expand Urban Tree Planting
- N-3. Implement Management Practices to Improve the Health and Function of Natural and Working Lands
- N-4. Require Best Management Practices for Manure Management

N-1. Create New Vegetated Open Space

Photo Credit: Doug Donaldson, March 2017

GHG Mitigation Potential

Varies

Variable reduction in GHG emissions from vegetated open spaces

Co-Benefits (icon key on pg. 34)

Climate Resilience

Creating new vegetated open spaces can reduce the urban heat island effect, mitigate flooding, and improve water quality, as well as provide recreational spaces that improve health and community resilience. Vegetated open space can also provide wildlife habitat and corridors for wildlife migration in the face of increasing temperatures and changing precipitation patterns.

Health and Equity Considerations

Prioritize open space creation in communities that have the lowest level of access to parks, gardens, and open spaces.

Measure Description

This measure would convert previously developed areas to vegetated open spaces. By creating new vegetated areas from previously settled land, the project would sequester CO_2 that would not have been captured without the land conversion. Trees and other vegetation also incorporate carbon into their biomass during their growth phase (stored carbon).

Scale of Application

Project/Site and Plan/Community

Implementation Requirements

Implementation must involve conversion of cleared areas to vegetated open spaces. This measure does not give any GHG reduction for the preservation of existing lands.

Cost Considerations

Upfront costs of creating more green spaces will depend on how the land is currently being used and how much construction is required to make it suitable. However, vegetated open spaces can achieve cost savings from improved storm water management, and can also reduce the incidence and cost of heat exposure and pollution-related illnesses.

Expanded Mitigation Options

A best practice for creating new open spaces is to ensure the habitat type(s) are native or will thrive in the local climate.

GHG Reduction Formula

RePlan

Users are directed to the California Strategic Growth Council's (2021) *RePlan: Regional Conservation and Development Planning Tool* (RePlan). RePlan provides an estimate of total stored carbon throughout California. The tool was developed using CARB's Natural and Working Lands (NWL) inventory method. Users can identify total stored carbon across five geographic scales: statewide, ecoregion, county, watershed, and user-drawn polygon for a specific area. Based on the scale selected, RePlan returns the metric tons (equivalent to megagrams, as used by RePlan) of stored carbon per hectare (ha). The carbon storage value is representative of current conditions, per CARB's inventory and the analysis conducted by the Strategic Growth Council. The result is not an annual accumulation value or sequestration rate.

Users converting previously developed areas to vegetated open spaces can use RePlan to obtain estimated total ecosystem carbon storage on parcels within the same general area of the project that contain similar land cover types. RePlan can also be used to estimate existing stored carbon (if any) on the project site that will be converted to the new land cover type. Existing stored carbon on the project site should be subtracted from the estimated carbon storage of the future land use type.

Alternative Quantification Method

RePlan integrates the latest planning and environmental data to support robust quantification of carbon storage throughout the state. The tool is aligned with California's conservation, resource management, and development objectives. While RePlan is recommended as the primary quantification tool for this measure, users may consult the below equation and method to generate a high-level estimate of stored soil carbon plus above and belowground biomass carbon pools, which can serve as an estimate of total CO_2 stored.

$$A = [(B_C \times C_C) + (B_S \times C_S \times D)] \times E$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	CO_2 benefit from new land cover type (soil and above and belowground carbon storage)	[ ]	MT CO_2e per year (over accumulation period)	calculated
User Inputs				
B_C	Hectare (Ha) of land-by-land cover type	[ ]	ha	user input
B_S	Ha of land by soil type	[ ]	ha	user input
Constants, Assumptions, and Available Defaults				
C_C	Annual above and belowground biomass carbon accumulation by land cover type	Table N-1.1	MT carbon per ha per year	CARB 2021a
C_S	Annual soil carbon accumulation by soil type and land use type	Table N-1.2	MT carbon per ha per year	CARB 2020a

ID	Variable	Value	Unit	Source
D	Soil carbon gain from conversion from settlements to vegetated land	30	%	CARB 2020a
E	Molecular weight ratio of CO_2 to carbon	44/12	MT CO_2 to MT carbon	assumed

Further explanation of key variables:

- (A) – If the existing land use type currently generates CO_2e or includes soil carbon plus above or belowground stored carbon, those emissions should be added or removed, respectively, from the CO_2e reduction quantified under this measure.
- (B_C) – The land cover types are based on those defined in CARB's NWL inventory.
- (B_S) – The soil types and land use types are based on those defined in CARB's *Benefits Calculator Tool for Agricultural Lands Conservation* (CARB 2020a). The soil type for the project area can be obtained from UC Davis' SoilWeb (UC Davis n.d.). CARB's *Agricultural Lands Conservation Easement Quantification Methodology* provides detailed instructions for using this tool (CARB 2020b).
- (C_C) – Average annual above or belowground stored carbon accumulation rates per ha of land cover type and air basin are provided in Table N-1.1 in Appendix C, *Emissions Factors and Data Tables*. These rates include above and belowground carbon storage in biomass pools. They were developed by CARB (2021a) from their NWL inventory. The rates have been annualized over the following accumulation periods.
  - Forest = 60 years. This is the median project duration under the California Climate Investments Forest Health Quantification Method for the California Department of Forestry and Fire Protection's Forest Health Program. The median project duration represents one stand rotation, which is the typical time to harvest (CARB 2021b).
  - Grasslands = 20 years. This represents the typical amount of time for restored grasslands on former agricultural sites to accumulate the same amount of biomass carbon as native grasslands (Matamala et al. 2008).
  - Shrublands = 35 years. This rate represents the average frequency of wildfires in Southern California Chaparral systems (Luo et al. 2007).
- (C_S) – Average annual soil carbon accumulation rates per ha of land use type are provided in Table N-1.2 in Appendix C (CARB 2020a). The rates have been annualized over a 20-year accumulation period, consistent with IPCC's (2006) GHG inventory framework.

GHG Calculation Caps or Maximums

None. If the existing land use cover currently includes stored carbon, and that value exceeds that of the new land cover type, this measure may result in a GHG emissions increase.

Example GHG Reduction Quantification

The user reduces GHG emissions by converting 20 ha of developed area to Broadleaf Forest (B_C) with a Spodosols (B_S) soil type. The project is in the Lake Tahoe Air Basin where the resulting annual average above and belowground biomass carbon accumulation per ha is 1.69 MT (C_C). The annual average carbon stock per ha is 5.89 MT (C_S). The resulting CO_2e reduction is 254 MT per year.

$$A = \left[\left(20\ \text{ha} \times 1.69\ \frac{\text{MT carbon}}{\text{ha·yr}}\right) + \left(20\ \text{ha} \times 5.89\ \frac{\text{MT carbon}}{\text{ha·yr}} \times 30\%\right)\right] \times \frac{44}{12}\frac{\text{MT } CO_2}{\text{MT carbon}} = 254\ \frac{\text{MT } CO_2e}{\text{yr}}$$

Quantified Co-Benefits

None quantified. Depending on the land cover type created, successful implementation of this measure could achieve improved air quality, improved public health, and improved ecosystem health.

N-2. Expand Urban Tree Planting

GHG Mitigation Potential

Varies

Variable reduction in GHG emissions from urban tree planting

Co-Benefits (icon key on pg. 34)

Climate Resilience

Planting trees provides more shade, reducing the urban heat island effect and localized health impacts of higher temperatures. Trees can also help to improve stormwater management and air quality and support mental health and social resilience.

Health and Equity Considerations

Tree planting should be prioritized in areas that have lower levels of existing canopy. Tree-planting programs should be designed in collaboration with residents. This ensures not only that community preferences are considered, but that the community feels ownership over the trees and is more likely to participate in long-term tree care. Trees should be selected according to local preferences, such as avoiding high-pollen trees that may exacerbate allergies.

Measure Description

This measure requires tree planting in urban areas. Planting trees sequesters CO_2 while the trees are actively growing, thereby reducing GHGs. The amount of CO_2 sequestered depends on the type of tree and the duration of the active growing period. Urban trees may also provide shade, which can reduce the urban heat island effect and building cooling demands. Buildings that use less electricity for air conditioning reduce energy consumption and associated indirect GHG emission.

Given many parts of California are in dry climates, the selection of tree type is critical to minimize the use of additional water. Trees that have high water demands that are met through GHG-intensive water (such as water transported over long distances) can impact the amount of GHG reductions achieved by this measure. Nonetheless, even during times of drought, trees help to provide multiple benefits to communities, and state agencies as well as natural resource organizations have emphasized repeatedly the importance of watering and maintaining trees during droughts.

Scale of Application

Project/Site and Plan/Community

Implementation Requirements

See measure description.

Cost Considerations

Upfront costs of planting more urban trees will depend on how the land is currently being used and how much maintenance and assistance in growing the trees will need to be successful. However, urban trees can reduce the incidence and cost of heat exposure and pollution-related illnesses by reducing the urban heat island effect and filtering pollutants from the air and soil.

Expanded Mitigation Options

Best practices for urban tree planting programs include selecting native tree species that require minimal water and maintenance, planting low-biogenic VOC emitting and low-allergen trees, and appropriately distancing trees from buildings, especially in high fire areas.

GHG Reduction Formula

Users are directed to the U.S. Forest Service (USFS) (2021) i-Tree Planting tool. The i-Tree Planting tool quantifies increased carbon sequestration from urban tree planting using species-based biomass equations that account for user defined site-specific variables and tree growth rates. The tool also quantifies GHG reductions from energy savings (e.g., kWh), if applicable.

While simplified quantification methods for increased carbon sequestration resulting from urban tree planting have been used in the past, this Handbook does not recommend their application given the number and dynamic nature of variables that can influence the amount of CO_2 reduced. Tools like i-Tree Planting comprehensively account for these variables, enabling users easily to calculate the approximate benefits from individual trees.

The i-Tree Planting tool is available at: https://planting.itreetools.org/.

Depending on the scale of the project, users may also wish to consult other i-Tree tools, including i-Tree Design (https://design.itreetools.org/), i-Tree Canopy (https://canopy.itreetools.org/), and i-Tree County (https://county.itreetools.org/). Users may consult the Climate Action Reserves' *Urban Tree Planting Project Protocol* (CAR 2014) or CARB's *Quantification Methodology for Urban and Community Forestry Program* (CARB 2020).

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	CO_2 sequestered over project lifetime	[ ]	lb CO_2	calculated
B	CO_2 reduced from building energy savings over project lifetime	[ ]	lb CO_2	calculated
User Inputs				
C	Project state/province	[ ]	address	user input
D	Project county/division	[ ]	Text	user input
E	Project city	[ ]	Text	user input
F	Project lifetime	1–99	Years	user input
G	Tree mortality over project lifetime	0–100	%	user input
H	Tree species planted by the project	[ ]	species name	user input*
I	Diameter breast height of each tree	[ ]	Inches	user input*
J	Distance to the nearest building	[ ]	Feet	user input*
K	Direction of tree from the building	[ ]	degrees	user input*
L	Building vintage	[ ]	Text	user input*
M	Building climate controls	[ ]	Text	user input*
N	Tree condition	[ ]	Text	user input*
O	Tree exposure to sunlight	[ ]	Text	user input*
Constants, Assumptions, and Available Defaults				
Q	Carbon intensity of local electricity provider	Table E-4.3 Table E-4.4	lb CO_2e per MWh	CA Utilities 2021
R	Carbon intensity of natural gas	117	lb CO_2e per MMBtu	TCR 2020

* Inputs provided through a drop-down menu.

Further explanation of key variables:

- (A and B) – The GHG reductions are presented over the project lifetime. If users are seeking an annualized value, they will need to divide this result by the assumed project lifetime (F).
- (F) – Trees sequester CO_2 while the trees are actively growing. The i-Tree Planting tool will project the benefits for up to 99 years into the future. The tool defaults to 40 years.
- (G) – The i-Tree Planting tool will incorporate tree mortality into the projected benefits.
- (I) – The diameter of the trunk measured at 4.5 feet above the ground.
- (J) – For trees that will be planted to shade buildings, enter the distance class to the nearest building (0–19 feet, 20–39 feet, 40–59 feet, > 60 feet). Note that this could be a building on an adjacent site. The i-Tree tool will not calculate shade benefits (i.e., energy savings) for trees more than 60 feet away from the building.
- (K) – General direction of the tree from the building (e.g., north 0 degrees). This input can be ignored if the tree is more than 60 feet from the building.
- (L) – The age of the building affects its energy efficiency and therefore the potential benefits the trees can bring. Available inputs are built after 1980, built 1950–1980, and built before 1950. If the specific age of the building in unknown, the user can input the typical age of buildings for the area where the user is working. This input can be ignored if the tree is more than 60 feet from the building.
- (M) – Trees can only have an impact on energy use in buildings where energy is used to heat or cool. Available inputs are heating and air conditioning (A/C), heat only, A/C only, and none. If the climate controls of the building are unknown, the user can input the option that is most common for the area where the user is working. This input can be ignored if the tree is more than 60 feet from the building.
- (N) – The condition of the trees will affect how well they grow and thus future benefits. Available inputs are excellent, good, fair, poor, critical, dying, and dead. New plantings are likely to be excellent.
- (O) – The exposure to sunlight affects both how the trees grow and the degree to which a new tree adds shade to a building. Available inputs are full sun, partial shade, and full shade.
- (Q) – GHG intensity factors for major California utilities are provided in Tables E-4.3 and E-4.4 in Appendix C. If the project study area is not serviced by a listed electricity provider, or the user is able to provide a project-specific value (i.e., for a future year not referenced in Tables E-4.3 or E-4.4), the user should use that specific value. If the electricity provider is not known, the user may elect to use the statewide grid average carbon intensity or rely on the i-Tree Planting default.
- (R) – The carbon intensity of natural gas was calculated in terms of CO_2e by multiplying the U.S. natural gas combustion emission factors for CO_2, CH_4, and N_2O (TCR 2020) by the corresponding 100-year GWP values from the IPCC's Fourth Assessment Report (IPCC 2007). See Table E-4.5 in Appendix C for more natural gas emission factors.

GHG Calculation Caps or Maximums

None.

Example GHG Reduction Quantification

The user reduces emissions by planting shade trees at a new home site. In this example, the project is in the City of Sacramento (E)/Sacramento County (D)/California (C). The electricity provider for the project area is SMUD, and the analysis year is 2022. The carbon intensity of electricity is, therefore, 344 lb CO_2e per megawatt-hour (Q). The project lifetime is 40 years (F) and expected tree morality 10 percent (G). The project will plant two (P) live oaks (H) with a diameter breast height of 4 inches (I). The trees are 0 to 19 feet from the nearest building (J) and oriented east 90 degrees (K). The building was built between 1950 and 1980 (L) and includes heat and A/C (M). The tree condition is excellent (N) and has full sunlight (O). Based on these inputs to the i-Tree Planting tool, over the project lifetime, the trees would sequester 16,045 lb of CO_2 and reduce 6,787 lb of CO_2 from building energy savings. This totals 22,832 pounds of CO_2, or 571 pounds CO_2 per year (based on 40-year project lifetime).

Quantified Co-Benefits

The i-Tree tool outputs electricity savings (kWh), fuel savings (MMBtu), avoided runoff (gallons), and criteria pollutant emissions reductions (pounds). All values are over the project lifetime. Note that depending on user inputs, the measure may result in increased fuel consumption (MMBtu) from building shading in the winter.

N-3. Implement Management Practices to Improve the Health and Function of Natural and Working Lands

GHG Mitigation Potential

Varies

Variable reduction in GHG emissions from natural and working lands

Co-Benefits (icon key on pg. 34)

Climate Resilience

Improving the health and function of natural and working islands can reduce the urban heat island effect and flooding and improve water quality, as well as provide recreational spaces that improve health and community resilience. Improving natural and working lands can also provide habitat in which wildlife can live and through which it can migrate in the face of increasing temperatures and changing precipitation patterns.

Health and Equity Considerations

Some management practices can reduce the use of pesticides and herbicides, which can reduce exposure to farmworkers and their families.

Measure Description

This measure covers a broad range of management strategies aimed at improving the overall health and functionality of natural and working lands as a mechanism for increasing carbon sequestration and reducing GHG emissions. Management practices may include those that change ecosystem carbon exchange rates (e.g., cultivated land soil conservation, use of biochar) and those that involve land cover changes.

Scale of Application

Plan/Community

Implementation Requirements

Note that this measure is only applicable to users with land management authority.

Cost Considerations

Overall, improved land management reduces net expenses drastically. Practices designed for maximum land health reduce costs related to inputs, irrigation, and damage from extreme weather, and preserve ecosystems and animal life.

Expanded Mitigation Options

See the *GHG Reduction Formula* section below for online tools to quantify GHG reductions from various conservation practices and management strategies. For agricultural applications, consider developing a Carbon Farm Plan to comprehensively evaluate all elements of your land management strategy.

GHG Reduction Formula

Users are directed to the U.S. Department of Agriculture (2021) COMET-Planner Tool (COMET-Planner) and USFS (2021) Forest Vegetation Simulator (FVS). COMET-Planner is a California-specific tool that was developed for the California Department of Food and Agriculture Heathy Soils Program. COMET-Planner should be used to quantify GHG reductions from conservation practices on cropland, orchard and vineyards, and grazing land. The FVS should be used to quantify GHG reductions from forest management.

GHG Calculation Caps or Maximums

None.

Example GHG Reduction Quantification

The user reduces emissions by implementing grazing management to improve irrigated pasture conditions. The user consults COMET-Planner to quantify the estimated reductions. The project is in Napa County. The user selects "Grazing" for the agricultural system, "Prescribed Grazing" for the conservation practice standard, and "Grazing Management to Improve Irrigated Pasture Condition" for the conservation practice implementation. The practice would be applied to 25 acres. Based on these inputs, the user will reduce GHG emissions by 2 MT CO_2e per year (USDA 2021).

Quantified Co-Benefits

None quantified. Depending on the management strategy, successful implementation of this measure could achieve improved air quality, water conservation, improved public health, and improved ecosystem health.

Sources

- U.S. Department of Agriculture (USDA). 2021. COMET-Planner. Available: http://www.comet-planner-cdfahsp.com/. Accessed: March 2021.

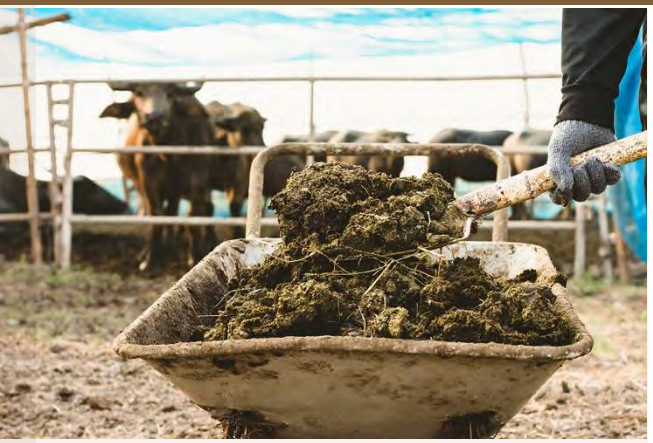
N-4. Require Best Management Practices for Manure Management



GHG Mitigation Potential

Varies

Variable reduction in GHG emissions from manure management practices

Co-Benefits (icon key on pg. 34)

Climate Resilience

Improving manure management can improve water and air quality, thereby improving community health and resilience. Depending on the alternative management practice, it can also increase the amount of compost produced, which can go toward gardens and farms and help improve soil health as well as food and crop production.

Health and Equity Considerations

Fertilizer and manure are major causes of groundwater contamination in California, especially in the Central Valley. Improved manure management can help to improve water quality for rural and vulnerable communities.

Measure Description

This measure will require best management practices for the management of manure from livestock. Well-managed pasture systems and aerobic dry composting systems tend to have lower emissions, while anaerobic wet handling systems generate more CH_4. This measure is thus intended for manure collection systems that are currently managed by anaerobic decomposition of manure volatile solids stored in a lagoon or other predominantly liquid anaerobic environment. Utilizing alternative practices to manage manure results in reduced agriculture emissions from livestock by decreasing the amount of volatile manure solids that are stored in wet, anaerobic conditions.

Scale of Application

Project/Site and Plan/Community

Implementation Requirements

Emission reductions can only be quantified for projects with existing manure management practices that include the anaerobic decomposition of manure volatile solids stored in a lagoon or other predominantly liquid anaerobic environment.

Cost Considerations

Incorporating best practices for manure management may entail initial costs to build the related storage and processing ability. Cost savings come in the form of reduced need for inputs like fertilizer if the manure is used on site and avoided water pollution and greenhouse gas emissions.

Expanded Mitigation Options

See the *GHG Reduction Formula* section below for tools to quantify GHG reductions from various alternative manure management practices.

GHG Reduction Formula

Users are directed to CARB's (2021) *Benefits Calculator Tool for the Alternative Manure Management Program* (AMMP tool). The AMMP tool quantifies GHG reductions from livestock manure management based on user-entered parameters, including the livestock type, number of cattle, the type of existing manure collection system, and the user's chosen alternative type of manure collection system. The AMMP tool is only applicable to users who have existing manure management practices that include the anaerobic decomposition of manure volatile solids stored in a lagoon or other predominantly liquid anaerobic environment.

The user can choose from many alternative manure management practices, such as pasture-based management, and various methods of solid separation and scrape conversion. The tool also quantifies GHG reductions from energy savings (e.g., MWh, diesel fuel gallons), if applicable.

Because of the wide range of manure management practices, which corresponds to GHG calculations that have many user-entered variables that influence the amount of GHGs reduced, this Handbook recommends that users use the AMMP tool directly. Tools like AMMP comprehensively account for these variables, enabling users easily to calculate the approximate benefits that each manure management practice will achieve.

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	GHGs reduced from alternative manure management	[ ]	MT CO_2e	calculated
User Inputs				
B	Project county	[ ]	text	user input
C	Type of alternative manure management practice to be adopted	[ ]	text	user input
D	Existing livestock by category	[ ]	text & number of livestock	user input
E	Existing manure collection practices	[ ]	text	user input
F	Existing number of months livestock spend at pasture	0–12	months	user input
G	Existing solid-separation and secondary solid separation	[ ]	text	user input
H	Existing storage/treatment practice for separated solids	[ ]	text	user input
I	Specification of milk produced, if applicable	[ ]	%	user input
J	Existing electricity consumption from manure management activities	[ ]	MWh per year	user input
K	Existing diesel fuel consumption from manure management activities	[ ]	gallons per year	user input
L	Alternative number of months livestock spend at pasture	0–12	months	user input

ID	Variable	Value	Unit	Source
M	Alternative solid-separation and secondary solid separation	[ ]	text	user input
N	Estimated alternative electricity consumption from alternative manure management activities	[ ]	MWh per year	user input
O	Estimated alternative diesel fuel consumption from alternative manure management activities	[ ]	gallons per year	user input
P	List of stationary and mobile sources associated with manure management activities	[ ]	text	user input
Constants, Assumptions, and Available Defaults				
	None			

Further explanation of key variables:

- (A) – The GHG reductions achieved by the implementation of alternative manure management practices are calculated by the AMMP tool. On the GHG Summary tab of the AMMP tool, the GHG reduction is given for a 5-year period. Thus, if the user would like to know the annual number of reductions, that value can be found on the For Technical Reviewers tab of the tool, or by simply dividing the 5-year reduction by 5.

  For more information on the inputs for the AMMP tool, users should refer to the AMMP tool user guide, which provides technical details on the input parameters of the tool (CARB 2019).

GHG Calculation Caps or Maximums

None.

Example GHG Reduction Quantification

The user's livestock operation in Sonoma County (B) currently has 400 lactating dairy cows in freestalls, 100 dry cows, and 100 grazing heifers (D). The current manure management technique has a flush system for freestalls and milking parlors (E), and all cattle are at pasture for 9 months per year (F, L). There is no solid separation currently, and this will not change for the alternative practices (G, H, M). The current energy consumption is 200 MWh per year of electricity (J) and 600 gallons per year of diesel fuel (K). The average milk production is 55 lbs per day per cow, with 3.75 percent milk fat, 3 percent true protein, and 4.9 percent lactose (I). The alternative manure management practice will involve the installation of a new compost bedded pack barn (C). With the alternative manure management practices, electricity consumption will be reduced to 150 MWh per year (N), and diesel consumption will increase to 1,200 gallons per year (O). Based on these inputs, the user will reduce GHG emissions by 2,720 MT CO_2e for five years, or 544 MT CO_2e per year. This example is taken from the AMMP tool user guide (CARB 2019).

Quantified Co-Benefits

The AMMP tool calculates criteria pollutant reductions (lb), fuel savings (gallons of diesel), and soil health benefits (tons of compost production). All values are over a 5-year project life.

Construction

Equipment and vehicles are the primary sources of GHG emissions in the construction sector. Construction equipment typically operates on construction sites and includes off-road sources like cranes, bulldozers, forklifts, and tractors. Vehicles are used for personnel, material, and equipment transport, as well as onsite material supply movement. Construction equipment and vehicles traditionally use diesel or gasoline fuel and release emissions based on the amount of fuel combusted and the emission certification level of the engine.

Equipment and vehicle emissions can be reduced by using engines that emit fewer pollutants for the same amount of work. This is typically equipment and vehicles powered by electricity or cleaner fuels (e.g., compressed natural gas, renewable diesel). The exclusive use of grid electricity by electric equipment and vehicles eliminates the diesel emissions at the site but increases indirect electricity emissions. However, grid-based emissions are typically less than the emissions from the diesel-fueled equipment (depending on the source of grid power). Hybrid-powered equipment and vehicles would decrease but not eliminate fuel use. The electricity for hybrid engines is self-generated, so it would not increase grid-based electrical generation and the associated emissions unless the equipment has plug-in capability. Likewise, depending on the fuel type, cleaner-fuel equipment and vehicles would decrease but not eliminate combustion emissions.

Emissions reductions achieved by electric-powered and cleaner-fuel equipment and vehicles are determined by finding the difference in emissions between those generated by the replacement power source and those generated by conventional fossil-fueled engines. Emissions for the mitigated scenario may consist of direct emissions from combustion fuel use, and/or indirect emissions from grid electricity. Resources and methods to quantify emissions reductions from measures that target cleaner-fuel equipment are described in this section. Measures that reduce vehicle fuel consumption through idling restrictions and local contractor provisions are also discussed. Use the below graphic to click on an individual measure to navigate directly to the measure's factsheet.

C-1-A. Use Electric or Hybrid Powered Equipment

Photo Credit: Granite Construction, March 2019

GHG Mitigation Potential

Potentially large reduction in GHG emissions from construction equipment

Co-Benefits (icon key on pg. 34)

Climate Resilience

Using electric- or hybrid-powered equipment can reduce sensitivity to fuel price shocks or scarcity. However, using all-electric equipment may decrease resilience if they are the only option available during a power outage.

Health and Equity Considerations

This measure will not only reduce air pollution for surrounding communities but also for onsite workers.

Measure Description

This measure requires use of electric- or hybrid-powered construction equipment over conventional diesel-fueled counterparts. Replacing diesel-powered equipment with electric or hybrid-electric equipment reduces fossil fuel combustion and thus GHG emissions. However, all-electric equipment results in GHG emissions from the electricity used to charge the equipment. The indirect GHG emissions increase from electricity must be calculated in addition to the GHG emissions reduction from displaced fossil fuel combustion to estimate the total net GHG emissions reduction achieved by this measure if using all-electric equipment. A variation of this measure is described in Measure C-1-B, *Use Cleaner-Fuel Equipment*.

Scale of Application

Project/Site and Plan/Community

Implementation Requirements

Note that while this measure discusses offroad equipment used for construction, this measure can also be implemented for other offroad equipment applications (e.g., agriculture, industrial).

Cost Considerations

Electric- or hybrid-powered equipment tends to be more expensive to purchase and install than conventional models powered by fossil fuels. These costs may be offset by savings in fuel use and maintenance.

Expanded Mitigation Options

Pair with Measure E-10, *Procure Electricity from Lower Carbon Intensity Power Supply*, to ensure that the energy supplied to power the electrified equipment has a lower carbon intensity than the local grid, thereby further reducing GHG emissions. Consider using portable batteries to support and extend implementation of this measure at more remote sites.

GHG Reduction Formula

$$A1 = (C \times D \times F \times G1 \times H) - (C \times D \times \mathbf{G2} \times I)$$

$$A2 = C \times D \times E \times \mathbf{G2} \times I$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A1	GHG reduction from using electric equipment	[ ]	MT CO_2e	calculated
A2	GHG reduction from using hybrid equipment	[ ]	MT CO_2e	calculated
User Inputs				
B	Fuel type of existing equipment	[ ]	text	user input
C	Hours of equipment operation	[ ]	hours	user input
G2	Carbon intensity of fossil-fueled equipment	[ ]	g CO_2e per hp-hour	CARB 2021
Constants, Assumptions, and Available Defaults				
D	Horsepower of equipment	Table C-1-B.1	hp	CARB 2021
E	Percent fuel reduction of hybrid equipment compared to conventional equipment	10	%	Holian and Pyeon 2017
F	Conversion from horsepower to MW	0.0007457	MW per hp	conversion
G1	Carbon intensity of local electricity provider	Tables E-4.3 and E-4.4	lb CO_2e per MWh	CA Utilities 2021
H	Conversion from lb to MT	0.000454	MT per lb	conversion
I	Conversion from g to MT	1 e^{-6}	MT per g	conversion

Further explanation of key variables:

- (B) – The fuel type of the existing equipment is used to obtain the carbon intensity of the equipment (G2) from OFFROAD.
- (D) – Average hp of various construction equipment are provided in Table C-1-B.1 in Appendix C, *Emission Factors and Data Tables* (CARB 2021). If the user can provide an equipment-specific hp, they should replace the default in the GHG calculation formula.
- (E) – The percent fuel reduction is used in this formula as a proxy for the percent activity reduction that would be expected with hybrid construction equipment. Based on a survey of 12 models of heavy construction equipment from 10 different manufacturers, hybrid construction equipment reduced fuel use by 10 to 45 percent, with an average of 28 percent (Holian and Pyeon 2017). To be conservative, the low end of the range is cited. If the user can provide an equipment-specific hp, the user should replace the default in the GHG calculation formula. If the user knows the make and model of the construction equipment used, the user should replace the default in the GHG calculation formula.

- (F) – Conversion factor assumes that energy requirements and losses are the same for both a fuel-powered engine and an electrically-charged engine.
- (G1) – GHG intensity factors for major California utilities are provided in Tables E-4.3 and E-4.4 in Appendix C. If the project study area is not serviced by a listed electricity provider, or the user is able to provide a project-specific value (i.e., for the future year not referenced in Appendix C), the user should replace the default in the GHG calculation formula. If the electricity provider is not known, the user may elect to use the statewide grid average carbon intensity.
- (G2) – GHG intensity factors for various construction equipment can be obtained from CARB's (2021) OFFROAD model. Note that the OFFROAD emissions rates are inclusive of equipment load. Therefore, the GHG reduction equation does not include a multiplier for load factor.

GHG Calculation Caps or Maximums

None.

Example GHG Reduction Quantification

The user reduces construction equipment emissions by replacing fossil fuel combustion with electricity consumption, which generates fewer GHG emissions per unit of activity. In this example, a 158-hp diesel excavator (D) that is used 8 hours per day (C) is replaced by an electric-powered equivalent. A 158-hp excavator has a carbon intensity of 530 g CO_2e per hp-hour (G2). The electricity provider for the project area is Silicon Valley Clean Energy, and the analysis year is 2025. The carbon intensity of electricity is, therefore, 5 lb CO_2e per megawatt-hour (G1).

$$A1 = \left(8\ \frac{\text{hours}}{\text{day}} \times 158\ \text{hp} \times 0.0007457\ \frac{\text{MW}}{\text{hp}} \times 5\ \frac{\text{lb CO}_2\text{e}}{\text{MWh}} \times 0.000454 \frac{\text{MT}}{\text{lb}}\right) - \left(8\ \frac{\text{hours}}{\text{day}} \times 158\ \text{hp} \times 530\ \frac{\text{g CO}_2\text{e}}{\text{hp-hour}} \times 1e^{-6} \frac{\text{MT}}{\text{g}}\right) = -0.7 \frac{\text{MT CO}_2\text{e}}{\text{day}}$$

Quantified Co-Benefits

Improved Air Quality

Reducing fossil-fuel combustion will also reduce local criteria pollutants. Emission savings can be calculated using the same formula used to quantify GHG reductions (A1 and A2). Criteria pollutant intensity factors for various construction equipment can be obtained from CARB's (2021) OFFROAD model.

Electricity supplied by statewide fossil-fueled or bioenergy power plants will generate criteria pollutants. However, because these power plants are located throughout the state, electricity consumption from equipment charging will not generate localized criteria pollutant emissions at the equipment source. Consequently, for the quantification of criteria pollutant emission reductions, either

the electricity portion of the equation can be removed, or the electricity intensity (G2) can be set to zero.

Energy and Fuel Savings

Fossil fuel savings are a product of the equipment fuel efficiency (gallons consumed per hour) and the equipment operating time (hours). Fuel intensity factors for various construction equipment can be obtained from CARB's OFFROAD model. Users should multiply the fuel intensity by the equipment operating hours to quantify fuel savings.

Increased electricity consumption for electric equipment is calculated as part of the GHG reduction formula (A1). The abbreviated formula is also shown below.

$$MWh = C \times D \times F$$

C-1-B. Use Cleaner-Fuel Equipment

Photo Credit: TruckPR, April 2017

GHG Mitigation Potential

Potentially small reduction in GHG emissions from construction equipment

Co-Benefits (icon key on pg. 34)

Climate Resilience

Using cleaner fuel equipment allows for fuel redundancy and can reduce sensitivity to price shocks or scarcity in conventional fuels.

Health and Equity Considerations

While most alternative fuels reduce both GHG and criteria pollutants, a few may increase criteria pollutant emissions. The most prominent example of this is biodiesel, which generally results in higher NOx emissions, but lower PM emissions compared to conventional diesel.

Measure Description

This measure requires use of cleaner-fueled construction equipment over conventional diesel- or gasoline-fueled counterparts. Depending on the fuel type, equipment type, and horsepower, equipment may emit fewer GHG for the same amount of work as equivalent diesel- or gasoline-fueled engines. A variation of this measure is described in Measure C-1-A, *Use Electric or Hybrid Powered Equipment*. Compressed natural gas (CNG) is specifically addressed in the quantification method for this measure, although users could expand to cover additional fuel types, such as renewable diesel.

Scale of Application

Project/Site and Plan/Community

Implementation Requirements

Note that while this measure discusses offroad equipment used for construction, this measure can also be implemented for other offroad equipment applications (e.g., agriculture, industrial).

Cost Considerations

Equipment powered by cleaner-fuels tend to be more expensive to purchase and install than less clean models. These costs may be offset by savings in fuel use and maintenance.

Expanded Mitigation Options

Other cleaner fuels available for use in construction equipment include renewable diesel, biodiesel, and hydrogen fuel cells. These fuels are not specifically captured by the current quantitative method for this measure.

GHG Reduction Formula

$$A = ((C \times D \times E2) - (C \times D \times E1)) \times F$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	GHG reduction from using cleaner-fuel equipment	[ ]	MT CO_2e	calculated
User Inputs				
B	Fuel types of existing and cleaner-fuel equipment	[ ]	text	user input
C	Hours of equipment operation	[ ]	hours	user input
E1	Carbon intensity of existing equipment	[ ]	g CO_2e per hp-hour	CARB 2021
E2	Carbon intensity of cleaner-fuel equipment	[ ]	g CO_2e per hp-hour	CARB 2021
Constants, Assumptions, and Available Defaults				
D	Horsepower of equipment (diesel, gasoline, and CNG equipment)	Table C-1-B.1	hp	CARB 2021
F	Conversion from g to MT	1 e^{-6}	MT per g	conversion

Further explanation of key variables:

- (A) – Depending on the fuel type, equipment type, and horsepower, the cleaner-fuel equipment may emit more GHGs than an equivalent gasoline- or diesel-fueled engine. The user should take care to consider the potential criteria pollutant co-benefits against possible GHG increases from the use of a cleaner fuel.
- (B) – The fuel type of the existing and cleaner-fuel equipment is used to obtain the carbon intensity of the equipment (E1 and E2) from CARB's (2021) OFFROAD.
- (D) – Average hp of various construction equipment are provided in Table C-1-B.1 in Appendix C (CARB 2021). If the user can provide an equipment-specific hp, they should replace the default in the GHG calculation formula.
- (E1 and E2) – GHG intensity factors for various construction equipment by fuel type can be obtained from CARB's (2021) OFFROAD model. Note that the OFFROAD emissions rates are inclusive of equipment load. Therefore, the GHG reduction equation does not include a multiplier for load factor.

GHG Calculation Caps or Maximums

None. If the emissions rate for the cleaner-fuel equipment exceeds that of the diesel- or gasoline-powered counterpart, this measure may result in a GHG emissions increase.

Example GHG Reduction Quantification

The user reduces construction equipment emissions by replacing gasoline or diesel combustion with CNG or renewable diesel consumption, which may generate fewer GHG emissions per unit of activity, depending on the piece of equipment and horsepower. In this example, a fleet of 23-hp diesel aerial lifts (D) that are used 40 hours per day (C) in 2022 is replaced by CNG-fueled equivalents. A 23-hp diesel aerial lift has a carbon intensity of 851g CO_2e per hp-hour (E1). The CNG-fueled equivalent has a hp of 19 and carbon intensity of 675g CO_2e per hp-hour (E2).

$$A = \left(\left(40\frac{\text{hours}}{\text{day}} \times 19 \text{ hp} \times 675\frac{\text{g } CO_2e}{\text{hp-hour}}\right) - \left(40\frac{\text{hours}}{\text{day}} \times 23 \text{ hp} \times 851\frac{\text{g } CO_2e}{\text{hp-hour}}\right)\right) \times 1e^{-6}\frac{\text{MT}}{\text{g}} = -0.3\frac{\text{MT } CO_2e}{\text{day}}$$

Quantified Co-Benefits

Improved Air Quality

Depending on the fuel type, equipment type, and horsepower, the cleaner-fuel equipment may emit more criteria pollutants than an equivalent gasoline- or diesel-fueled engine. Emission changes can be calculated using the same formula used to quantify GHG reductions (A). The carbon intensity factors (E1 and E2) should be replaced in the formula with the corresponding criteria pollutant intensity factors, which can be obtained from CARB's OFFROAD model.

Energy and Fuel Savings

This measure would displace use of fossil fuel (gasoline or diesel) with a cleaner fuel type (CNG). Total fuel consumption is a product of the equipment fuel efficiency (gallons consumed per hour) and the equipment operating time (hours). Fuel intensity factors for various construction equipment can be obtained from CARB's OFFROAD model. Users should multiply the fuel intensity factor by the equipment operating hours to quantify fuel changes for the existing and cleaner-fuel equipment.

C-2. Limit Heavy-Duty Diesel Vehicle Idling

GHG Mitigation Potential

Potentially small reduction in GHG emissions from construction vehicles

Co-Benefits (icon key on pg. 34)

Climate Resilience

Limiting vehicle idling saves fuels and can reduce sensitivity to price shocks or fuel scarcity.

Health and Equity Considerations

This measure will not only reduce air pollution for surrounding communities but also for onsite workers.

Measure Description

This measure limits heavy-duty vehicle idling beyond current regulatory restrictions. The Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling prohibits diesel-fueled commercial motor vehicles of more than 10,000 pounds from idling the vehicle's primary engine for 5 minutes at a single location (13 CCR Section 2485). There are some exceptions to the regulation, such as positioning or providing a power source for equipment or operations, such as lift, crane, pump, drill, hoist, or other auxiliary equipment. Reduction in idling time beyond the regulation would further reduce fuel consumption and thus emissions. Reducing idling benefits the health of construction workers as well as nearby residents and workers.

Scale of Application

Project/Site and Plan/Community

Implementation Requirements

The construction site manager should develop an enforceable mechanism that monitors the idling time to ensure compliance with this measure. Note that while this measure discusses heavy-duty vehicles used for construction, this measure can also be implemented for other vehicle applications (e.g., agriculture, industrial).

Cost Considerations

There are no initial costs associated with this measure. Restricting vehicle idling time beyond regulation will reduce fuel consumption, leading to long-term cost savings.

Expanded Mitigation Options

Pair with Measure T-30, *Use Cleaner-Fuel Vehicles,* to reduce the carbon intensity of fuels combusted during idling.

GHG Reduction Formula

$$A = (B - D) \times C \times E \times F \times G \times H$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	GHG reduction from idling limit	[ ]	MT CO_2e	calculated
User Inputs				
B	Idle restriction with measure implementation	[ ]	minutes/period	user input
C	Vehicle trips	[ ]	trips	user input
Constants, Assumptions, and Available Defaults				
D	Idle limit without the measure	5	minutes/period	13 CCR Section 2485
E	Idle periods per trip	2	period/trip	assumption
F	Vehicle idling emission factor	[ ]	g/idle hours	CARB 2021
G	Conversion from minutes to hour	0.0167	hours per minute	conversion
H	Conversion from g to MT	1 e^{-6}	MT per g	conversion

Further explanation of key variables:

- (A) – Emissions reductions are quantified per vehicle idling period. Daily emissions reductions can be quantified if the number of idling periods per day is known.
- (B) – The measure-imposed idle restriction must exceed the idle limit without the measure (D).
- (C) – Idle restrictions are imposed on vehicles idling at a single location. Vehicles may make multiple trips to that location or make trips to different locations but still be subject to the idling limit. Users should define the number of trips the vehicle will make for the analysis period (e.g., per day, per year).
- (D) – The Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling limits diesel-fueled commercial motor vehicle idling time to 5 minutes at a single location, with exceptions for some vehicles with auxiliary equipment powered by the primary engine. The user should determine the appropriate idling limit without the measure for such exempted vehicles.
- (E) – The quantification method assumes the vehicle will idle twice per trip at a single location: once during vehicle shutdown from the inbound trip and once during vehicle warmup for the outbound trip. Users should apply a different factor if the number of idle periods per trip is known.
- (F) – GHG intensity factors for diesel-fueled heavy vehicle idling can be obtained from CARB's (2021) EMFAC model.

GHG Calculation Caps or Maximums

None.

Example GHG Reduction Quantification

The user reduces vehicle idling emissions by enforcing an idling period of 3 minutes (B). In this example, a heavy-duty truck is regulated under the Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling. The idling limit without the measure is therefore 5 minutes at a single location (D). The vehicle has a gross vehicle weight of 35,000 pounds and will operate at a construction site in Los Angeles County in 2023. The vehicle will make 10 trips to the construction site per day (C). The idling carbon intensity is 6,375 g CO_2e per idle hour (F).

$$A = \left(3 \frac{\text{idle min}}{\text{period}} - 5 \frac{\text{idle min}}{\text{period}}\right) \times 10 \frac{\text{trips}}{\text{day}} \times 2 \frac{\text{period}}{\text{trip}} \times 6{,}375 \frac{\text{g}}{\text{idle·hr}}$$

$$\times 0.0167 \frac{\text{hr}}{\text{min}} \times 1e^{-6} \frac{\text{MT}}{\text{g}} = <\text{-}0.1 \frac{\text{MT } CO_2e}{\text{day}}$$

Quantified Co-Benefits

Improved Air Quality

Reducing fossil-fuel combustion from idling restrictions will also reduce local criteria pollutants. The reduction in criteria pollutant emissions can be calculated using the GHG reduction formula, where (F) represents the criteria pollutant intensity factors obtained from CARB's (2021) EMFAC model.

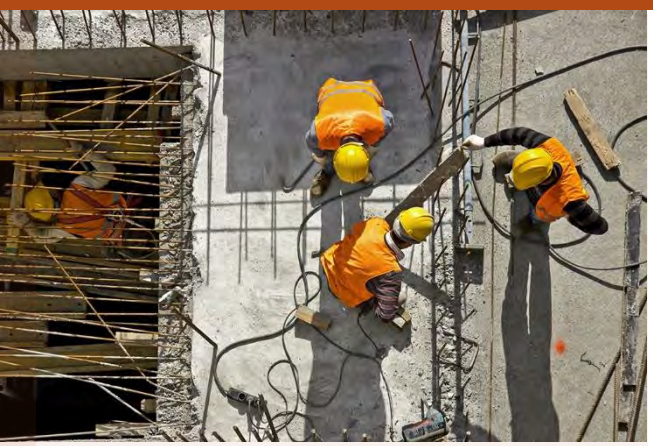
C-3. Use Local Construction Contractors



GHG Mitigation Potential

Varies

Variable reduction in GHG emissions from construction worker vehicles

Co-Benefits (icon key on pg. 34)

Climate Resilience

Reducing worker commute trip lengths saves fuels and can reduce sensitivity to price shocks or fuel scarcity.

Health and Equity Considerations

Refer to Measure IEP-1, *Local Labor and Apprenticeships (Construction)*, in Chapter 5.

Measure Description

This measure requires use of local construction contractors. Contracting construction work with a local company reduces VMT associated with construction employee commute distances and, therefore, reduces emissions from vehicle fuel combustion. Local hire provisions may cover the entire workforce or a percentage of the workforce based on the project size or employment type.

Scale of Application

Project/Site and Plan/Community

Implementation Requirements

Local hiring requirements should be expressed in the contractor bid specifications. Note that this measure is specific to local hire provisions for employees reporting to the construction site. Measure C-4, *Use Local and Sustainable Building Materials*, requires use of local building materials, which can reduce VMT and emissions from vendor and delivery trips.

Cost Considerations

Local and skilled workforce provisions can promote economic development, channeling some of the economic value of development directly to the community in which it is building. Decreased worker commute times and fuel savings may generate additional discretionary funds. Reduced car use may decrease the need for infrastructure spending on road maintenance.

Expanded Mitigation Options

Local workforce provisions may increase the likelihood of employee commute trips by transit, walking, or biking. Potential GHG reductions from mode shift are not reflected in the quantification methodology. Partner with local transit agencies to provide discounted transit passes to further incentivize alternative transportation.

Consider additional provisions for workforce training to bolster development of skilled trades and further economic growth. Requirements may include workers who have graduated from a Joint Labor Management apprenticeship training program approved by the State of California or who have at least as many hours of on-the-job experience in the appliable craft or are registered in an apprenticeship training program.

GHG Reduction Formula

$$A = (B - D) \times C \times E \times F \times G$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	GHG reduction from using local construction contractors	[ ]	MT CO_2e	calculated
User Inputs				
B	Distance provision of local hiring requirement	[ ]	miles/one-way trip	user input
C	Number of employees	[ ]	employees	user input
Constants, Assumptions, and Available Defaults				
D	Countywide average one-way employee commute trip distance	Table C-3.1	miles/one-way trip	2015 CSTMD
E	Employee trips per day	2	trips per employee	assumption
F	Vehicle emission factor	[ ]	g CO_2e per mile	CARB 2021
G	Conversion from g to MT	1 e^{-6}	MT per g	conversion

Further explanation of key variables:

- (B) – The local hire provision should specify the maximum average one-way travel distance for contracted staff.
- (C) – The number of employees required to report to the construction site and subject to the provision must be provided by the user.
- (D) – The average countywide vehicle trip lengths from the 2015 California Statewide Travel Demand Model (CSTDM) are provided in Table C-3.1 in Appendix C. The data are for home-based-work trips by traffic analysis zone averaged to the county level.
- (E) – The quantification method assumes all employees will make both an inbound and outbound trip per day.
- (F) – Users should obtain the carbon intensity of employee commute vehicles from CARB's (2021) EMFAC model. Employee commute vehicles are generally classified as light-duty automobiles (LDA) and trucks (light-duty truck class 1 [LDT1] and 2 [LDT2]). Users may obtain a weighted carbon intensity of these vehicle types using a 25/50/25 percent mix of LDA, LDT1, and LDT2, respectively. Alternatively, users may apply different weightings of vehicle fleet mixes if project-specific information is available.

GHG Calculation Caps or Maximums

(B<D). For implementation of this measure to result in a GHG reduction, the maximum average allowable travel distance must be less than the average countywide vehicle trip length assumed in the calculation.

Example GHG Reduction Quantification

The user reduces employee commute emissions by requiring all contracted employees to be located within a certain distance of a construction project. In this example, the construction project requires 100 employees per day (C) and is in Alameda County, where the average countywide home-based-work vehicle trip length from the 2015 CSTDM is 11.98 miles (D). The contractor agreement requires all staff reporting to the construction site to reside no more than 10 miles from the project (B). The weighted average carbon intensity for employee commute vehicles in Alameda County for the analysis year from EMFAC is 281 grams per mile (F).

$$A = \left(10 \frac{\text{miles}}{\text{trip}} - 11.98 \frac{\text{miles}}{\text{trip}}\right) \times 100 \frac{\text{employees}}{\text{day}} \times 2 \frac{\text{trips}}{\text{employee}}$$

$$\times 281 \frac{\text{g } CO_2e}{\text{mi}} \times 1e^{-6} \frac{\text{MT}}{\text{g}} = 0.1 \frac{\text{MT } CO_2e}{\text{day}}$$

Quantified Co-Benefits

VMT Reductions

Contracting construction work with a local company reduces construction employee commute VMT. The reduction in VMT can be calculated using the GHG reduction formula with the exception that (F and G) should be replaced with a value of 1 or otherwise be removed from the equation.

Energy and Fuel Savings

This measure will achieve vehicle fuel savings by reducing employee commute VMT. Total fuel consumption is a product of the vehicle fuel efficiency (gallons consumed per mile) and miles traveled. Fuel intensity factors can be obtained from CARB's (2021) EMFAC model. Users should multiply the vehicle fuel intensity factor by the VMT reduction (see above) to quantify fuel savings.

Improved Air Quality

Reducing fossil-fuel combustion from a local hire provision will also reduce local criteria pollutants. The reduction in criteria pollutant emissions can be calculated using the GHG reduction formula, where (F) represents the criteria pollutant intensity factors obtained from CARB's (2021) EMFAC model.

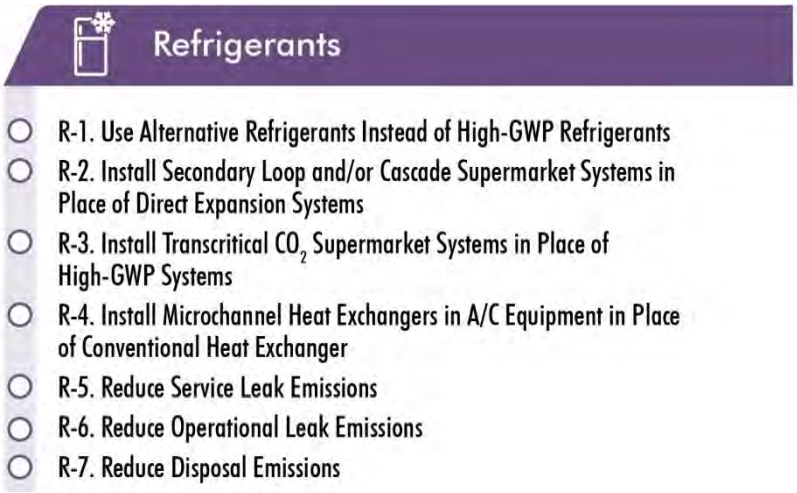
Refrigerants

Refrigerants are substances used in equipment for cooling and heating purposes. Most of the refrigerants used today are HFCs or blends thereof. HFCs are the third generation of synthetic fluorinated chemicals and were used to replace ozone depleting refrigerants. However, HFCs are potent GHGs that often have high GWP values. Different types of refrigeration equipment are used by different types of land uses. For example, an office may use various types of A/C equipment, while a supermarket may use both A/C equipment and refrigeration equipment.

All equipment that uses refrigerants has a charge size (i.e., quantity of refrigerant the equipment contains), and an operational refrigerant leak rate, and each refrigerant has a GWP that is specific to that refrigerant. The GWPs of common refrigerants are presented in Table R-1.1 in Appendix C, *Emissions Factors and Data Tables*. For purposes of calculating refrigerant emissions in this Handbook, the equipment charge sizes and leak rates have been determined for relevant land use and equipment types. This information is presented in Tables R-1.2 through R-1.5 in Appendix C.

Emissions from equipment can be reduced by decreasing the charge size and/or leak rate, or replacing the baseline refrigerant with a lower GWP refrigerant. The quantification method for all refrigerant measures, except Measure R-7, address emissions generated during equipment operation. Measure R-7 reduces emissions from the disposal of refrigeration and A/C equipment at the end of its lifetime. The quantification approach for Measure R-7 includes lifecycle considerations (i.e., downstream emissions) and, as a result, emission reductions from this measure should not be compared to the emission reductions calculated for other refrigeration measures in this Handbook, which do not include lifecycle emissions.



Use the graphic to click on an individual measure to navigate directly to the measure's factsheet.

R-1. Use Alternative Refrigerants Instead of High-GWP Refrigerants

GHG Mitigation Potential

Up to a 100% reduction in GHG emissions during operation

Co-Benefits (icon key on pg. 34)

Climate Resilience

Climate resilience benefits vary by alternative refrigerant; for example, use of NH_3 can reduce energy consumption, thereby reducing the strain on the overall grid, particularly the risk of power outages during peak loads. Reduced energy consumption would also reduce energy costs, particularly if extreme heat would otherwise increase these costs.

Health and Equity Considerations

Evaluate the entire lifecycle impact of alternative refrigerants and avoid those that will degrade into persistent chemicals harmful to the environment. Equipment should be installed in locations with adequate space and/or ventilation in accordance with U.S. EPA and CARB recommendations.

Measure Description

This measure replaces high-GWP refrigerants with lower-GWP refrigerants (e.g., natural refrigerants such as CO_2, ammonia [NH_3], and hydrocarbons, or next generation low-GWP synthetic refrigerants like hydrofluoroolefin-1234yf) in refrigeration and A/C equipment. When emitted into the atmosphere, high-GWP refrigerants (e.g., HFCs) absorb significantly more heat than CO_2 on a mass basis, resulting in larger global warming effects. Shifting to lower-GWP refrigerants reduces the potency of refrigerant leaks, decreasing GHG emissions on a CO_2e basis.

Scale of Application

Project/Site

Implementation Requirements

See measure description.

Cost Considerations

Implementation may require retrofitting existing equipment or purchasing new equipment, which may result in high initial capital costs. Alternative refrigerants, if synthetic and patented, may cost more than conventional refrigerants. Natural, non-patented refrigerants may cost less. Costs differences are expected to decrease over time with increased availability and commercialization of alternative refrigerants. Savings may also be achieved through increased energy efficiency of a refrigerant system using an alternative refrigerant.

Expanded Mitigation Options

Evaluate the entire lifecycle impact of alternative refrigerants and avoid those that will degrade into persistent chemicals harmful to the environment so as to improve local air quality, public health, and ecosystem health. Ensure that Clean Air Act and other regulations are followed during refrigerant disposal.

GHG Reduction Formula

$$A = \frac{(B \times C \times G) - (D \times E \times F)}{(D \times E \times F)}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from refrigerant emissions	0–100	%	calculated
User Inputs				
B	Total alternative refrigerant charge size	[ ]	kg	user input
C	Annual leak rate of equipment with alternative refrigerant	[ ]	%	user input
Constants, Assumptions, and Available Defaults				
D	HFC refrigerant charge size	Tables R-1.2 through R-1.5	kg	U.S. EPA 2016
E	Annual leak rate of equipment with HFC refrigerant	Tables R-1.2 through R-1.5	%	U.S. EPA 2016
F	GWP of HFC refrigerant	Table R-1.1	unitless	IPCC 2007
G	GWP of alternative refrigerant	Table R-1.1	unitless	IPCC 2007 and WMO 2018

Further explanation of key variables:

- (B, D) – The equipment charge size is the total quantity of refrigerant installed in the refrigeration or A/C equipment. The charge size may be the same for equipment using HFC and alternative refrigerants, or it may differ. Default charge sizes for equipment with HFC refrigerants are provided in Tables R.1-2 through R-1.5 in Appendix C. If the user can provide a project-specific value, they should replace the default quantity of refrigerant installed in the GHG reduction formula. Charge size for alternative refrigerants would vary by equipment type. In the case where the alternative charge size is not known, the corresponding HFC refrigerant charge size may be used as a substitute.
- (C, E) – Based on industry data, the average annual leak rates for the given equipment type, including operational and servicing leak rates for the equipment throughout the year. The leak rate may be the same for equipment using HFC and alternative refrigerants, or it may differ. Default leak rates for equipment with HFC refrigerants are provided in Tables R.1-2 through R-1.5 in Appendix C. These are average values and may vary with specific systems. Leak rates for alternative refrigerants would vary by equipment type. In the case where the alternative leak rate is not known, the corresponding HFC refrigerant leak rate may be used as a substitute.
- (F, G) – The GWP measures the contribution to global warming from the release of one unit of the given refrigerant relative to CO_2 on a 100-year time horizon. The GWPs of common refrigerants and alternatives are provided in Table R-1.1 in Appendix C.

GHG Calculation Caps or Maximums

This measure has a maximum GHG emissions reduction of 100 percent.

Example GHG Reduction Quantification

The user reduces high-GWP emissions by replacing a high-GWP refrigerant with a lower-GWP refrigerant alternative. In this example, a 60,000-sf supermarket has a conventional direct expansion system with 1,360 kg (D) of R-404A and a total leak rate of 33 percent (E). The supermarket also has A/C equipment with 13 kg (D) of R-410A and a total leak rate of 8 percent (E). The GWPs of R-404A and R-410A are 3,922 and 2,088 (F), respectively. The user replaces R-404A with R-448, a refrigerant with a GWP of 1,387 (G), and R-410A with R-407C, a refrigerant with a GWP of 1,774 (G). The charge sizes and leak rates for the alternative equipment would be the same as the high-GWP counterpart. Note that the A/C refrigerant transition from R-410A to R-407C is included for illustrative purposes and that this transition in supermarkets is not currently happening in practice. This would reduce GHG emissions from the refrigeration and A/C systems at the supermarket by 65 percent.

$$A = \frac{((\mathbf{1{,}360\ kg} \times \mathbf{33\%} \times 1{,}387)+(\mathbf{13\ kg} \times \mathbf{8\%} \times 1{,}774)) - ((1{,}360\ \text{kg} \times 33\% \times 3{,}922)+(13\text{kg} \times 8\% \times 2{,}088))}{((1{,}360\ \text{kg} \times 33\% \times 3{,}922)+(13\ \text{kg} \times 8\% \times 2{,}088))} = -65\%$$

Quantified Co-Benefits

Energy and Fuel Savings

Depending on system type and refrigerant selected, successful implementation of this measure could result in energy savings or energy penalties (U.S. EPA 2019). This co-benefit cannot be quantified for the purposes of this general methodology.

R-2. Install Secondary Loop and/or Cascade Supermarket Systems in Place of Direct Expansion Systems

GHG Mitigation Potential

Up to a 100% reduction in GHG emissions during operation

Co-Benefits (icon key on pg. 34)

Climate Resilience

Increased energy efficiency in refrigeration systems can reduce the strain on the overall grid, particularly the risk of power outages during peak loads. Increased efficiency can also reduce energy costs, particularly if extreme heat would otherwise increase these costs.

Health and Equity Considerations

Non-applicable

Measure Description

This measure replaces conventional direct expansion systems in supermarkets with indirect systems such as secondary loop and cascade systems. Currently, direct expansion systems are the most used refrigeration system type in supermarkets in the U.S. (U.S. EPA 2016). Whereas direct expansion systems circulate one refrigerant from the machinery room out to the store and back to the machinery room, indirect systems employ a primary and secondary refrigerant or heat transfer fluid (U.S. EPA 2016, 2019). In secondary loop systems, the primary refrigerant remains in the machine room and cools the secondary fluid, which is then pumped throughout the store to cool products. Another type of indirect system is a cascade system, which contains two refrigeration systems that share a common heat exchanger. These systems often use HFCs, NH_3, or hydrocarbons as the primary refrigerant. Often water mixed with glycol is used as the secondary heat transfer fluid in secondary loop systems; CO_2 is often used as the second refrigerant in cascades. By either confining HFCs to the machinery room as the primary refrigerant or removing HFCs entirely (as in NH_3 and hydrocarbon systems), these systems require significantly lower refrigerant charge and have lower leak rates than conventional direct expansion systems (U.S. EPA 2013a, 2019). Decreasing the refrigerant charge and leak rates results in a reduction of potential direct GHG emissions.

Scale of Application

Project/Site

Implementation Requirements

See measure description.

Cost Considerations

While both secondary loop and cascade supermarket systems have a higher initial cost over traditional systems, minimized costs associated with rechanging systems due to reduced leakage and energy efficiency improvements may provide a net cost savings over the lifetime of the systems.

Expanded Mitigation Options

Pair with Measure R-1, *Use Alternative Refrigerants Instead of High-GWP Refrigerants*, for increased GHG reductions in supermarket refrigerant systems.

GHG Reduction Formula

$$A = \frac{[(B \times F \times H)+(C \times F \times I)] - (D \times E \times G)}{D \times E \times G}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from refrigerant emissions	0–100	%	calculated
User Inputs				
B	Equipment charge size of secondary loop and/or cascade system	[ ]	kg	user input
C	Equipment charge size of secondary refrigerant in secondary loop and/or cascade system	[ ]	kg	user input
Constants, Assumptions, and Available Defaults				
D	Equipment charge size of conventional direct expansion system	1,633	kg	U.S. EPA 2013a
E	Annual leak rate of conventional direct expansion system	25	%	U.S. EPA 2013b
F	Annual leak rate of secondary loop and/or cascade system	5–15	%	U.S. EPA 2013a
G	GWP of HFC refrigerant	Table R-1.1	unitless	IPCC 2007 and WMO 2018
H	GWP of HFC refrigerant	Table R-1.1	unitless	IPCC 2007 and WMO 2018
I	GWP of refrigerant	Table R-1.1	unitless	IPCC 2007 and WMO 2018

Further explanation of key variables:

- (B) – The equipment charge size is the total quantity of the primary refrigerant installed in refrigeration or A/C equipment.
- (C) – The equipment charge size is the total quantity of the secondary refrigerant installed in refrigeration or A/C equipment.
- (D) – Based on industry data, the equipment charge size of a conventional direct expansion system is 1,633 kg. If the user can provide a project-specific value, they should replace the default conventional direct expansion system charge size in the GHG reduction formula.
- (E and F) – Based on industry data, the average annual leak rates for the given equipment type, including operational and servicing leak rates for the equipment

throughout the year. Leak rates are provided as averages and may vary with specific systems.

- (G, H, and I) – The GWP of the refrigerant measures the contribution to global warming from the release of one unit of the given refrigerant relative to CO_2 on a 100-year time horizon. The GWP of common refrigerants and alternatives is provided in Table R-1.1 in Appendix C.

GHG Calculation Caps or Maximums

This measure has a maximum GHG emissions reduction of 100 percent.

Example GHG Reduction Quantification

The user reduces high-GWP refrigerant emissions by replacing a conventional direct expansion system in a supermarket with a secondary loop system. In this example, the conventional direct expansion system refrigerant is R-404A, which has a GWP of 3,922 (G). The direct expansion system equipment charge size of 1,633 kg (D) is assumed. The charge size for the primary refrigerant (R-407A) in the secondary loop system is 1,145 kg (B) and the GWP is 2,107 (H). The charge size for the heat transfer fluid refrigerant using water is 1,145 kg (C) with a GWP of 0 (I). Implementation of this project would reduce GHG emissions from the refrigeration system at this supermarket by 77 percent.

$$A = \frac{((1{,}145\ \text{kg} \times 15\% \times 2{,}107) + (1{,}145\ \text{kg} \times 15\% \times 0)) - (1{,}633\ \text{kg} \times 25\% \times 3{,}922)}{(1{,}633\ \text{kg} \times 25\% \times 3{,}922)} = -77\%$$

Quantified Co-Benefits

Energy and Fuel Savings

Successful implementation of this measure could achieve energy savings. While historically secondary loop and/or cascade systems have reduced energy efficiency, the past 15 years of development have resulted in energy efficiency improvements ranging from 0.5 percent to 35 percent compared to conventional direct expansion systems (U.S. EPA 2013a; Pan et al. 2020). Note that this range of values is a historical average and that, unlike the GHG reduction formula, the energy savings cannot be precisely quantified using a predictive formula for the purposes of this methodology.

R-3. Install Transcritical CO_2 Supermarket Systems in Place of High-GWP Systems

GHG Mitigation Potential

Up to a 99.9 percent reduction in GHG emissions during operation

Co-Benefits (icon key on pg. 34)

Climate Resilience

Climate resilience benefits vary by climate; in cooler and more dry climates, a CO_2 transcritical system can be at parity or more energy efficient than conventional direct expansion systems. Increased energy efficiency in refrigeration systems can reduce the strain on the overall grid, particularly the risk of power outages during peak loads. Increased efficiency can also reduce energy costs, particularly if extreme heat would otherwise increase these costs.

Health and Equity Considerations

Non-applicable

Measure Description

This measure replaces conventional direct expansion systems in supermarkets with CO_2 transcritical systems. Whereas direct expansion systems typically use a high-GWP refrigerant, CO_2 transcritical systems use CO_2, which has a GWP of 1 and a lower leakage rate than typical conventional direct expansion systems. By reducing annual leak rates and replacing high-GWP refrigerants with CO_2, these systems result in a reduction of potential direct GHG emissions. CO_2 transcritical systems operate at high pressures but otherwise operate similarly to conventional direct expansion systems. Typically, the charge size of these systems is comparable to conventional direct expansion systems. CO_2 transcritical systems work most efficiently in cooler climates; but can also be used in warmer climates (Belusko et al. 2019; U.S. EPA 2019). Transcritical CO_2 systems can be used in all California climate zones given California's latest building codes require the use of specialized equipment to ensure that energy penalties are minimized.

Scale of Application

Project/Site

Implementation Requirements

See measure description.

Cost Considerations

Transcritical CO_2 supermarket systems carry a high initial cost over traditional systems. However, CO_2 systems have a lower operating cost, mainly due to the cost of CO_2 being much lower than the cost of conventional refrigerants.

Expanded Mitigation Options

Measure is a subset of Measure R-1, *Use Alternative Refrigerants Instead of High-GWP Refrigerants*, which should be selected for increased GHG reductions in supermarket refrigerant systems.

GHG Reduction Formula

$$A = \frac{(E \times G \times \mathbf{B}) - (D \times F \times C)}{D \times F \times C}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from refrigerant emissions	0–99.9	%	Calculated
User Inputs				
B	Equipment charge size of CO_2 transcritical system	[ ]	kg	user input
Constants, Assumptions, and Available Defaults				
C	Equipment charge size of conventional direct expansion system	1,633	kg	U.S. EPA 2019
D	Annual leak rate of conventional direct expansion system	25	%	U.S. EPA 2013
E	Annual leak rate of CO_2 transcritical system	15	%	U.S. EPA 2019
F	GWP of HFC refrigerant	Table R-1.1	unitless	IPCC 2007
G	GWP of alternative refrigerant (CO_2)	1	unitless	IPCC 2007

Further explanation of key variables:

- (B) – The equipment charge size is the total quantity of refrigerant installed in refrigeration or A/C equipment.
- (C) – Based on industry data, the equipment charge size of a conventional direct expansion system is 1,633 kg. If the user can provide a project-specific value, they should replace the default conventional direct expansion system charge size in the GHG reduction formula.
- (D and E) – Based on industry data, the average annual leak rates for the given equipment type are provided. This includes operational and servicing leak rates for the equipment throughout the year. Leak rates are provided as averages and may vary with specific systems.
- (F and G) – The GWP of the refrigerant measures the contribution to global warming from the release of one unit of the given refrigerant relative to CO_2 on a 100-year time horizon. The GWP of common refrigerants and alternatives is provided in Table R-1.1 in Appendix C.

GHG Calculation Caps or Maximums

This measure has a maximum GHG emissions reduction of 99.9 percent.

Example GHG Reduction Quantification

The user reduces high-GWP emissions by replacing a conventional direct expansion system with a CO_2 transcritical system in a supermarket. In this example, the conventional direct expansion system refrigerant is R-404A, which has a GWP of 3,922 (G), and a charge size of 1,633 kg (D). The charge size for a CO_2 transcritical system is also 1,633 kg (B) and it has a 15 percent leak rate (F). Implementation of this project would reduce GHG emissions from the refrigeration system at this supermarket by 99.9 percent.

$$A = \frac{(15\% \times 1 \times \mathbf{1{,}633\ kg}) - (25\% \times 3{,}922 \times 1{,}633\ kg)}{25\% \times 3{,}922 \times 1{,}633\ kg} = -99.9\%$$

Quantified Co-Benefits

Energy and Fuel Savings

Successful implementation of this measure could achieve energy and fuel savings. Depending on the climate in which a CO_2 transcritical system is installed, energy efficiency can show improvements up to 10 percent (U.S. EPA 2019). These improvements decrease, or become negative, in warmer and more humid climates (U.S. EPA 2019; Belusko et al. 2019). Note that, unlike the GHG reduction formula, the energy savings cannot be precisely quantified using a predictive formula for the purposes of this methodology.

Accessed: January 2021.

R-4. Install Microchannel Heat Exchangers in A/C Equipment in Place of Conventional Heat Exchanger

GHG Mitigation Potential

Up to a 35.0% reduction in GHG emissions during operation

Co-Benefits (icon key on pg. 34)

None

Climate Resilience

Non-applicable

Health and Equity Considerations

Microchannel heat exchangers can reduce noise produced by the condenser fan.

Measure Description

This measure replaces conventional heat exchangers in A/C equipment (e.g., unitary A/C) with microchannel heat exchangers (MCHX). Whereas conventional heat exchangers use single or multiple large-diameter tubes to transfer heat in A/C equipment, MCHX use a series of small tubes. A/C equipment using MCHX require 35 percent to 40 percent less refrigerant than those using conventional heat exchangers (U.S. EPA 2019). The reduction in refrigerant charge in A/C equipment results in a reduction of potential GHG emissions.

Scale of Application

Project/Site

Implementation Requirements

See measure description.

Cost Considerations

MCHX have a lower overall equipment cost compared to conventional heat exchangers. Long-term maintenance costs are comparable.

Expanded Mitigation Options

Pair with Measure R-1 *Use Alternative Refrigerants Instead of High-GWP Refrigerants*, for increased GHG reductions in A/C equipment.

GHG Reduction Formula

A = -B

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from refrigerant emissions	35	%	calculated
User Inputs				
	None			
Constants, Assumptions, and Available Defaults				
B	Assumed charge size reduction due to MCHX	35	%	U.S. EPA 2019

Further explanation of key variables:

- (B) – Based on industry data, the percent reduction in charge size obtained from using MCHX in A/C equipment is provided as an average reduction across A/C equipment.

GHG Calculation Caps or Maximums

This measure has a maximum GHG emissions reduction of 35 percent.

Example GHG Reduction Quantification

The user reduces high-GWP emissions replacing a conventional heat exchanger in A/C equipment with MCHX. Implementation of this project would reduce GHG emissions from the A/C equipment by 35 percent.

A = -35%

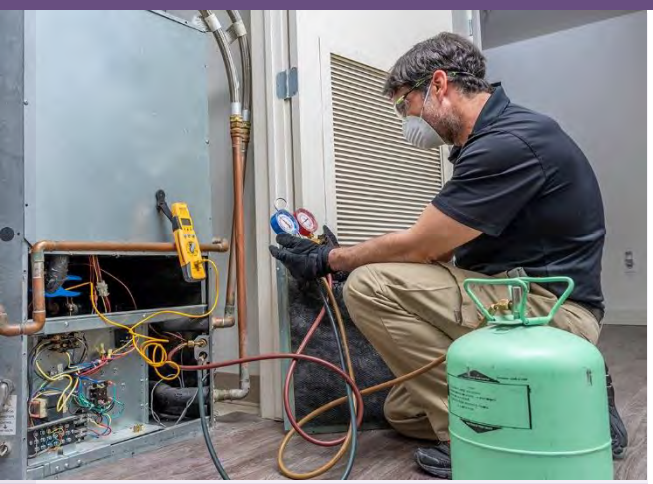
Quantified Co-Benefits

None.

Sources

- U.S. Environmental Protection Agency (U.S. EPA). 2019. *Global Non-CO_2 Greenhouse Gas Emission Projections & Marginal Abatement Cost Analysis: Methodology Documentation*. U.S. EPA Office of Atmospheric Programs, EPA-430-R-19-012, Washington, DC, September 2019. Available: https://www.epa.gov/sites/production/files/2019-09/documents/nonco2_methodology_report.pdf. Accessed: January 2021.

R-5. Reduce Service Leak Emissions



GHG Mitigation Potential

Up to 95.0% reduction in GHG emissions during servicing

Co-Benefits (icon key on pg. 34)

None

Climate Resilience

Non-applicable

Health and Equity Considerations

Non-applicable

Measure Description

This measure reduces emissions of refrigerants during equipment servicing by employing improved refrigerant servicing technologies and practices. It is estimated that recovering refrigerants can reduce emissions in servicing by up to 95 percent (U.S. EPA 2019). Through implementation of refrigerant recovery, overall service GHG emissions can be reduced. Equipment should only be serviced by qualified technicians certified under Section 608 of the Clean Air Act and who also hold an active California contractor's license in accordance with California's Refrigerant Management Program (CARB 2020). Under CARB regulations, technicians must make a recovery attempt using refrigerant recovery or recycling equipment for that type of appliance and refrigerant type before opening the appliance to atmospheric conditions. Implementing more widespread and thorough refrigerant recovery practices while servicing refrigeration and A/C systems would go beyond regulatory requirements.

Scale of Application

Project/Site

Implementation Requirements

Require that all appliances are serviced by a qualified technician who must make a recovery attempt using refrigerant recovery or recycling equipment for each appliance and refrigerant type before opening the appliance to atmospheric conditions, in accordance with existing state and federal regulations.

Cost Considerations

Costs associated with reducing service leak emissions may include installation of leak detection systems and increased staff time to monitor and maintain the system. The benefit of reducing leak emissions depends on the price of the refrigerant and the quantity of leaked refrigerant. Because many refrigerants carry a high cost, detecting and repairing leaks is expected to provide a net cost savings and will also allow for quick and accurate servicing.

Expanded Mitigation Options

Non-applicable.

GHG Reduction Formula

$$A = \frac{B - C}{C}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from service emissions	0–95.0	%	calculated
User Inputs				
	None			
Constants, Assumptions, and Available Defaults				
B	Equipment service leak rate with measure	2	%	U.S. EPA 2020
C	Equipment service leak rate without measure	Tables R-1.2 through R-1.5	%	U.S. EPA 2016

Further explanation of key variables:

- (B) – The updated service leak rate of the equipment after improved technology and/or practices. Leak rates vary between equipment types. A service leak rate of 2 percent can be assumed in the event project-specific information is not available (U.S. EPA 2020). The user should replace this default in the GHG reduction formula if the user is able to provide a project-specific equipment leak rate.
- (C) – The service leak rate of the equipment.

GHG Calculation Caps or Maximums

This measure has a maximum GHG emissions reduction of 95.0 percent.

Example GHG Reduction Quantification

The user reduces service emissions by increasing refrigerant recovery during servicing. In this example, the user operates a commercial A/C and heat pump at a restaurant. The current service leak rate is 4 percent (C). The improved servicing leak rate of the equipment (B) is 2 percent, reducing GHG emissions by 50 percent.

$$A = \frac{2\% - 4\%}{4\%} = -50\%$$

Quantified Co-Benefits

None.

Available: https://www.epa.gov/ghgemissions/inventory-us-greenhouse-gas-emissions-and-sinks-1990-2018. Accessed: January 2021.

R-6. Reduce Operational Leak Emissions

GHG Mitigation Potential

Up to 99.9% reduction in GHG emissions during operation

Co-Benefits (icon key on pg. 34)

None

Climate Resilience

Non-applicable

Health and Equity Considerations

Non-applicable

Measure Description

This measure reduces emissions from leakage of refrigerants during operation, decreasing emissions of refrigerants. A typical food retail store leaks an estimated 25 percent of refrigerants, or approximately 1,000 pounds annually (U.S. EPA 2013). Currently, under Section 608 of the Clean Air Act, corrective action must be taken when an appliance with a full charge of 50 or more pounds is discovered to be leaking ozone depleting substances that exceeds the applicable trigger rate. The trigger rate for industrial process refrigeration is 30 percent, commercial refrigeration 20 percent, and comfort cooling and all other appliances is 10 percent. Through implementing leak detection technology and preventative maintenance measures, leakages can be resolved before reaching trigger rates, thus significantly reducing GHG emissions (U.S. EPA 2020).

Scale of Application

Project/Site

Implementation Requirements

Under California's Refrigerant Management Program, leak inspections are required monthly for large refrigeration systems, quarterly for medium systems, and annually for small systems (CARB 2020). When reducing leak emissions, best practices include regularly conducted visual inspections to ensure no leakages occur. If a leak does occur, repairs must be made within 14 days of detection (CARB 2020).

Cost Considerations

Costs associated with reducing operational leak emissions may include installation of leak detection systems and increased staff time to monitor and maintain the detection system. The benefit of reducing leak emissions depends on the price of the refrigerant and the quantity of leaked refrigerant. Because many refrigerants carry a high cost, detecting and repairing leaks is expected to provide a net cost savings.

Expanded Mitigation Options

Non-applicable.

GHG Reduction Formula

$$A = \frac{B - C}{C}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from leak emissions	0–99.9	%	calculated
User Inputs				
B	Improved equipment leak rate with measure	[ ]	%	user input
Constants, Assumptions, and Available Defaults				
C	Annual equipment leak rate without measure	Tables R-1.2 through R-1.5	%	U.S. EPA 2016

Further explanation of key variables:

- (B) – The improved leak rate of the equipment after leak detection, leak repair, and leak prevention measures have been implemented. This varies on a case-by-case basis due to differences in equipment and leak control technologies used.
- (C) – The annual operational leak rate of the equipment.

GHG Calculation Caps or Maximums

This measure has a maximum GHG emissions reduction of 99.9 percent.

Example GHG Reduction Quantification

The user reduces operational leak rates by installing leak detection technology and increasing regular maintenance of the equipment. In this example, the user operates refrigeration and condensing units at a supermarket. The current operational leak rate is 25 percent (C) and the updated leak rate of the equipment (B) is decreased to 20 percent annually. Implementation of this project would reduce GHG emissions from the refrigeration and condensing units at this supermarket by 20 percent.

$$A = \frac{(20\% - 25\%)}{25\%} = -20\%$$

Quantified Co-Benefits

None.

R-7. Reduce Disposal Emissions

GHG Mitigation Potential

Up to a 99.9% reduction in GHG emissions during disposal

Co-Benefits (icon key on pg. 34)

None

Climate Resilience

Non-applicable

Health and Equity Considerations

Non-applicable

Measure Description

This measure reduces emissions from the disposal of refrigeration and A/C equipment at the end of its lifetime. Safe disposal requirements are included in U.S. EPA regulations (40 C.F.R. 82(F)) under Section 608 of the Clean Air Act, as well as under California's Refrigerant Management Program. These requirements are designed to minimize refrigerant emissions when equipment is disposed. Refrigerants must be properly recovered using U.S. EPA-certified refrigerant recovery equipment, meaning that a least 90 percent of the refrigerant must be recovered if the compressor is operating, and at least 80 percent must be recovered otherwise (U.S. EPA 2019).

Scale of Application

Project/Site

Implementation Requirements

This measure aims to capture the remaining amount of refrigerant that is not mandated to be recovered. Refrigerants must be reclaimed by an U.S. EPA-certified reclaimer for reuse or destroyed using approved destruction methods (U.S. EPA 2018).

Cost Considerations

The main cost is labor associated with hiring a technician to complete the recovery work.

Expanded Mitigation Options

Smaller equipment tends to have the highest disposal leak rates. Target this measure to small equipment to maximize GHG reductions.

GHG Reduction Formula

$$A = \frac{B - C}{C}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from disposal emissions	0–99.9	%	calculated
User Inputs				
B	Improved equipment disposal emissions rate with measure	[ ]	%	user input
Constants, Assumptions, and Available Defaults				
C	Equipment disposal emissions rate without measure	At least 20	%	U.S. EPA 2018

Further explanation of key variables:

- (B) – The improved disposal emissions rate of the equipment after implementation of improved refrigerant recovery technologies.
- (C) – The disposal emission rate of refrigeration and A/C equipment. Refrigerant must be properly recovered using U.S. EPA-certified refrigerant recovery equipment, meaning that at least 80 percent must be recovered (U.S. EPA 2018). This means the regulated disposal emissions rate would be at least 20 percent. The actual achieved-in practice rate may be much higher than this minimum requirement and could exceed 50 percent. The user should replace this default in the GHG reduction formula if they are able to provide a project-specific value.

GHG Calculation Caps or Maximums

(B<C) In order for implementation of this measure to result in a GHG reduction, the improved equipment disposal emission rate must be less than the 20 percent required by federal and state regulations. For residential equipment, reducing disposal emissions from over 50 percent to 25–30 percent is considered adequate.

Example GHG Reduction Quantification

The user reduces disposal emissions by implementing more technologically advanced refrigerant recovery systems. The initial disposal rate of the equipment (C) is 20 percent and the improved disposal emission rate with the project (B) is 10 percent. Implementation of this project would reduce disposal emissions by 50 percent.

$$A = \frac{(10\% - 20\%)}{20\%} = -50\%$$

Quantified Co-Benefits

None.

Sources

Miscellaneous

This sector includes several measures that will reduce GHG emissions through the implementation of novel or offsite projects defined by the user. The general quantification framework for three measures is outlined in this section, although all require users to identify the expected GHG reductions that will be achieved by the measures. Use the below graphic to click on an individual measure to navigate directly to the measure's factsheet. *Supporting or Non-Quantified GHG Reduction Measures* includes two additional measures in the miscellaneous sector that target environmentally responsible purchasing and funding for incentives.

M-1. Establish a Carbon Sequestration Project

GHG Mitigation Potential

Varies

Variable reduction in GHG emissions

Co-Benefits

Varies

Climate Resilience

Climate resilience benefits vary by sequestration project; for example, investing in a tree-planting project could provide heat reduction, flood prevention, and ecosystem benefits to areas surrounding the project.

Health and Equity Considerations

Local carbon sequestration projects should be prioritized, if possible, to create local co-benefits in pollution reduction and job creation. Consider including a local hiring provision (see *Inclusive Economy* measures in Chapter 5, *Measures for Advancing Health and Equity*).

Measure Description

This measure will establish a carbon sequestration project. Carbon emissions are sequestered by embedding the carbon in a structure that will hold the emissions and keep them out of the atmosphere. Sequestration can happen through biological, chemical, or physical processes.

Scale of Application

Project/Site and Plan/Community.

Implementation Requirements

Projects might include (a) geologic sequestration or carbon capture and storage techniques in which CO_2 from point sources, such as power plants and fuel processing plants, is captured and injected underground; (b) novel techniques involving advanced chemical or biological pathways; or (c) technologies yet to be discovered.

Cost Considerations

Carbon sequestration projects can cover a wide range, with the high-cost option being constructing carbon capture and storage facilities. The potential for these projects to achieve long-term costs savings depends on the type and project-specific circumstance.

Expanded Mitigation Options

Non-applicable.

GHG Reduction Formula

A = -B

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	GHG reduction from sequestration project	[ ]	MT CO_2e	calculated
User Inputs				
B	Amount of CO_2e sequestered	[ ]	MT CO_2e	user input
Constants, Assumptions, and Available Defaults				
	None			

Further explanation of key variables:

- (B) – The amount of the sequestration must be defined by the user and should be quantified using a published carbon offset protocol or one of the California Climate Investments quantification methodologies.[28]

GHG Calculation Caps or Maximums

None.

Example GHG Reduction Quantification

The user reduces GHG emissions by funding and implementing a carbon sequestration project. In this example, a biomass plant is revitalized to use oxy-combustion technology to capture CO_2 from the biomass waste gasification process. The project achieves an annual emissions reduction of 1,500 MT CO_2e.

$$A = -1{,}500 \ \frac{\text{MT } CO_2e}{\text{yr}}$$

Quantified Co-Benefits

Depending on the type, a sequestration project could achieve improved air quality, water conservation, or improved ecosystem health. The protocol used to quantify GHG reductions by the user may include methodologies or recommendations for quantifying these co-benefits.

Sources

- None.

[28] CARB approved compliance offset protocols for various project types are available on CARB's website here: https://ww2.arb.ca.gov/our-work/programs/compliance-offset-program/compliance-offset-protocols.

M-2. Establish Offsite Mitigation

GHG Mitigation Potential

Variable reduction in GHG emissions

Co-Benefits

Varies

Climate Resilience

Climate resilience benefits vary by offsite mitigation project; for example, investing in a community energy efficiency retrofit program could reduce electricity consumption, minimizing risks of a power outage during peak loads. These programs could also reduce energy costs, particularly if extreme heat would otherwise increase these costs. If the program reduces residential or commercial natural gas consumption, it could reduce consumer sensitivity to fuel price shocks or scarcity.

Health and Equity Considerations

Local offsite projects should be prioritized, if possible, to create local co-benefits in pollution reduction and job creation. Consider including a local hiring provision (see *Inclusive Economy* measures in Chapter 5, *Measures for Advancing Health and Equity*).

Measure Description

This measure will reduce GHG emissions by funding and implementing emissions reduction actions that are not directly associated with the project or located on the project site. These actions could occur within the surrounding community, or elsewhere in the city, county, state, nation, or globe. This measure should only be pursued when all possible onsite measures have been implemented or deemed infeasible. Local reductions (i.e., reductions from GHG reduction projects nearest to the project) should be prioritized, to the extent feasible.

The geographic priority for offsite reductions should be as follows: in the community affected by the project, within nearby communities with existing disproportionate burdens, within the general nearby community, within the region, within California, and then outside California.

If GHG reduction credits (including carbon offsets) are purchased for a project, it is recommended that all GHG credits/offsets, including those outside of California, meet the six criteria defined in *17 C.F.R. Section 95802*, which are used in the California Cap and Trade System, which are that the credit/offset must be "real, additional, quantifiable, permanent, verifiable, and enforceable." All use of GHG reduction credits should be from sources that follow rigorous protocols and third-party verification.

Scale of Application

Project/Site and Plan/Community

Implementation Requirements

This measure should only be pursued as a last resort when all possible onsite measures have been implemented or deemed infeasible.

Cost Considerations

Offsite mitigation projects can cover a wide range, from low-cost options like financing community building energy efficiency improvements to high-cost options like funding utility-scale renewable energy infrastructure. The potential for these projects to achieve long-term costs savings depends on the type and project-specific circumstance.

Expanded Mitigation Options

Non-applicable.

GHG Reduction Formula

$A = -B$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	GHG reduction from the offsite mitigation	[ ]	MT CO_2e	calculated
User Inputs				
B	Amount of CO_2e reduced by the mitigation	[ ]	MT CO_2e	user input
Constants, Assumptions, and Available Defaults				
	None			

Further explanation of key variables:

- (B) – The amount of the GHG reduction achieved by the offsite mitigation must be defined by the user. Users should establish a method for registering and verifying the GHG emissions reduction and ensure it meets the six offset criteria defined in *17 C.F.R. Section 95802*. These criteria ensure the mitigation would not subsidize or take credit for emissions reductions that would have occurred regardless of the mitigation.

GHG Calculation Caps or Maximums

None.

Example GHG Reduction Quantification

The user reduces GHG emissions by funding and implementing offsite mitigation. In this example, the user collaborates with a non-profit organization to fund removal of dead, diseased, and dying trees, which are converted to transportation fuels through pyrolysis. The project achieves an annual emissions reduction of 500 MT CO_2e.

$$A = -500 \frac{\text{MT } CO_2e}{\text{yr}}$$

Quantified Co-Benefits

Depending on the type, offsite mitigation projects may have no co-benefits or achieve a considerable number. For example, offsite mitigation projects that involve removing or retrofitting combustion sources could achieve improved air quality, energy and fuel savings, and improved public health.

M-3. Implement an Innovative Strategy for GHG Mitigation

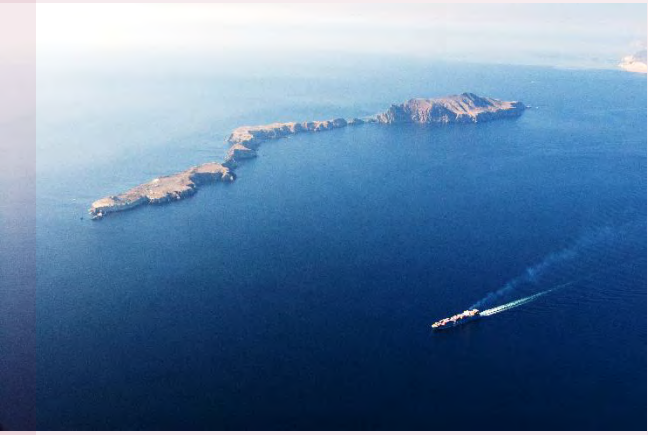

Photo Credit: Robert Schwemmer, July 2009

GHG Mitigation Potential

Variable reduction in GHG emissions

Co-Benefits

Varies

Climate Resilience

Climate resilience benefits would vary by the strategy; however, any strategies that reduce costs; improve air, water quality, or public health; increase system redundancy or reliability; reduce water use; or reduce the urban heat island would have resilience benefits.

Health and Equity Considerations

Similar to climate resilience benefits, any health and equity benefits would depend on the specific strategy and actions taken.

Measure Description

This measure will develop and implement a novel strategy to reduce GHG emissions at the project site or off site. This measure may incorporate technologies which have yet to be developed at the time of the publication of this Handbook. Alternatively, this measure may also bring together multiple measures from this Handbook into a cohesive program or mechanism to facilitate the reduction of GHG emissions, such as development of a "VMT bank" that offers community-scale VMT measures that would not otherwise be available to individual land use projects.

It is recommended that all strategies or projects implemented under this measure meet the six criteria defined in *17 C.F.R. Section 95802*, which are used in the California Cap and Trade System, which are that the GHG reductions must be "real, additional, quantifiable, permanent, verifiable, and enforceable." Quantification of emission reductions achieved by new strategies or projects should be from sources that follow rigorous protocols and third-party verification.

Scale of Application

Project/Site and Plan/Community

Implementation Requirements

See measure description.

Cost Considerations

A GHG mitigation strategy may be a low-cost way for a local government to encourage emission reduction activities across many levels of a community. Costs from developing and implementing the strategy are primarily related to staff time and document production. Costs and savings achieved by the strategy would vary depending on the action.

Expanded Mitigation Options

Non-applicable.

GHG Reduction Formula

$A = -B$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	GHG reduction from the strategy	[ ]	MT CO_2e	calculated
User Inputs				
B	Amount of CO_2e reduced	[ ]	MT CO_2e	user input
Constants, Assumptions, and Available Defaults				
	None			

Further explanation of key variables:

- (B) – The amount of the GHG reduction achieved by the mitigation strategy must be defined by the user. To take quantifiable credit for this measure, the user must provide detailed and substantial evidence showing the quantification and verification of the GHG emissions reduction.

GHG Calculation Caps or Maximums

None.

Example GHG Reduction Quantification

The user reduces GHG emissions by funding and implementing an innovative GHG reductions strategy. In this example, the lead agency for a new development project collaborates with a local air quality management district and CARB to fund a project that achieves an annual emissions reduction of 2,000 MT CO_2e.

$$A = -2{,}000 \ \frac{\text{MT } CO_2e}{\text{yr}}$$

Quantified Co-Benefits

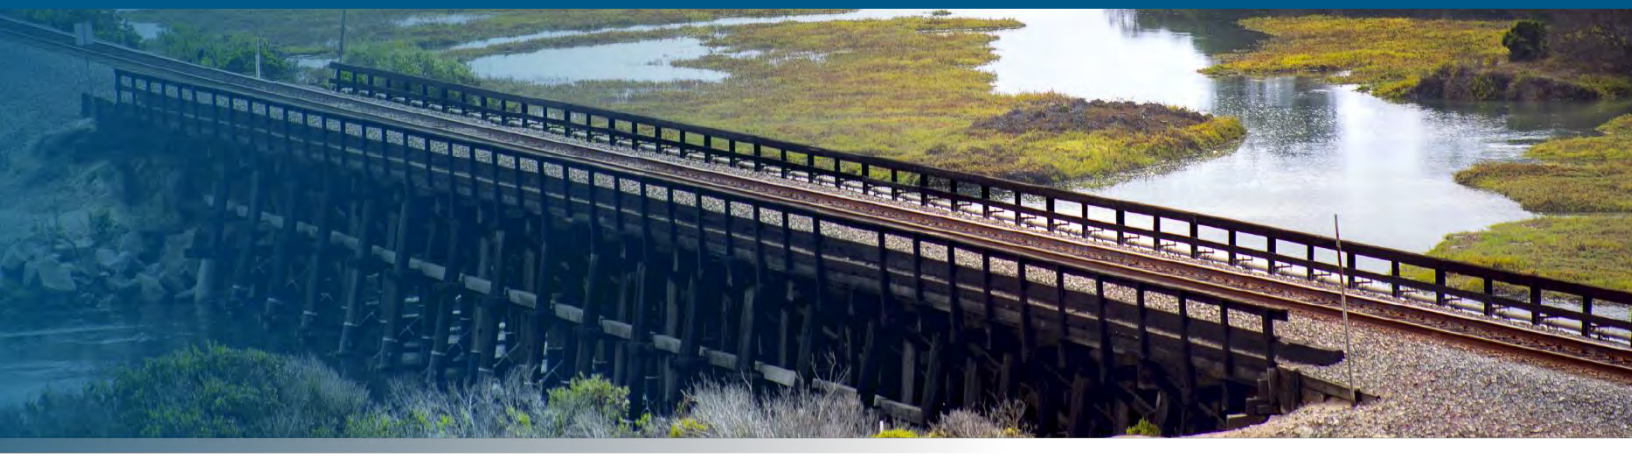
Depending on the type, mitigation projects may result in none of the identified co-benefits or achieve several of them. For example, mitigation projects that involve removing or retrofitting combustion sources could achieve improved air quality, energy and fuel savings, and improved public health. This quantification methodology does not quantify the co-benefits from these projects.

Sources

- None.

Assessing Climate Exposures and Measures to Reduce Vulnerabilities

CHAPTER 4



Introduction

This chapter provides a method to assess the potential benefits of different climate risk reduction measures at the project level. The climate exposures, sensitivities, and adaptive capacities of a project or asset all influence their vulnerabilities to current and expected impacts of climate change. This chapter presents a step-by-step process to identify and score these variables. These scores should be used to establish an initial vulnerability score, which will allow users to identify priority vulnerabilities, as well as measures to reduce these vulnerabilities. This chapter also provides descriptions of climate vulnerability reduction measures and guidance for assessing adaptive benefits of selected measures.

Climate change has already profoundly affected California's natural resources, communities, and infrastructure, and will continue to do so in the future. Existing and future developments must consider climate change in their planning processes to adequately prepare for anticipated hazards and risks. This chapter guides users through estimating their project's site- or regional-level climate vulnerability, as well as selecting risk reduction measures to address those vulnerabilities.

B3 Attach #1 of 3

The *Adaptation Planning Guide* (APG) is the state's comprehensive guidance for assessing climate vulnerability at the local level. The APG is hosted on the California's Governor's Office of Planning and Research's (OPR) Resilient-CA website, where additional materials and local adaptation case studies can also be found. Resilient-CA is regularly updated as new climate vulnerability assessments are completed. To ensure alignment with the state's overall approach to vulnerability assessments, this chapter follows the structure and processes outlined in the APG, which was last revised in 2020 (OPR 2020).

The guidance presented in this chapter should be used as a starting point to help users understand and begin to analyze potential climate vulnerabilities. The methodology should not replace a full climate vulnerability assessment performed using the APG or other resources. Moreover, the scores alone should not be used to define or communicate the climate risks for a project. A climate vulnerability score of 5, for example, does not mean that a project will face certain climate catastrophe. Similarly, a score of 1 does not mean that a project will not face any climate hazards. The purpose of the Handbook scoring method is to aid users in prioritizing the most significant climate risks so that they can select appropriate risk reduction measures for their project. Users seeking a more thorough or tailored analysis should refer to the APG, the Resilient-CA website, or other resources (provided later in this chapter).

Assessing Climate Vulnerability and Risk Reduction

The step-by-step process detailed in this chapter is outlined below.

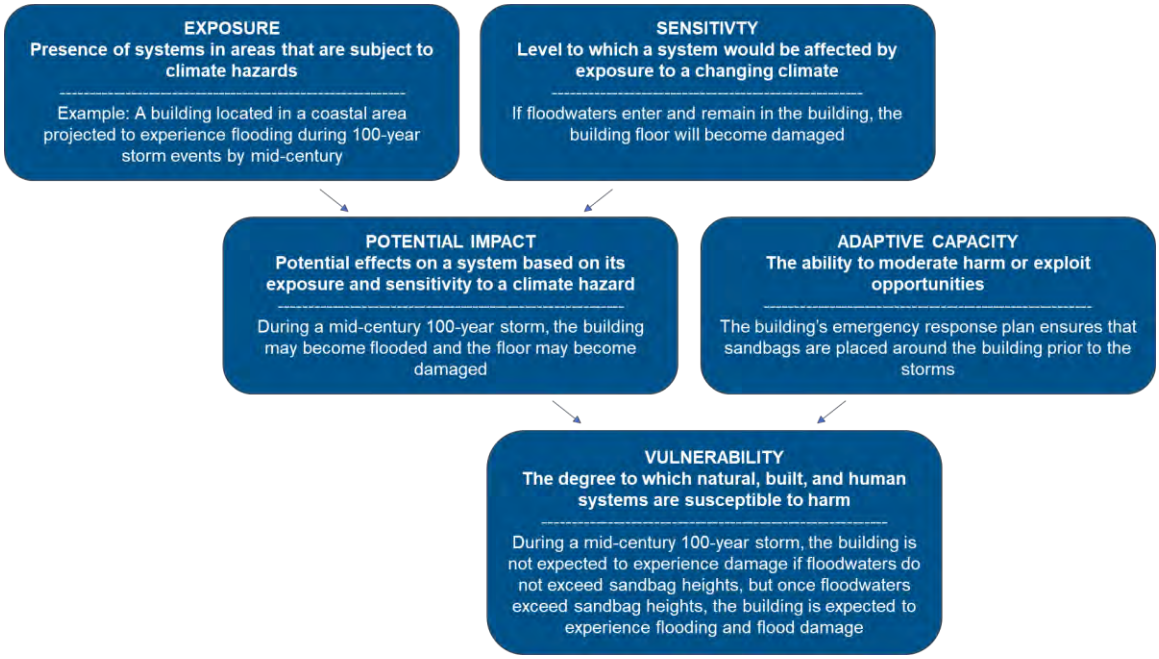
1. *Establish Initial Vulnerability Score* – this step guides the user through a high-level assessment of the contributing elements to a project's climate vulnerabilities, including exposure, sensitivity, and existing adaptive capacity to projected climate hazards. Steps for establishing the vulnerability score are as follows.
    a. Determine exposure score.
    b. Determine sensitivity score.
    c. Determine adaptive capacity score.
    d. Develop overall vulnerability score.
2. *Select Measures and Assess Vulnerability Reduction* – after establishing the initial vulnerability score, this step guides the user through selecting measures that can effectively reduce climate vulnerabilities. It also provides guidance for determining measure costs and benefits. Steps identifying and assessing vulnerability reduction measures are as follows.
    a. Select climate risk reduction measures.
    b. Identify adaptation benefits.
    c. Identify adaptation co-benefits.

Initial Vulnerability Score

Climate hazards, such as sea level rise, wildfire, flooding, and heat waves, will increasingly affect projects and project sites. The climate vulnerability of a project refers to the extent to which a project site or community is susceptible to harm from these climate hazards. In this step, users will establish a baseline for the current and projected vulnerabilities from climate hazards.

Developing an overall vulnerability score consists of combining three elements: exposure, sensitivity, and adaptive capacity. Figure 4-1 from the *California Adaptation Planning Guide* shows how these elements combine to determine climate vulnerability (Cal OES 2020).

Figure 4-1. Vulnerability Assessment Process in California Adaptation Planning Guide (Source: California's Governor's Office of Emergency Services 2020)



The following sub-steps provide guidance on developing scores to assess a project's exposure, sensitivity, and adaptive capacity. Users should first score these three components separately, using guidance provided below in the form of maps, tables, and guiding questions. Users will carry out the vulnerability scoring process in the following way.

1. Score the project's exposure to each climate hazard on a scale of 1 to 5.
2. Score the project's sensitivity to each climate hazard on a scale of 1 to 5.
3. Rate the project's adaptive capacity to each hazard using the ranking system of Low, Low–Med, Med, Med–High, and High. (Adaptive capacity is not scored from 1 to 5 to avoid confusion as the numeric scale for this component would be reversed from the scale for exposure and sensitivity.)

B3 Attach #1 of 3

4. Average the project's exposure and sensitivity scores to develop a potential impact score for each climate hazard from 1 to 5.
5. Combine the potential impact scores and adaptive capacity ratings to develop a vulnerability score for each climate hazard from 1 to 5.
6. Select the highest-scoring vulnerabilities to address as priority climate vulnerabilities.

This section also provides a *use case example* for a hypothetical affordable housing project in Los Angeles County to illustrate these sub-steps and how to arrive at a final vulnerability score. Users can follow along the example to understand how the scoring system works, what kind of project characteristics may justify a score, and how users can use their final vulnerability score to choose adaptation measures.

Determine Exposure Score

This section guides the user through the following sub-steps to determine the exposure score.

1. Identify key climate hazards based on the project site location.
2. Select initial regional exposure scores.
3. Refine initial regional exposure scores.

The following sections provide a high-level exposure map and accompanying table for users to identify key climate hazards. Guiding questions and resources to define the exposure score from 1 to 5 (with 1 being the least exposed and 5 being the most exposed) are then presented.

Identify Key Climate Hazards

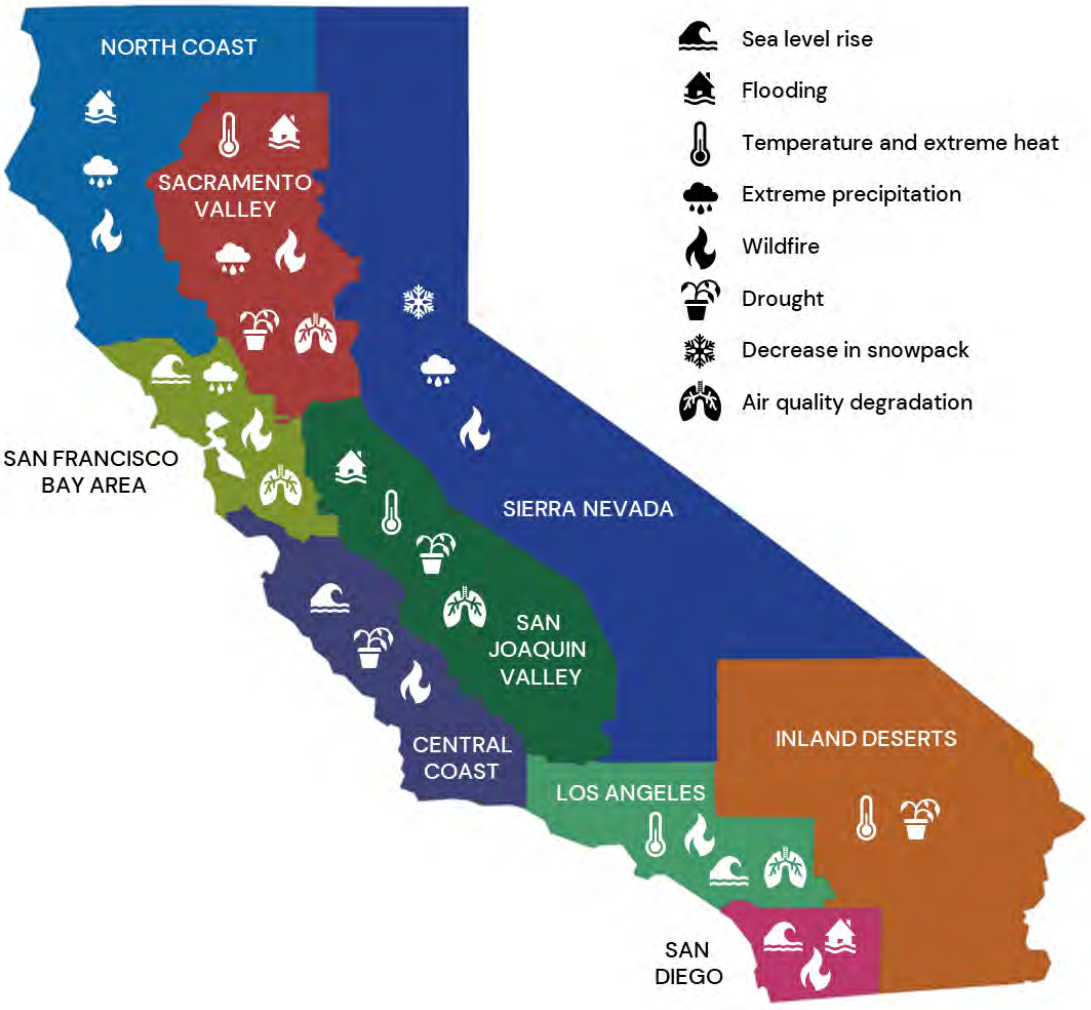
Figure 4-2 shows the nine main climate regions of California as identified in the *California Fourth Climate Change Assessment* (Bedsworth et al. 2018).

Identify the climate region in which the user's project is located (Figure 4-2).

Use Case Example: The project is in the Los Angeles Region.

B3 Attach #1 of 3

Figure 4-2. Illustrative Climate Hazards in Nine Climate Regions of California under the California Fourth Climate Change Assessment



Select Initial Regional Exposure Scores

For each of the nine regions, the *California Fourth Climate Change Assessment* identifies the most significant climate hazards, summarized in Table 4-1, along with initial regional exposure scores that allow users to screen for the hazards of greatest concern to their geography. These initial regional scores are based on an analysis of Cal-Adapt and the *California Fourth Climate Change Assessment's* summaries of the most relevant climate hazards in each region. Where given, a range reflects how much the vulnerability to climate change can vary within that region. For example, sea level rise does not occur everywhere in San Francisco (score of 1), but it can be a significant vulnerability (score of 5) for coastal areas.

B3 Attach #1 of 3

Locate the climate region for the user's project in Table 4-1 and record the initial regional exposure score for each hazard.

Table 4-1. Initial Regional Climate Hazard Exposure Values [a]

Region	Sea Level Rise	Flooding	Temperature and Extreme Heat	Extreme Precipitation	Wildfire	Drought	Decrease in Snowpack	Air Quality Degradation
Central Coast	1–5	1–2	1–5	1–5	1–5	3–4	1–2	1–2
Inland Deserts	N/A	1–2	1–5	1–5	1–5	3–5	1–2	2–4
Los Angeles	1–5	1–3	1–5	1–5	1–5	4–5	2–3	3–5
North Coast	1–5	2–3	1–5	1–5	1–5	3–4	3–4	1–2
Sacramento Valley	N/A	3–4	1–5	1–5	1–5	3–4	2–3	3–4
San Diego	1–5	2–3	1–5	1–5	1–5	3–4	1	3–4
San Francisco Bay Area	1–5	2–4	1–5	1–5	1–5	2–4	2–4	3–4
San Joaquin Valley	N/A	2–3	1–5	1–5	1–5	3–5	2–4	2–3
Sierra Nevada	N/A	3–4	1–5	1–5	1–5	3–4	5	1–3

[a] Within the CalEEMod tool, some hazards (sea level rise, temperature and extreme heat, extreme precipitation, and wildfire) are evaluated in regional quantiles using Cal-Adapt data; to ensure consistency between this Handbook and CalEEMod, these four hazards have a score range of 1 to 5 here. The score range for the remaining four hazards (flooding, drought, decrease in snowpack, and air quality degradation) are based on a comparison of relevant hazards summarized in the *California's Fourth Climate Assessment* regional reports.

Use Case Example: The following climate hazards and initial regional exposure scores are applicable for the Los Angeles region.

- Sea level rise: 1–5
- Flooding: 1–3
- Temperature and extreme heat: 1–5
- Extreme precipitation: 1–5
- Wildfire: 1–5
- Drought: 4–5
- Decrease in snowpack: 2–3
- Air quality degradation: 3–5

Based on these initial regional scores, significant region-wide climate hazards for the Los Angeles region include sea level rise, temperature and extreme heat, extreme precipitation, wildfire, drought, and air quality degradation.

B3 Attach #1 of 3

Refine Initial Regional Exposure Scores

Where Table 4-1 offers a range (e.g., 1–3) for a climate hazard exposure score, users can refine that range to a single score that is more specific to a project location. Table 4-2 provides key questions and considerations users could use to refine their exposure scores for their region. For example, a user with a site in the San Francisco Bay Area within the Coastal Zone Boundary that has experienced coastal flooding in the past should consider a "5" hazard rating for sea level rise.

Table 4-2 also indicates whether each question refers to a project area's past or potential future climate exposure. This distinction is important because susceptibility to climate hazards in the past is one factor indicating susceptibility to climate hazards in the future. However, the lack of past exposure does not mean future climate hazards will also be the same. As the climate changes, the frequency and severity of climate impacts increase, and climate risk areas extend beyond historic boundaries. Users should keep this in mind as they refine the initial exposure scores.

Table 4-2. Guidance Questions for Refining Initial Climate Hazard Exposure Scores

Past vs. Future	Question	User Answer	Exposure Score
Sea Level Rise			
Past	Has the project area experienced flooding in the past?	Yes	High
		No	Low–Med
Future	Is the project area projected to experience flooding under future sea level rise?	Yes	High
		No	Low–Med
Flooding			
Past	Is the project located in a 100-year Federal Emergency Management Agency (FEMA) floodplain?	Yes	High
		No	Low
Past	Is the project located in a 500-year FEMA floodplain?	Yes	Med
		No	Low
Past	Has the project area experienced flooding in the past?	Yes	High
		No	Low–Med
Future	Is the project area projected to experience an expansion in flood risk areas, increased flood depths, or increased extreme precipitation events?	Yes	High
		No	Low–Med
Temperature and Extreme Heat			
Past	Is the project located in an urban heat island? (Is the project located in a dense urban or suburban environment?)	Yes	High
		No	Med
Future	Is the project area projected to have higher projected temperature and extreme heat values compared to the region as a whole?	Yes	High
		No	Low–Med
Extreme Precipitation			
Past	Has the project area experienced extreme precipitation (e.g., over the 95th percentile) in the past?	Yes	High
		No	Low–Med
Future	Is the project area projected to have higher extreme precipitation values or changes in extreme precipitation compared to the region as a whole?	Yes	High
		No	Low–Med

B3 Attach #1 of 3

Past vs. Future	Question	User Answer	Exposure Score
Wildfire			
Past	Is the project located in the wildland–urban interface (WUI) (as defined by CAL FIRE hazard and/or county WUI maps)?	Yes	High
		No	Low
Past	Is the project in or near an area that experiences high wind events?	Yes	High
		No	Low–Med
Past	Is the project area composed of vegetation that could serve as significant wildfire fuel?	Yes	High
		No	Low–Med
Past	Has the project area experienced wildfire in the past?	Yes	High
		No	Low-Med
Future	Is the project area projected to have higher wildfire risk compared to the region as a whole?	Yes	High
		No	Low–Med
Drought			
Past	Has or does the project area's local government impose water conservation requirements beyond the statewide requirements?	Yes	High
		No	Low-Med
Past	Has the project area experienced curtailments in water deliveries from local surface or groundwater sources in the past?	Yes	High
		No	Low-Med
Past	Has the project area ever been identified in a state drought emergency declaration?	Yes	High
		No	Low-Med
Future	Is the project area projected to experience an increase in the frequency or severity of drought in the future?	Yes	High
		No	Low-Med
Decrease in Snowpack			
Past	Does the project rely on annual snowfall directly (e.g., recreation facility relying on snow)?	Yes	High
		No	Low-Med
Past	Does the project depend on water sources that vary annually based on snowpack?	Yes	Med
		No	Low
Future	Is the project area projected to experience a decrease in future snowpack?	Yes	High
		No	Low-Med
Air Quality Degradation			
Past	Is the project area within a nonattainment area for federal or state ambient air quality standard?	Yes	High
		No	Low
Past	Is the project area within 0.25 mile of a major freeway?	Yes	High
		No	Low
